Learn How to Make Money Out of Skins

Our TRAPPERS' GUIDE is just the book you need, whether you are an old-time trapper or inexperienced. Ask for it. We will send it free. It tells you when, where and how to trap, giving the game laws of every State and Canada. Tells you how to prepare skins, and how to get the most money for them. Reveals carefully guarded traping secrets and gives methods that will increase the catch every time, no matter how long you have been trapping or what your experience. The facts as to Animal Baits have never been published before—are as important to a trapper as traps. Write today for this valuable, but free book.

Placentia Perfection Walnuts
Grafted on California Black
Eucalyptus Trees and Seed
Sunset Nurseries, Tropico, Cal.

as does the Santa Barbara Softshell, Placentia Perfection or the many partially blight resistant nuts which are now used for grafting. In Santa Paula we do not think we would plant Franquettes. If grafted they bear at about the same age as the ordinary softshell nut and, as noted, in the sections north, are good producers.

Grain With Alfalfa.

Notice in the Cultivator advantage claimed to be gained by adding grain ration to alfalfa pasture. Would like to know profits from acre of alfalfa or one used as pasturage for hogs; also as to whether lamb feeding has been tried on alfalfa.—J. N. O., Spadra.

While hogs will grow on alfalfa they will not fatten very quickly. We find it pays to push them along by giving a small amonut of grain in order to fit them for the market as quickly as possible. Sows with the little pigs need a little grain but as soon as the pigs are weaned they will grow well if fed alfalfa green or as hay with the skim milk ration. Eight hogs will grow up well to the acre of alfalfa and if not allowed to run on it all the time will probably not use it all. In other words, sixteen hogs on an acre until it is eaten close and then put on another acre will usually leave one or two cuttings in the flush season growth to make into hay. The profits of hogs are like everything else, large, if well handled and prices are high, nothing if disease strikes the bunch or if price drops to three cents on foot. Lamb feeding would pay well, if near enough to large market to secure good prices. The only thing in that case is to find the market. We have on this ranch too much trouble with neighbor's dogs to make sheep profitable in a small way.—M. E. S.

Eucalyptus from Seed.

How may I start eucalyptus trees from seed —O. S., Reedley.

Eucalyptus seeds are planted in flats or shallow boxes four inches deep. Fill these with the ordinary soil well pulverized and let them stand until the next day after having sprinkled it well with a fine nozzled sprinkler. The soil may be too heavy and in that case a layer of sand or fine road dust of half an inch over the top of the heavy soil will help the little trees. Then take a small stick and draw it across the box every inch and sow the seeds i these tiny furrows, water again and the water will wash in enough soil to cover the seeds. Put the boxes in a shady place, well protected from the birds. Water from time to time as the tiny plants need it. When they begin to form the second leaf, go over the boxes with a sharpened stick lifting out any that stand out of the rows and thinning so that the plants stand an inch apart. The plants removed are set at once into other prepared boxes. They are easier raised if the seed is sown in June and the boxes put under lath houses. The only trouble that attacks them is damping off. This comes in wet weather and attacks the plant by drying up the tiny stem and the plant falls over and dies. In September the plants may be potted off into cans and then hardened off in March and planted out in April.—M. E. S.

Bloat.

Cow bloated badly on alfalfa. Had to stick her to save her life. How long will it require for healing? In the future can I use anything in the drinking water which will prevent bloat?—J. H. R., Yuma.

A cow that is stuck with a clean knife never seems to suffer any discomfort from the operation. We put on a little pine tar on the place. This comes in cans and had best be purchased at the grocer's. We add to the cows' feed when they are disposed to bloat much, a tablespoonful of baking soda and also throw a very small piece of lime into the watering troughs. A piece about as big as a walnut to each hundred gallons of water will harden the water without making it too strong for the cows to drink.—M. E. S.

New High Grade Automobiles

at Prices Lower Than the Price of Medium Grade Cars

To Prospective Automobile Buyers:

You naturally wish to purchase the highest grade car you can get for your money, and you naturally want a higher grade car than the dealer can afford to sell you for the amount of money you wish to pay—we will meet your views for a short time.

We have a limited stock to dispose of—all high grade—and all prices to meet the needs of moderate priced car buyers.

Whiting, Davis and Westcott Cars
in Two and Five-Passenger Models

These are not shopworn cars, they have never been driven a mile, and are the latest models received.

We have sold the lease of our garage and have not at present the necessary equipment and room at our store to properly handle automobiles, so we offer you the opportunity to buy a car of higher grade than you ever thought of owning and at a price no higher than is charged for a medium grade car.

Call at Newell Mathews Company, 200 North Los Angeles Street, Los Angeles, Cal., or write us, stating whether you wish to buy a one-seat or two-seat car and we will send you full information or have our salesman call.

00 Union Trust Bldg., Los Angeles, Cal.

FARM LANDS FOR SALE.

Owens Valley Lands—Those who have written us regarding our lands, we wish to advise that the railroad is now completed and that the cost and time of going into the Valley is greatly reduced. Instead of an expense of $30.00, you can make the round trip, spending two days on our land and seeing the country thoroughly, for a total cost of $19.00, which will be refunded to you in the event you purchase. We urge upon the California farmer, who is considering a change of location, not to waste any time in investigating Owens Valley. The possibilities of this wondrous district are far beyond anything in California. It is not necessary for us to use bumper crops of one successful farmer to tell of the wonderful resources of this Valley. From 250 to 500 bushels of potatoes, from 60 to 90 bushels of corn is the general run. The choicest apple districts of Oregon, Washington or Colorado are not one bit superior to Owens Valley, where you can buy today the very best foothill apple land we have, with a perpetual water right, in steel and concrete mains, at $150 per acre, while the same land in the Northern States would cost you $600. There is no experiment about the Owens Valley as an apple country. The trees have been there for 40 years. Expert apple orchardists from the Rogue River, who examined the land in the Owens Valley this summer, contend that their former home never produced Wine Saps and Spitzenburgs equal to what they saw. The climate in Owens Valley is superior to anything in California, outside of the seashore. The hottest day in nine years was 102 deg. This last summer the thermometer ran to 100 deg. on two occasions. The winters get as low as 10 deg. above, but all farmers contend they work in their shirt sleeves all winter, the cold period only being in the early morning. You should write this office and let us send you an assortment of pictures, maps and complete descriptions. Our printed matter will give you a very complete story of all the conditions in the Valley. The man who lost his opportunity in buying Southern California lands when they were $150 an acre has the same opportunity awaiting him in Owens Valley. If you are in the city, do not fail to call at our office and see the exhibit of apples, corn, onions, potatoes and all grains, which you will acknowledge are superior to anything you believed California could raise. Owens Valley Improvement Co. James R. H. Wagner—H. S. Cook, Sales Agens, Room 13, 329 South Hill St., Los Angeles, Cal.

Tulare County Dairy Ranches Pay—I have several very attractive propositions in lands adapted to dairying, alfalfa, hogs and cattle. Some of them with artesian wells and pumping plants. Immense body of surface and artesian water underlaying the surface from 12 to 20 feet. On main line railroad. Close to town and schools. Telephone and electric lines near. Some improved places. Values are increasing fast but I can show you property with some improvements at $40.00 and up. Also have cheaper land that contains some fine alfalfa land and balance grazing. C. H. Biggin, Pixley, Tulare Co., Cal., or 1813 S. Union Ave., Los Angeles.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

For Sale—815 acres in San Luis Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. Forty acres of land suitable for these. Price $21 per acre. For further particulars apply to Mrs. F. A. Clink, Pozo, Cal.

40 or 80 Acres Land adapted to alfalfa, almonds, oranges. Sandy loam soil with some gravel. Adjoins the Government Model Irrigation Project and is an ideal pumping proposition; water at 20 feet. 3 miles from growing town and best roads in California. Will sell at a price that will double in 2 years. One 40 acres improved; other in pasture. C. M. Baldwin, Orland, Glenn Co., Cal.

For Sale—3¾ acres. Nursery, chicken ranch and delightful home place; heart of thrifty town; modern 6-room house and bath; 12 chicken houses, large brooder house, horse and buggy, considerable nursery stock, trees, shrubs, flowers; snap for someone; $6000.

20 acres vigorous, young eucalyptus grove, 1000 trees per acre; all necessary watering done; situated in a nearby town; $35 per acre is very cheap for this grove. Parrish Barker, 207 Union Trust Bldg., Los Angeles.

For Sale—5-acre chicken ranch, ¼ mile from Petaluma, 5-room house, brooder house, windmill and tank, all new. Fine well of water, also fine view of surrounding country. Cow, horse, wagon, and 900 laying hens go with place. Net income last year over $1,000. Price $4,500, if taken before the first of January. Call or address A. B. Smith, Bodega Ave., Petaluma, Cal.

Reliable Information Furnished of improved dairy ranches and raw land, in the well known Modesto and Turlock Irrigation District, by a successful rancher that has been running a dairy ranch for five years near Modesto. I have cut six good crops alfalfa this year. We have two large creameries in Modesto that are putting out 6,000 lbs. of butter a day; also a large alfalfa meal mill. Address Box 54, Modesto, Cal.

For Sale—El Cajon Grant Land. In the heart of El Cajon Valley, 30 acres of choice vineyard, large house, cottage and barn; trays, boxes, etc. Close to proposed electric line. S. B. Hawley, 1548 D St., San Diego. Cal.

For Sale—Farm of about 57 acres in the Chehalis Valley. All cleared and under cultivation, including horses, stock, launch, and farm implements. For particulars address Fred Pearson, Box 1034, Montesano, Wash.

Irrigated Land—The famous Gridley Colonies. Improved lands, best homeseekers' proposition in California. Write for particulars. Gridley Land Co., Gridley, Cal.

The Best Buys in farm lands in Central California can be had through us. Call or write Sterling Securities Co., Savings & Loan Bldg., Stockton, Cal.

FARM LANDS FOR SALE.

Irrigated Land For Sale, Cheap—In the Lower Rio Grande Valley of South Texas. Ideal climate. Good markets. Large crops. Special inducements to several practical irrigation farmers. Address Manager, American Rio Grande Land & Irrigation Co., Mercedes, Hidalgo County, Texas.

Five and Ten-Acre Tracts—38 miles from Los Angeles. Deep, rich soil, abundance of water, suitable for beans, berries, garden truck, tomatoes, walnuts, corn, apples, and all fruits, flowers, etc. Grand for poultry. $300 per acre, one-fifth cash, balance 6, 12, 18 and 24 months, or longer, 6 per cent interest. Inquire Geo. W. Lazenby, 211½ Pine Ave., Long Beach, Cal.

For Sale—240 acres of good land in Mariposa County; 50 acres clear, balance easily cleared; suitable for a hog ranch, grain or apple orchard. Plenty of water; 3 miles of good fences; good buildings. Price $2,200. For further particulars, address C. Gliszinski, Los Angeles, Cal. Gen. Dely.

The difficulty of securing the money needed for an adequate system of improved roads is more seeming than real. If our present tax systems do not provide sufficient funds, then new taxes, levied as far as possible on those interests that will be most benefited by the increased prosperity of the farmers, must be found. It is useless for this great and wealthy country to say that the required appropriations can not be made. They must be made, and if the farmers do their plain duty they will be made at no distant day, so that we can enter as soon as possible on the enjoyment of those advantages of which we have been too long denied.

When writing advertisers, mention Cultivator.

ENTERPRISE

Meat and Food Chopper

The *only true Meat Chopper*—the only chopper that has a sharp, four-bladed steel knife and perforated steel plate that *actually cuts* meat, fish, vegetables, fruits, bread, etc, *without crushing or mangling*.

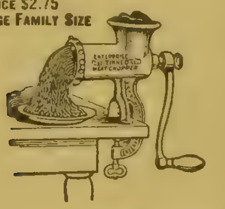
The "ENTERPRISE" is the strongest chopper made—has the fewest parts—is the simplest in construction. Easily cleaned. Cannot rust.

For Sale at Hardware and General Stores Everywhere.

No. 5, Small Family Size Chopper, $2.00. No 10 Large Family Size Chopper, price, $2 75.

"ENTERPRISE" Meat and Food Choppers are made in 45 sizes and styles for Hand, Steam and Electric Power. We also make *cheaper* Food Choppers, but recommend the above. *Illustrated catalogue FREE.*

No. 10
PRICE $2.75
LARGE FAMILY SIZE



Sausage Stuffer and Lard Press

The quickest way, the easiest way, the cheapest way to make the best sausage and lard is to use the "ENTERPRISE" Sausage Stuffer and Lard Press—two machines in one. It is an absolute necessity at butchering time.

It is strongly made and every part does its work without a hitch. Plate fits perfectly and cylinder is bored absolutely true. Pressure will not cause meat to rise above plate. The patent corrugated spout prevents air entering the casing, thus assuring perfect filling and preservation of sausage.

Can be changed into a *Lard* or *Fruit Press* in a jiffy.

Sold by Hardware Dealers and General Stores everywhere.

Write for catalogue.

VALUABLE MEAT SUBSTITUTES.

Miss Clara Palmer, at present in charge of the Domestic Science Department of the San Luis Obispo Polytechnic School, supplies the Cultivator with the following recipes, some of which are credited to their originators. These recipes were used in demonstrations made at the University Farm at Davis and those who were there and heard Miss Polmer's interesting talks will appreciate this opportunity of having copies. Miss Palmer has been connected with the school at San Luis Obispo for but a few months.—Ed.

* * *

Whether your decision to join the non-flesh eaters is founded on a principle that it is immoral to be forced into paying unreasonable prices, or on sympathy with your fellow men, who less fortunate than yourself are actually suffering from the present high prices, or on hygienic reasons; if you are going to join the non-flesh eaters you must know how to make such an intelligent substitution for meat in the diet that there shall be no loss of nutrients to the family.

The value of meat as a food to build up and nourish the body is due to three different food principles, protein, fat, and minerals. The youngest and least experienced housekeeper could supply the lack in fat, but let her consider carefully the comparative cost per pound of butter, bacon, lard, oleomargerine (which is fully protected by the pure food law and government inspection); olive oil, which is never cheap but has not advanced in price with increase in cost of other foods; and the oils of nuts and grains which are on the market at lower rates.

Protein being the most important as well as most troublesome food requirement of the body, the substitutes for meat protein involve more difficulty to the housekeeper who has never bothered her head with the composition of foods, but reference to Bulletin No. 28, of the U. S. Dept. of Agriculture, on the Chemical composition of American Food Materials, which may be had by any one for a postal card request, will furnish the necessary information without taxing the understanding of the least scientific.

For instance, considering equal weights, compare the amounts of protein in the following foods and then compare the prices per pound at your own market.

Porterhouse steak contains 19 per cent protein, or a little less than one-fifth its bulk or about three ounces of protein to a pound. The various kinds of cheese in common use range from about 19 per cent protein in Neuchatel to over 31 per cent in American skimmed milk cheese. Oatmeal contains 16 per cent, whole wheat and graham flours about 14 per cent, macaroni and similar products of the gluten flour about 12 per cent, dried beans, peas and lentils vary in protein content from 18 to 26 per cent. All nuts are high in protein, almonds 21 per cent and peanuts 26 per cent having most. Chocolate has about 13 per cent, cocoa (less fat) 22 per cent.

These amounts are computed for the materials as usually purchased, meat with bones, fat and gristle, and it is to be remembered that many cuts of meat have more refuse than the one here chosen for comparison. Nuts in the shell are estimated. For shelled nuts the rate would be very much higher.

Canned beans or peas are not to be compared with the same vegetable dried, as a large proportion of the bulk and weight is water. A can of peas contains less than 2 per cent protein.

From the above comparison it is plainly seen that cheese, nuts, macaroni and dried legumes (beans, peas and lentils) are about equal to, or even exceed meat in the amount of protein furnished pound for pound.

The various forms of macaroni combined with cheese and a white sauce make a dish which may well take the place of meat.

The milk is about 4 per cent protein. Remember cheese is to be added to any dish after the principal cooking is finished, that it may be warmed through and melted only, not subjected to prolonged nor intense heat, which renders it tough and indigestible.

White sauce, 1 T flour, 1 T butter, ¼ T salt, 1 C milk, pepper (white).

Melt butter without burning, add flour and seasoning, stir smooth, add the milk gradually stirring constantly, cook two-thirds minute until the sauce thickens and the flour is thoroughly cooked. Use with escalloped dishes of all kinds. For medium white sauce use two T each of flour and butter. For thick white sauce use 3 T each of flour and butter. (T—tablespoon.)

Cheese Salad. The soft cheese cream or Neufchatel are made into small balls, placed on crisp tender lettuce leaves and served with French dressing. A small quantity of either green peppers, pimentoes or olives, chopped, may be added for variety. Mix these into the cheese before making into balls. The food value as well as flavors and attractive appearance may be increased by the addition of chopped nuts, or a half nut may be placed on the top of each portion of cheese.

Luncheon Sandwiches.

Make sandwiches of thin slices of bread (¼ inch) placing slices of cheese (American variety) one-eighth inch between, sprinkle with a few grains of cayenne. Place on the toasting rack, brown, turn and brown. When both sides are toasted the cheese should be soft and creamy. Serve at once. These sandwiches are sometimes browned in butter in a chafing dish, but the additional fat makes them very rich.

Potatoes au Gratin.

Slice cold boiled potatoes, use half as much thin white sauce as potatoes and one-fourth the quantity of grated cheese. Arrange in a buttered baking dish, cover with crumbs and bake until well heated through and crumbs browned.

cakes and puddings increases the food value, but considering the small amount which is used could not be relied upon as a meat substitute except when combined with milk in the beverage, custard or blanc mange. Recipes for these are found in all cook books.

Besides using oatmeal, the most nutritious and valuable of all breakfast cereals, as a mush, use it occasionally moulded, chilled, sliced and browned in butter. Serve with maple syrup.

Oatmeal Macaroons.

Rub one tablespoon of butter into one-half cup of sugar, and mix with one well-beaten egg. Stir in one and one-half cups of rolled oats, one-fourth teaspoon of salt and one-half teaspoon of baking powder. Drop small shapes on greased pans, and bake in a hot oven until brown and crisp.

Oatmeal Gems are very good. Substitute cooked oatmeal for half the flour in your recipe for gems.

Oatmeal Biscuit.

One cup rolled oats, one tablespoon lard, salt. Pour on two cups of boiling water. Let it stand until lukewarm: add one-half cup of molasses and one yeast cake, and flour enough to mould. Let it rise, then shape, arise again and bake.

Besides the ever popular Boston Baked Beans, either beans or peas (dried) may be soaked, boiled until tender in salted water, chilled and served on lettuce leaves, with a highly seasoned boiled salad dressing.

Soups.

Nothing more delicious or nutritious in the way of soup can be made than a good cream of pea soup.

Pea Soup.

Cook the peas until tender, mash through a seive, add an equal amount of thin white sauce. Thin to the desired consistency with the water in which the peas were cooked. Season to taste.

Chestnut Soup.

Parboil French chestnuts, shell, boil until tender, mash through sieve, add to thin white sauce, if too thick add more hot milk. Season and serve at once.

Almonds salted in candy or cake may be served with the meal to raise the protein. Nuts of any kind or mixed may be added to fruit salads.

Cheese Pudding.

One-half pound cheese grated, 4 slices bread buttered. Line baking dish with part of bread. Add cheese, season with salt and cayenne. Cover with bread. Pour over a pint of milk. Let stand 5 minutes. Bake 20 minutes.

Rice Macaroni.

Cook macaroni in boiling water 30-45 minutes. Drain, blanch, cut into very fine rings. Make cream sauce, grated cheese and macaroni. Put in a dish. Cover top with grated cheese and bread crumbs. Brown in hot oven.

Nut Bread (Mrs. English.)

4 C flour (pastry), 1 C sugar (scant), 1 T salt, 2 T baking powder, 1 C nut meats, 1½ C milk. Sift together 4 minutes and add chopped fine. Stir to smooth dough, turn into bread tin, let stand 20 minutes, bake 40 minutes.

Tomato Rarebit.

1 lb. grated cheese, 1 C tomato (strained), 1 C stale bread crumbs. Rub sauce pan with clove of garlic. Turn in the mixture, stir rapidly until smooth and hot. Serve at once on toast.

I am unfortunately unable to give proper credit for some of these recipes because I do not remember where they were originally found.

"I wonder what the teacher meant about the singing of my two daughters?"

"What did he say?"

"He said that Mamie's voice was good, but Maude's was better still."

What we eat and how we eat it are two questions of importance.

Poverty soon overtakes a lazy man. After that they travel along together.

A Light Making Machine with a Strange Appetite

FEED IT

Crushed Stone and Water
Once a Month

and it will supply you with enough home-made gas to run thirty-five lights. Just the thing for a farm or a country place of any sort.

Makes a cheap exceptionally brilliant light—more economical than kerosene and quite as convenient as electricity. Already there are 185,000 of these machines furnishing light for as many homes.

* * *

You can set one in one corner of your cellar or in an out-building. Then all you need to do is to feed it the curious crushed stone known as "Union Carbide,"—a few pounds once a month.

The machine does the rest—automatically it brings the carbide a little at a time in contact with plain water.

The water liberates genuine acetylene gas stored in the carbide. This it does only when the lights are burning. Makes just enough acetylene to supply the lights in use and stops working when the lights are shut off.

* * *

You can have a cluster of lights in every room in the house—one in the cellar,—one in the attic,—one on the front porch,—one at the back door,—one in the shed,—one in the barn yard,— two in the horse barn (or garage, if you have one), and four in the cow barn.

With an installation of this kind, you would have positively the most efficient and safest light equipment money can buy.

The "Union Carbide" which comes to you in sheet steel hundred pound drums won't burn and can't explode.

The fixtures are permanently attached to walls and ceilings—the light flame is so stiff, wind does not affect it.

Every burner can be equipped to light with the pull of a chain—no matches required; and in addition to all this, the gas is not poisonous. —You could sleep all night in a room with an open burner and suffer no harm.

* * *

Considering these advantages, is it any wonder that the engineers of the National Board of Fire Insurance Underwriters have pronounced modern Acetylene Light Safer than any of the illuminants it is displacing?

The cost of a plant depends upon the number of rooms, barns and buildings you wish to light.

Write us how many and we will send you an estimate free, together with an intensely interesting booklet telling all about the light for home use and how it has been used successfully by Corneil University to grow plants—same as sunlight. Just address Union Carbide Sales Co., 157 Michigan avenue, Chicago, Ill., Dept. O-41.

Hay.

Scott, Magner & Miller say:

We have received on the market here during the last six days 4300 tons of hay, which is practically the same average amount that we have been receiving for the last few weeks.

A little fancy hay will bring out topmost quotations, but there has been such a trifling amount of such hay available that practically our entire arrivals have consisted of No. 1 and the medium grades of hay. The Hay Association is now gathering statistics of the total amount of hay on hand in the territory tributary to this market.

Alfalfa hay continues to maintain the position in the market that it has been in for the last few weeks, with no changes at present to note. The demand for this article has been exceptionally good.

Straw is dull and neglected, with the lightest kind of demand under present conditions.

We quote the wholesale prices in round lots on today's market as follows viz.:

Fancy wheat	12.50@13.50
No. 1 wheat or wh and o	10.50@11.50
No. 2 wheat or wh and o	9.00@10.00
Choice tame oat	10.50@11.50
Other tame oat	8.00@9.50
Wild oat	8.00@9.00
Stock hay	5.50@6.50
Alfalfa	9.00@12.50
Straw	.40@50

Grain.

Wheat, No. 1	1.45@1.50
Barley, good to choice	.95@97½
Barley, fancy	.98¾@1.00
Barley, poor to fair	.90@93¾
Oats, white	1.45@1.55
Rye, new crop	1.50@1.55
Alfalfa seed	.14@15
Mustard brown	.4½
Millet	.2½
Flaxseed	.5@5½
Broom corn seed, per ton	23.50

Feed Stuff.

Bran, per ton	29.00@31.00
Feed cornmeal, per ton	36.00@37.00
Cracked corn	36.00@37.00
Ground barley, per ton	22.00@23.00
Rolled oats, per ton	29.00@31.00
Middlings	34.00@36.00
Oil cake, per ton	40.00@41.50
Cocoanut cake, per ton	25.00
Mixed feed, per ton	24.00@27.00
Shorts	30.00@32.00

Deciduous Market

SACRAMENTO, October 29th, 1910.

The following circular of the California Fruit Distributors gives number of cars of deciduous fruit shipped from al points in California for the week days) ending Friday morning, Octobe 28th, 1910.

Pears, four cars:

An occasional car of pears still offers, but it is expected that next week will entirely clean up this variety.

Grapes, 293 cars:

Movement of this variety this weel is pretty nearly 100 cars heavier thai for last week. Tokays are now goin forward in very small volume and th bulk of the shipment is composed o Cornichons and Emperors. From th best information obtainable the tota movement from this time on can hardl be expected to aggregate more than 25 cars at the outside.

Weather conditions continue favorable and should there be no furthe rain it is expected that the crop w practically be cleaned up within th next ten days.

Citrus Market

NEW YORK, Monday, Oct. 31.—Th offerings today comprised ten cars c Valencias and two cars of lemons. Tru to last week's warning and predictior the market did just as expected. Th liberal offering on the first sale of th week, together with last week's supply, depreciated values and produced dull, sluggish sale with prices generally easier and lower. The critical stat of the market at this season of th year, together with the fact that value were hovering practically at the lim made it plainly apparent that the leas over-supply would cause a decline an prices today prove it.

The Valencia situation is now ver critical and the prospects for its re turning to its former heights are ver dubious, unless the market gets a goc chance to clean up and moderate offerings are maintained until the clo of the season.

Two cars of lemons were sold toda and prices obtained, although fairl good, show that the keen edge has di appeared. The lemon outlook is sti favorable for a short time, in limite supply, as the new crop Sicily lemo will begin to arrive in about tw weeks.

Oranges are rather scarce. Old Californias are about cleaned up and there re but very few new coming. The market is in a healthy condition. Boxes, ate Valencias, extra choice, $5.00@.50; choice, $4.75@5.25.

Business Notes

VALUABLE OPPORTUNITY.

Cheap lumber and other building material is desirable, providing the cheapness is in price and not in quality. It is possible to get most desirable materials at the lower price through some of the large wrecking companies in cities where large buildings are giving place to the newer steel structures. One of the biggest of these concerns is the Diamond Lumber and Wrecking Company, corner Seventh and Central, Los Angeles. These people offer plate glass doors, tables, counters, bath tubs—the latter at one-third the ordinary price—plumbing of all kinds, both new and second hand and even roofing paper which is guaranteed, and all at a very low price. As an instance, we may mention that this firm is now offering shingles, full counts, at $2.00 per thousand. In addition, to maintain the low price feature, the concern offers new lumber at $15.00 per thousand. This is an excellent opportunity for those contemplating building to get rock bottom prices.

The Mammoth Hatchery of 3017 South Main street, Los Angeles, of which P. Cook is proprietor has issued its new season's price list and catalogue. It not only contains facts regarding Mr. Cook's business, but many poultry secrets of value. Under these are the care of baby chicks, feeding ducklings, feeding baby turks, diseases of the poultry yard, and other points.

It is estimated that the Riverside district will produce the coming year about 4400 cars of oranges, the Redlands district 4300, with the Pomona and the Ontario-Cucamonga districts crowding for third place with about 2500 cars each.

The Fruit Growers Protective Association of Redlands proposes to operate at an expense of about fifty cents per acre per year and aid growers in the business management of marketing.

IN SWITZERLAND.

Edward Berwick of Pacific Grove, who is now traveling in Switzerland, sends the following chatty horticultural news from that section:

Almost all your readers have an interest in learning anything that bears on the European fruit market. For the benefit of those who have not visited Switzerland I am sending this line to comfort them in any feeling of deprivation they may have experienced. This has been with me a journey of surprises. I had pictured Switzerland as a land of snow and sunshine and dizzy, shaggy, craggy heights.

I've been in this place about 10 days and have hardly had a glimpse of either snow or sunshine. Morning after morning I have looked from my window on a sad-hued scene of a sheet of water almost hidden by a dirty drabby mist which has obscured sun and mountains and even the other shore of the lake half a mile distant. I have yearned for at least one day of Pacific Grove sunshine.

Yestermorn found me walking in the open-air market, held Tuesdays and Saturdays. Country folk bring in their produce and at impromptu stalls, formed of any rough and ready material, sell it direct to consumers. And here was another of my surprises. I had pictured this a land of grim gloomy pine forests whose "withered branches" and "awful avalanches" menaced the carrier of that "banner with the strange device, Excelsior."

I find it a land of fruit trees, pears, apples, walnuts, whose tops reach heavenward to Babel heights and whose age goes back towards Julius Caesar, whose fruit—well, about whose fruit perhaps the least said the better! Scrawny, scrubby, scabby, and any other adjective of a like character you can think of, Mr. Editor, you can apply; and the price for it in market is about as small as the fruit. It is roughly handled in great open wicker baskets that must hold near 200 lbs. each of the stuff. At the same time many fine looking pears ("Williams" called here, but our Bartletts) are seen carefully packed in excelsior and sold at 20c per lb. Italian prunes, various plums, and grapes are fair, but would make no showing alongside of our California output. The grapes are sometimes put up in neat wooden boxes with lace-paper lining and holding some 2½ lbs., retailing at 25c to 55c per box.

Chickens are cheap at 50 cents and up.

But they can beat us at parcels post. Any of these market products can be sent anywhere by mail at lowest rates. Tomorrow I am lighting out by way of Interlaken and Berne for Geneva, and have arranged to send our heavier baggage, two large expanding suit cases, by parcels post to the hotel at Geneva, where we intend to stay. They will each cost us about 30 cents, including their delivery at the hotel. How's that?

Among other experiences, I have been pleased to find the German railroads, government-owned, as cheap, and comfortable as any in the world. A well-cooked table d'hote dinner is served on the train for 72 cents. Even the second-class cars are sumptuously upholstered, and punctuality is the rule.

I rejoice to say that our trans-Atlantic passages are taken for dear old California by the "Berlin," a 20,000-ton steamship of the Nordeutscher Lloyd line, sailing Oct. 28 from Naples. Traveling thus far has deeply impressed us with the old story, "There's no place like home."—Edward Berwick.

Preparations for beekeeping may be divided into two parts. The first is the acquiring of a good general knowledge of the life and habits, the limitations and possibilities of the bee, also a general knowledge of the different ways of handling bees. He should also have a general knowledge of the peculiarities of the different races as well as the advantages and disdvantages attendant upon each race of bees. He should learn something of the different styles of hives and the different tools and fixtures in use.

Paso Robles is planning for farmers institute on the 19th.

FOR PROFIT PLANT

APPLES AND OLIVES

No two fruits have commanded wider attention during the past few years, which fact has led us to put in an unusually fine stock of trees, embracing all the standard commercial sorts, which we are offering at exceptionally low prices. 1,000,000 GRAPE VINES, Wine, Table and Raisin sorts. We do not grow Fads. Thoroughly tested varieties are our specialties. Let us figure with you. We have been pleasing our patrons for over 20 years. All stock grown on virgin soil, true to name and **FREE FROM DISEASE.**

Address **THE FRESNO NURSERY**
Box 615 M. FRESNO, CALIFORNIA. F. H. WILSON, Prop.

BUY SEEDS BY NAME

LILLY'S SEEDS

If you were buying apple trees you would rather pay a reasonable price for named varieties, guaranteed true to name by a nurseryman than to buy unnamed trees just because you could get them cheap. Did you ever think of the fact that this same argument applies to seeds? Branded and guaranteed seeds are the safest and in the end the cheapest. There must be quality in every package, for the maker must make good goods or he can't stay in business. When you buy Lilly's Best Seeds, Northern Grown, you buy seeds that are true to name, pure and of high germination.

Don't take chances. Send for catalog. **CHAS. H. LILLY CO., SEATTLE,** for over a decade the leading Seedsmen of the Northwest. No matter where you buy, ask and insist on Lilly's Seeds, and if your dealer does not sell them write to us and we will supply you. Lilly's "Crop" Book is of great interest to farmers. Free

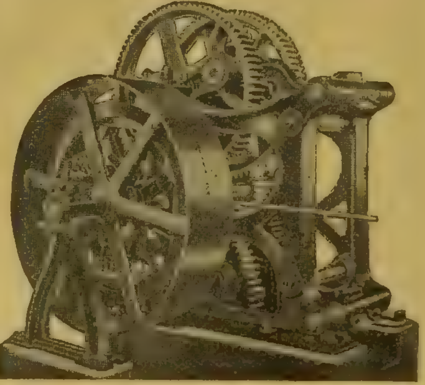
STRAWBERRY PLANTS

My plants are grown in Tropico and on land never before used for Strawberry Culture. Plants are selected by myself for breeding and the blossoms always picked, therefore the strength grows into new plants This is why my stock will produce by far the greatest amount of berries. If you are going to set out 100 or 500,000 be sure and write to

E. H. LEARNED ***R. F. D. No. 5, Los Angeles***

Grower of Strawberry Plants only, and only the best.

The Smooth Running Pomona Deep Well Pump



RELIABILITY.

Has passed through another most successful season's run, this being the fifth since starting.

There is no experiment in buying a POMONA PUMP. All the parts have been tried out and fully perfected. They will do the work, we know, and do it well.

We have records of plants that have made three seasons' run without one cent for repairs of any kind.

ECONOMY.

May be driven by a steam engine, gas engine or electric motor and in any case will give you the cheapest water and pay dividends on your stock.

Any Water Company going into the Irrigation business will run no chances in buying the POMONA PUMP. They are built heavy and strong. All the wearing parts are Bronze Bushed or Babbited and will last a life-time with the smallest outlay for repairs.

We can refer you to customers who are operating their POMONA PUMPS for less than one-half cent per inch per hour on 200 feet lift. This is less than half what their water costs with other pumps. The same make of engine being used in both cases.

GRAPE FRUIT (POMELO) ON TRIFOLIATA STOCK

Trifoliata stock has been received with caution in California and is now but little used. In certain soi's and ocations in Florida it has succeeded wonderfully. This illustration shows grapefruit trees as they were in May, 1910, six years after setting out.

In 1904 Mr. W. C. Temple set out at his Alabama Grove, at Winter Park, Fla., 150 grapefruit trees budded onto Trifoliata stock. In May, 1909, five years from the time these young trees were set out, an average of 4¼ boxes of grapefruit per tree was shipped from these trees, and the grapefruit averaged $7 per box for the entire crop, in Boston. Mr. Temple stands with hat in hand at extreme right. This engraving is used by courtesy of the Florida Fruit and Produce News.

PLANTING DECIDUOUS TREES IN ORCHARD

A Symposium of a Timely Topic.—Nurserymen of all Portions of the State Write Their Opinions on Best Methods of Work.

It is none too early to plan for the coming planting of deciduous trees. The first rains which are sufficient to wet the ground deeply should be the starting point of getting the land ready. Presumably before this time it has been graded evenly so as to permit of irrigation without excessive labor or loss of water. Also we assume the variety of trees to be planted has been definitely settled. In that case, this is a good season to talk with nurserymen and make contracts for January and February delivery. It is probable that better terms can be made than in the rush of the season and the certainty of having stock for the planting is well worth forethought. The indifferent results which have been secured by many planters ever since trees were planted call for greater care. Usually the nurseryman has been charged with delivering poor trees and it cannot be denied that this has sometimes been the case. In order to give the nurseryman a chance to speak to the prospective planter we have sent to many in this state a series of ten questions which are given below. The answers to these show how the nurserymen think their trees should be handled, and we believe will give a fund of valuable information to many. Of course all the answers are in the merest outline. The answers to Question Two, for instance, as one or two express it, would require a volume if given fully.

In regard to Question Four it will be noted that diverse answers are given. We heard this answered in a farmers institute by the statement that the hole for each tree should be as large as the entire orchard. This was an emphatic way of demanding the best of preparation of the soil. If with large plow and subsoiler the orchard has been put in excellent shape the holes may be smaller than in rocky or hard ground.

Question Five brings answers which show that all are not agreed in that particular. In fact, it is a question which the planter must answer for himself in considering his own soil.

Obedience to directions given in answers to Question Six is probably the hardest, and perhaps the principles there laid down are violated as often as any others given in the list of answers. But the answers themselves are better than any comment which could be made, and we give here the series of questions, afterwards the answers with only numbers prefixed.

1. How many months are included in the best planting period, i. e., how early may trees be taken from nursery in the fall and how late may they be planted?

2. Where is it best to plant them, i. e., can you give a general idea as to planting figs, apples, pears, cherries walnuts, peaches, and such other fruits? Of course if you covered all the fruits this would take too much time but whatever information you can give is greatly needed by tree planters. Orchard after orchard has been set only to prove a failure because owners did not understand this question.

3. What age and size of tree is best?

4. How large and how deep should holes be?

5. Is it best to plant any deeper in well prepared soil than tree was set in nursery?

6. Would you recommend close pruning of roots before planting or simply trimming mutilated ends? If you favor close trimming of roots, would you go to the extremes recommended in the Stringfellow method?

7. Would you top trees, i. e., take off greater portion of top grown in nursery, and if so, before or after setting? Would you do it by exact measurement the orchard over or according to vigor of trees?

8. If irrigation water is available, would you settle dirt about the trees with water or by tramping?

9. Would you advise use of fertilizer or manure, either in hole or on surface, at time of planting?

10. Is there any advantage in protecting trunks of newly-planted trees from rays of sun? If so, what method is best?

Chas. A. Chambers, Manager and Secretary, Fresno Nursery, Fresno.

My twenty years experience in all branches of the nursery business from the planting of seed, propagating, budding and grafting; planting, pruning and selling nursery stock has enabled me to answer your questions as follows:

1. The best time to plant deciduous fruit trees and grapevines and especially that class of stock which becomes dormant in the fall and winter, is in the months of January and February. These I consider the two best months to get the benefit of the winter rains. On account of the mildness of California winters, nursery-stock does not become dormant enough in the nursery to take up, much before December 15th. It is suicidal to take this class of stock out of the nursery row until the leaves have fallen and the stock has become thoroughly dormant. This class of stock can be planted as late as April 1st, however, January and February planting is preferable.

2. Great care should be exercised in planting the right thing on the right land. A great many failures have been experienced by planting a vineyard where a peach, fig, apricot, or some other tree orchard should be planted. Parties as a rule pay more attention to climatic conditions than they do to soil requirements. They labor under the general impression if the climate is suitable for growing a commodity the soil must be.

Then again the roots of a tree must be reckoned with. A great many planters pay no attention to the root a tree is grafted or budded on. For instance a peach grafted or budded on Myrobolan plum root will thrive and be profitable on heavy land—land that carries a great deal of moisture, while this root would be a dismal failure on light, sandy land devoid of natural moisture. Plum and pear root stock as a rule require heavy land which carries lots of moisture. The peach and apricot root do better on well drained soils. This is the case with all varieties of deciduous fruits; much depends on the character of root the tree is worked on when bought from the nurseryman. This accounts for the wonderful growth made by some orchards, while right adjoining in some instances, the same varieties which were budded on a different root seem to have a jaded look and are unprofitable. Cherries, walnuts, apples, and pears require plenty of moisture in the soil to perfect their fruits and make them a profitable investment. Light, well drained soils are better adapted for fig, peach, apricot and other commercial deciduous fruits. This is so when the trees (except the fig which is always on its own root) are worked on peach or apricot stock.

3. A healthy, well grown, yearling tree is the best to plant; yearling trees have a better root system than larger or older trees. A young tree can be shaped up better in pruning and given a better start and does not suffer the shock in transplanting experienced by overgrown older trees.

4. Much depends upon the variety of tree planted. The general run of deciduous trees require a hole about 16 inches deep and the same width. Walnut trees owing to their large, long tap roots may require a hole three to six feet in depth.

5. The best depth to plant a tree is about two inches deeper than it stood in nursery row. Do not cover the budded union where budded stock is planted, keep the bud union above ground.

6. Personally I do not believe in heavy pruning of roots; all defective or broken roots should be pruned off, allowing as much as possible of the original root system to remain. I do not favor the Stringfellow method as it has no particular merit and is too much of a shock. It is all right to shock the top heavily but as the top depends on the root system, it requires as much root energy as possible.

7. Trees should not be pruned nor topped until they are set in orchard form; as soon as they are planted, they can be pruned more intelligently and shaped up uniformly. This cannot be well determined until the tree is planted hence it is best to prune and top back after planting. If trees are of a uniform grade and size, the first year the trees can be topped uniformly; the following year they can be shaped up and pruned according to growth they have made.

8. Trees should be irrigated immediately upon planting. In planting, after the tree is set in the hole, fill the hole half way or half full around the roots. Use surface soil for this purpose, never use the same soil which was taken out of the hole originally. When hole is half filled with enough soil to keep tree rigid, fill it up with water. When the trees are all set and planted, retrace and finish filling the half filled holes; by this time the water has soaked in and around the tree establishing it. Watch the trees for several days after planting to see that there is not too much open space around the tree which allows air to find the root system. Tramp soil in and around the tree firmly until tree is established.

9. No fertilizer of any sort to be used on planting; use good surface soil and if you have none available on the spot haul some. When a tree is transplanted and given a new home, it is more or less weakened and fertilizers I consider too strong a medicine to give the patient. Get your trees established and later on you can provide a fertilizer in case the soil needs it. The average soils require a fertilizer more, after a tree commences to bear, unless of course one is trying to force growth in a soil lacking the proper ingredients necessary to promote growth.

10. All trees should be protected with a tree protector. This protects them from sunburn and also from rabbits, squirrels and other "varmints." The Yucca palm protector is the best and strongest to use. It is porous, allows a free circulation of air and at the same time affords protection.

E. S. Richman, Orange County Nursery and Land Co., Inc., Fullerton.

1. We consider that three months are included in the best planting season, viz., January, February and March. A fair degree of success may sometimes be attained by April planting but as a rule it is unsatisfactory.

(Continued on page 438.)

Stop *Bruising* Fruit and *Losing* Money.

Every time your clippers pierce an orange's skin you open the way to decay. Usually the cut is too small to *notice*—and the bruised one is crated with the good. *You* know that *one decaying orange may spoil an entire crate*—you lose just that much money. You *won't* bruise fruit if you use

WISS ORANGE CLIPPERS

United States Government Experts and leading citrus growers everywhere endorse Wiss Orange Clippers because they *know by experience* Wiss Clippers *last longest, do best work* and *save money* by *minimizing* the liability of bruising the fruit.

The blades are specially curved and ground—the points and outer edges are smoothened and rounded to avoid bruising. Handles are shaped to prevent tiring of the hand. Wiss Orange Clippers will give years of service — and are unrestrictedly guaranteed to give satisfaction. *For sale by all dealers.*

Wiss Solid Steel *Pruning Shears* will snip a broom handle and cut the most delicate tendrils. All parts are interchangeable and any broken parts can be readily replaced. 9-inch size, $2.25.

J. WISS & SONS CO., 15-33 Littleton Avenue, Newark, N. J.

The Troutman Orchard Heaters

Will Give You Absolute Protection From Frost.

Orchard heating eliminates the one great uncertainty in fruit growing, and is the greatest insurance agency on earth.

The Troutman Heaters are the WORLD'S STANDARD OF EFFICIENCY AND ECONOMY.

They are built on the scientific principle, and give more heat for the oil consumed than any other device.

They save 50 per cent of fuel and labor.

Special Prices Until November 15th.

W. H. FOWLER
415 East 2nd St. Los Angeles

The LaVerne Rotary Cultivator

The principle of Rotary Cultivation, is an entirely new one; the action of the teeth in the soil being different from solid, cut away Discs or ordinary Cultivators. It carries absolutely no soil with it and can be used at a greater depth with less draft than any other cultivator on the market today. The tool, works so close to the ground with no wheels or other attachments to catch limbs or tear off fruit, that it can be used to cultivate under the trees, where ordinary tools do not reach. The manner in which the teeth enter the soil, tends to keep them sharp and one set usually lasts a season.

We guarantee satisfaction in regard to work and quality of construction.

Citrus and Tropical Fruits

NOTES ON FUMIGATION.

By A. W. Morrill, Phoenix, Arizona.

The suggestions presented in this article mostly concern minor points of fumigation and are not new. As far as known to the writer, however, these points have not been brought to the attention of California citrus growers and fumigators, publicly at least. All of the points discussed are not even of interest to all fumigators, but it is the writer's hope that some will find the suggestions of some interest and perhaps value, and also will obtain from them a better understanding of certain principles of the fumigation process.

Method of Marking Tents.

The method of placing the numerals on the tents as previously recommended and generally practiced in California differs from the original design as used and recommended by the writer and his associates in Florida. According to the manner of marking common in California the numerals are frequently a foot or more from the graduated line, or stripe; according to the original design the numerals are as close as possible to the stripe. Numerals below 10 are placed close to the stripe or graduated line at the right between the graduation cross lines. Numerals 10 and above are divided, one figure on each side of the stripe. The graduation cross line to which the numeral belongs is the one which is below it. The writer considers the original design not only neater, but more convenient in practical use. This is better appreciated when one sees tents marked in the two styles and covering the trees.

Fig. 1

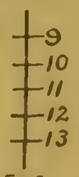

Fig. 2

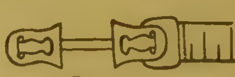

Fig. 3.

Fig. 1. Original design for making fumigation tents. Fig. 2. Design generally used in California. Fig. 3. "Washburn' clamp attached to end of tape for attaching tape to tent at any point. Original drawing for this article and used by mistake in former issue.

Measuring Circumference of the Tented Trees.

It has been my experience that pacing the distance around the tented tree was preferable to measuring with a tape. Concerning this point I have made the following statement in Bul. 76 of the Bureau of Entomology:

"One man can quickly obtain the circumference by using a tape provided at the end with means for attaching to the tent, while he walks once around the tree to the starting point, unreeling the tape as needed. For attaching the tape to the tent some form of metal clamp, such as is usually found in stock at gentlemen's furnishing stores, is suggested. In fumigating on a large scale the use of a tape causes considerable trouble, owing to unavoidable tangling and misplacing, especially when used at night. One of the operators, however, should always estimate the circumference of the tented tree by pacing. This can not be done with sufficient accuracy without considerable preliminary experience—obtained by measuring the first ten or fifteen trees covered, both with the tape and by pacing, and comparing the results. In pacing, the actual distance traveled will of course always be greater than the circumference as measured by the tape. With a little experience the proper allowance can be estimated with sufficient accuracy."

It has been my observation in Florida that men who are sufficiently careful to be suited to the responsibility of taking charge of a fumigating outfit can be depended on to pace sufficiently accurately for practical purposes. In hundreds of cases when measurements have been taken both by pacing and with the tape, they corresponded within one or two feet. However, if a tape can be handled as quickly, or more quickly, than the measurement can be estimated by pacing it is unquestionably safer and better to use the tape. The principal object of mentioning here the matter of measuring the circumference is to call attention to the inexpensive clamp or fastener which I had in mind in the reference quoted from Bul. 7. The clamp is one of the forms of the "Washburn" and consists of two clamps opening in opposite directions and connected by a straight rod. One clamp is attached to the end of the tape and it is thus provided with a permanent means for attachment to the tent at any point. The method now used by some fumigators in California of attaching the tape to a sharpened iron rod, which is pushed into the ground close to the tent may be considered by some fully as good as the one I have suggested, but it is probable that others would prefer to attach the tape directly to the tent by some such means as here described.

Measuring Water.

While I fully recognize the necessity of accuracy in every detail of fumigation, whereby greater efficiency is secured, and it is far from my purpose to advise any method of careless guesswork, the measurement of the water in a graduate for trees receiving more than five or six ounces of cyanide is advisable only when entirely convenient. In most cases it is convenient to measure in a graduate, but if anyone at any time finds the use of a long handled dipper holding fifteen or sixteen ounces more convenient, there is no reason why he should trouble himself about a graduate. The old method of measuring out the cyanide and acid at a commissary and later guessing at the amount of cyanide which has been weighed out for a particular tree, and basing the amount of water on this guess, is not a safe method. With the marked tent dosage system, however, knowing exactly the amount of cyanide which the tree is to receive, the proposition is different.

If, for example, the amount of cyanide is sixteen ounces, a fifteen ounce dipper filled three and one-fifth (estimated) times is exactly as good or better than exactly 48 ounces of water drawn off through a faucet into a glass graduate. The only precaution to observe is not to exceed the 48 ounces. If, however, a man is so careless as to measure three and one-third dipperfuls instead of three and one-fifth it will make a difference of less than one-half of one per cent in the amount of gas generated. If he carelessly measures three and one-half dipperfuls, the loss in gas amounts to less than eight-tenths of one per cent. In the first case the actual loss amounts to less than one-tenth of an ounce of cyanide; in the second case to a little more than one-tenth. It is impossible to calculate a dosage table so accurately that the loss of the gas from one-tenth ounce of cyanide would have any appreciable effect in reducing the efficiency against the insects.

If in measuring by means of a dipper if a fumigator is likely to make an error so great as to measure out one-half dipperful instead of one-fifth or less, as called for, such a person is too careless to trust in measuring acid and water even with the most accurate graduate. If the "error" consists in measuring out less than the amount of water required to make the correct proportion, there is a slightly greater amount of hydrocyanic acid gas generated. My own advice to one measuring with a dipper would be not to take the time or trouble to estimate the one-fifth dipperful in the example cited. Three dipperfuls or 45 ounces of water for the 16 ounces of acid will give practically the same result against the insects as would 48 ounces of water; theoretically a better result on account of the slightly greater amount of gas generated. An experienced fumigator can safely follow the plan, whether measuring with a graduate or a dipper, of considering as negligible odd ounces of water above two and one-half times and less than three times the amount of acid. By odd ounces I mean the difference between 48 and 51 if a 16 ounce graduate or dipper is used and the dosage table calls for 17 ounces of cyanide. It is a waste of effort for the sake of so-called "accuracy," with no gain, to bother with the three ounces of water more than the three graduate or dipperfuls.

Dosage Table Standards.

Dosage tables are only approximations at the best, but nevertheless it is necessary that they be based on experience and calculated as accurately as possible. As approximations they are none the less valuable since as long as there is leakage of gas and other factors to deal with it will be impossible to approach exactness as regards using the minimum amount of chemicals to acomplish the best possible results. All that should be expected of a dosage table is that it allow a fair margin above the minimum requirements throughout and at the same time no unnecessary wastes.

It is believed by some fumigators that a standard dosage table can be used as the basis for dosage with tents made of fabrics of different degrees of tightness to gas. If for instance a dosage table has been worked out as accurately as possible for tents made with the ordinary, loosely woven tent material the belief is that all that is necessary to adapt such a table to tents made of cloth of much tighter weave is to use one-half, two-thirds or three-fourths of the amounts called for in the original table according as a few experiments may show necessary. Such an idea is incorrect as can be readily shown.

If we begin with a table suitable for a tent of loosely woven fabric, we have one which allows for the leakage of gas according to the proportion of the cubic contents and surface of the tent. In general the smaller the tree the greater the rate of leakage to be provided for. In the case of a certain ratio (A) four-tenths or forty per cent of the total amount of gas generated is necessary on account of the leakage, with another ratio (B) onely one-tenth or ten per cent of the total is needed to make up for leakage. In ratio A the dosage amounts to 6 ounces; in ratio B it amounts to 30 ounces. By tests of a finely woven tent material on trees of about the size and form to give ratio A it is found that the dosage needed for a loose tent may be reduced one-sixth when this superior cloth is used. Shall we reduce the dosage throughout the table one-sixth, including those combinations of measurements giving us ratio B? In other words, in the first ratio we may prove by actual tests that a reduction of one-sixth, or five ounces, gives the same results with the tight tent as the original 6 ounces needed for the loose tent; now with ratio B shall we also reduce the dosage one-sixth giving us 25 ounces instead of 30? This is plainly incorrect since to do this would be to give in parts of the table a smaller dosage than would be needed for an absolutely air tight tent. It has been stated that in the example here considered the 30 ounces (ratio B) included only 10 per cent (3 ounces) to counteract the effect of leakage. Twenty-seven ounces would therefore be needed if the tent were absolutely gas tight.

More specific illustrations might be added, but the example given, based on figures found in a carefully worked out dosage table, shows that to use a given dosage table with tents of a comparatively poor quality and then to use a three-fourths dosage or a five-sixths dosage, as limited experiments may indicate necessary, may or may not give satisfactory results with tents of superior fabric. In any case there is a waste of cyanide which can be avoided only by working out an entirely new dosage table, allowing for a rate of leakage to suit the tightness of the tent.

Field Records of Fumigation Work.

The desirability of keeping a permanent record of fumigation work does not appear to have been brought to the attention of the California fumigators who have adopted the marked tent system of dosage. Mr. C. M. McFadden of Fullerton, and doubtless other fumigators have independently adopted the plan of record keeping, recognizing it as a check on errors. According to the work plan used and recommended in Florida by the writer and his former associates, the man in charge of the outfit takes the tent measurements, looks up the dosage on the dosage table and marks with a pencil on the grove diagram, in the proper space for each tree, the distances over and around and the amount of cyanide given. Grove diagrams are made out in blank form with the rows lettered in one direction and numbered in the other. It is best not to use the original complete diagram in the fields, but to use when at work a small diagram large enough to include all the trees which will be fumigated during the night. The small diagram may be filed away temporarily and copied onto the permanent record when convenient. Obvious errors in measurement or errors in looking up the dose on the dosage table may be discovered by means of records of this kind, which in many other ways prove of advantage.

(Continued from page 535.)

Most deciduous trees are ready to dig by the middle of December but some are not, for instance apple trees, and it is best to wait till after the holidays if a general variety is to be planted.

2. This would take a booklet to answer in full. The better the land the better the results. Walnuts specially need a deep rich soil to do their best. Apples and pears seem to thrive with moisture nearer the surface than such fruits as peaches, plums and cherries, which need a well drained soil without water near the surface.

3. For the most part strong one year trees are preferable, four feet and up in height and one-half inch and up in diameter. In the case of walnut trees larger sizes are mostly used, six feet up being mostly used.

4. Large enough to take the roots without cramping them. Eighteen inches in diameter and eighteen inches deep, or more if roots require it.

5. Two to three inches deeper in order to get the roots away from the surface.

6. With good healthy roots we trim only bruised and broken parts. Sometimes the roots get moldy from too much wet weather in winter where heeled in; in some cases trim roots and top more severely. Have never recommended Stringfellow's extreme method but have seen fine trees after that method.

7. With small trees up to three feet very little if any. No. 1 trees with good branched tops always trim back. Cut off about two-thirds of the top.

8. With good drainage we prefer to settle the dirt by irrigating.

9. Neither on good soil. With poor soil use on surface and let rains or irrigation water carry into the soil.

10. Lean trees a little to the southwest to shade the trunk and it will probably be all the protection necessary in the coast region. In interior sections perhaps Yucca or some light colored protector is necessary. Do not use tarred paper as it absorbs the heat.

Chas. H. Hamburg, Whittier Nursery, Whittier.

1. From the 1st of January till the middle of March is the best time to plant all deciduous trees in this section. For citrus trees from the middle of March till the 1st of July and at a time when they are dormant.

2. The best place for walnuts is several miles from the coast, like Whittier, portions of Santa Barbara county, Placentia, etc., where we get the ocean breeze but it does not get too cold in the winter nor hot in summer and on ground that is good, deep loamy soil, as a walnut is a deep rooter. Where grafted on the soft shell, root must not be too close to water. The damp ground will not affect the black root like the soft shell. Apples and pears do well on lower land or up in the mountain districts. Cherries do well in the mountains and in the northern part of the state. Peaches do well most any place in the interior country.

3. One-year-old bud on one and two-year-old root (a good, healthy tree is the best).

4. Two feet deep and two feet across except for walnuts, which should be deeper.

5. No, the trees should never be planted any deeper than they were originally in the nursery.

6. Trim the mutilated ends to healthy wood.

7. Yes, I would top the tree in proportion as the roots are cut, not by measurement, but according to the shape and vigor of the tree.

8. I would by all means prefer irrigating to settle the dirt around the roots if available, if not haul water, as nothing settles the dirt as well as water.

9. I would not advise using fertilizer or manure around a tree that is just being planted.

10. Yes, I think there is an advantage in protecting the trees from the sun, either by yucca method or paper.

S. W. Marshall Company, Fresno.

1. Early planting is best for deciduous stock, which usually becomes dormant and therefore ready to dig, about December 20th, depending of course on the season. From that time on, the earlier the better, although with care, planting may be done as late as the last of April.

2. This question is too large to answer as there are too many different combinations of soil and climate over the Pacific Coast, the only way to determine this, and it certainly should be done, is for the planter to obtain information in the vicinity of his planting.

3. For most deciduous stock a tree from three to six feet in height is best, a yearling tree, that is, a one year bud on a two year root.

4. The holes should be large enough to insure penetrating any hardpan or plowpan that will interfere with the roots going down.

5. Trees should be planted so that the place where the tree was budded is about on a level with the surface or not more than an inch below.

6. Deciduous trees should be topped as low as possible, where they have plenty of good live buds on the trunk they may be cut off to within twelve inches of the ground, after planting is best. This brings the fruit down where it may be picked with less expense, and affords shade for the trunk of the tree.

7. Would not advise too close pruning of roots, every bruised root should be cut off, every cut should be clean and with a sharp instrument.

8. Immediate settling with water is best.

9. If manure is used it must be well rotted and when used in the hole there should be plenty of soil between it and the roots.

10. The "Yucca palm fiber" tree protectors are the best as they are easily put on and will last a long time. Certainly would advise use of some protection.

W. V. Eberly, California Nursery Co., Niles.

1. December, January, February and March are the proper planting months. Of course, frequently a great deal of deciduous stuff can be planted in April but it is risky to wait so long. Trees cannot be taken from the nursery in the fall until the ground is thoroughly soaked and until they lose their leaves. It is seldom that we can do any digging before the middle of December.

2. Everything should be planted in good soil. Apples, pears, cherries and walnuts probably do best in

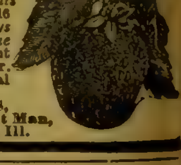
My Hardy Northern Grown **Strawberry Plants** are demanded all throughout California, because they have proved most profitable to California growers. Our natural strawberry climate and dormant season gives my plants unequaled vitality, energy and bearing qualities. One of many testimonials from large Southern growers—"*We have been buying plants from you for the past* 16 *or* 18 *years and have always found them pure and true to name.*" Shortest plant crop ever known this year. Write today. Special prices. Free catalog.



W. W. THOMAS,

EUCALYPTUS

Blue, Red, Gray, Manna, Desert, Swamp Gums and many others. Tough, hardy trees, selected rapid growers, thrifty and even in size, large or small as desired, for fall or winter planting. Guaranteed true to name and full count. Price right. Illustrated descriptive booklet and questions answered free on request. Write now.

LLOYD R. TAYLOR, Modesto, Cal.

deep, heavy soil where there is plenty of moisture and sufficient drainage. Stone fruits, like peaches, apricots and even prunes, will do fairly well on lighter soil. It is impossible for anyone to lay down any set rule, for soils are so different.

3. For large plantings probably one-year trees are to be preferred, although two-year trees of apples, pears, plums, cherries and prunes do very well. Almonds, apricots and peaches cannot be successfully handled when more than one year old.

4. Holes should be dug twice as large as the spread of the roots and twice as deep; then the top soil should be put back in the bottom of the hole to bring it up to the required depth before the tree is planted. All trees should be planted firmly, almost as firmly as you would put in a fence post. This to keep circulation of air from among the roots, etc.

5. In very light soils, where it will settle, it is well enough to plant the trees an inch deeper than they stood in the nursery; but if they are thoroughly planted and the soil is not very light they should stand no deeper when done planting than they stood in the nursery.

6. Roots should only be pruned where they are broken or mutilated. Of course, should there be a long root that runs way off to one side it is well enough to prune it back some. Stringfellow's method is wrong, at least from our standpoint and particularly for California conditions.

7. All transplanted trees should be cut back. It is best to do it after they are set out probably, as one can then get them all the same height. There is a great diversity of opinion as to how far to cut them back; some planters cut back to eight inches above the ground after planting. We think 15 to 18 inches is better on most things.

8. If water is available a good plan is to fill the holes half full of dirt and then settle with water, filling in the remainder of dirt after water disappears and tramping well.

9. Use no fertilizer of any kind among the roots; if you do you will kill the trees. It will do no harm if put on top of the ground after the trees are planted.

10. The trunks of all trees planted in California should be protected the first year. Yucca tree protectors serve a very good purpose. A shake or a board firmly stuck in the ground on the sunny side answers a good purpose. Burlap wrapped loosely around also serves. If none of these methods can be employed a heavy coat of whitewash helps.

Leonard Coates' Nursery Co., Morganhill.

1. Four; December to March, inclusive. Let the rule always be, however, to plant deciduous trees as early in the winter as possible, relying upon the condition of the soil rather than upon the month or day of the month.

2. (a) Figs for commercial purposes shoould be planted in the Sacramento-San Joaquin Valley, although anywhere in the state the fruit may be grown successfully to supply the needs of the family.

(b) Apples in the Watsonville district and along the coast northward, and also in the foothills of the Sierra Nevada mountains as well as in the Coast Range from Monterey north.

(c) Pears, almost anywhere, provided soil is right; the area for both apple and pear covers almost the whole of central and northern California.

(d) Cherries: Solano, Sonoma, Napa, Santa Clara counties; also Sacramento Valley along river bottoms, and in foothills about Newcastle, etc.

(e) Walnuts: South, in Los Angeles, Santa Barbara, Ventura and Orange counties, and also in all coast counties north of Monterey, and in portions of Sacramento Valley north of Davis, as well as about Stockton and Sacramento.

(f) Peaches: San Joaquin and Sacramento Valleys, mainly; also in all coast counties from Napa to San Benito.

(g) Apricots are grown successfully in a more limited area: Santa Clara and Solano counties, parts of Sacramento and San Joaquin Valleys and isolated spots. Also in the south in Ventura and other sections. These remarks apply mainly to California north of Tehachapi, although deciduous fruits, with the exception of cherries, are grown to some extent commercially in many parts of Southern California.

3. One year from bud or graft for deciduous trees. A tree about four feet in height and half an inch in diameter is considered by practical planters of experience to be better than larger stock. Walnut trees of larger size, and on older roots, generally succeed better than smaller trees.

4. The only rule is to make the hole large enough to allow of spread of all the roots in a natural position. This would mean not less than two feet wide by one and one-half feet deep.

5. About the same depth as in nursery or a little deeper.

6. Top the trees according to their size; taking two feet as a good average length for a topped tree, after setting. Cut it so that it will be pruned to a good bud, or where there are several good buds. A tree often fails to start because all the strong buds have been lost by cutting the top too low down. Especially is this the case with large, irrigated trees, the good buds often being four or five feet from the bottom.

7. Simply trim mutilated ends.

8. A judicious "firming" of the soil after planting is always advisable, but loose earth must be left at surface. Water and tramping do not well go together.

9. No; fertilize when orchard is bearing.

10. Great advantage; the heat of the sun on young, newly transplanted trees is the source of many ills. Any shading that will admit air, and that will reach high enough to protect the bark at first forking of limbs will meet the requirements.

E. Wightman, Chico Nursery Co., Chico.

In answering some of the questions, we have answered them from the standpoint of this section of the state.

1. Best planting time in this section is from early December till latter part of February. Trees may be taken from the nursery row about December 1st until the latter part of February.

3. One year old 4 or 5 foot trees.

4. Holes should not be dug much larger or deeper than will serve to

TREES WE INVITE YOUR ATTENTION

To our magnificent stock of **Fruit Trees, Grape Vines, Ornamental Stock and Roses** now ready for delivery during the season of 1910-'11.

More especially would we emphasize our offering in

Walnut Trees

Never before have we had such a fine block of GRAFTED WALNUTS to offer, including the renowned French types, FRANQUETTE, MAYETTE, PARISIENNE, CHABERTE, also THE PLACENTIA PERFECTION. These trees are stocky, vigorous and well grown. Anyone contemplating the planting of walnuts this season should communicate with us now, for we are prepared to furnish trees of first quality and our prices are right.

Fruit ROEDING TRUE TREES FRESNO, CAL. **Trees**

Varieties suitable for planting in the interior valleys, the Coast counties, and the foothill regions.

Apples: All the leading summer, fall and winter types.

Peaches: Clings and Freestones, for canning, drying and shipping.

Pears: Bartlett and other leading varieties.

Plums and Prunes for shipping and drying.

Burbank's new "Standard" Prune

We desire to lay special emphasis on this new Prune, which is a cross between the Tragedy and Sugar Prunes. It has been tried in a commercial way for several years, and its possibilities as a high-grade prune have been established beyond a question of a doubt. Mr. Burbank recommends this tree as an enormous and never failing bearer, and strong, healthy grower. Well grown fruits measure 4½ inches round one way by nearly 6 inches the long way. Skin dark reddish purple, with blue bloom; flesh honey-yellow, fine grained, juicy, yet firmer than most other drying prunes. Is very sweet and a perfect freestone. Best combination drying and shipping prune ever grown.

EVERY PRUNE GROWER SHOULD REALIZE THE VALUE OF THIS VARIETY AND INCLUDE IT IN HIS ORDER. We are offering trees of this grand variety, also grafting wood.

Wish also to recommend the Burbank plums, Gaviota, Formosa, Santa Rosa, all excellent table and shipping sorts.

Fig Trees, Olives, Oranges and Lemons

CALIMYRNA FIGS, THE GENUINE SMYRNA FIG OF COMMERCE, AND THE ONLY VARIETY TO PLANT FOR COMMERCIAL PURPOSES. ALSO THE ADRIATIC VARIETIES OF FIGS.

OLIVES ARE BRINGING THE PRODUCERS IMMENSE RETURNS, AND ANYONE CONTEMPLATING PLANTING THIS YEAR, SHOULD WRITE EARLY TO HAVE STOCK RESERVED.

CITRUS TREES. ABSOLUTELY FIRST-CLASS IN ALL RESPECTS. WE ARE PREPARED TO FIGURE ON TREES IN LARGE OR SMALL QUANTITIES.

"California Horticulture"

The Fruit Growers' Guide. Aside from describing 2000 varieties of trees and plants, contains practical instructions for planting and care of stock, also pruning and cultivating. Price 25c postpaid.

"New Products of the Trees." Describes Burbank's plums and rapid growing timber walnuts. 25c postpaid.

New Illustrated Price Catalogue

On November 15th we expect to issue this new booklet, which will contain brief descriptions of all the stock carried by us; also profuse illustrations, as well as prices. Copy will be mailed free on application, by referring to this ad.

Box 12, Fresno, Cal.

set the tree in and straighten the roots out.

5. Plant the tree in the orchard about the same depth as it was in the nursery.

6. Trim off the ends of the roots with a sharp knife, making a smooth cut. Do not favor too close pruning.

7. Top of trees should be taken off about the height you wish the head to form, 18 to 24 inches inches from the ground. Some planters go over the field after planting and cut off the trees with a sharp knife, even with the knee. Should all be about the same height.

8. Use water where available.

9. No fertilizers or manure in the hole or surface around the tree. It tends to dry out the ground, is also liable to burn the tree.

10. Trunks of the tree should have protection by wrapping. Tree protectors save sun-scald, sun borers and protect the tree from barking by accident. There is a commercial tree protector made of Yucca fiber, that has given universal satisfaction.

John Vallance, Nursery Department of C. C. Morse & Co., San Francisco.

We are glad to know that you have taken this matter up as we consider it a very important one. So many people dislike to cut a tree back; they think they are losing so much growth. This is, of course, an erroneous idea and the sooner it can be corrected, the better it will be for the nurserymen. Trees left in such condition never prove satisfactory and consequently, the nurseryman is blamed for it.

1. January and February.

2. Figs should be set out in the warmer sections, principally the San Joaquin Valley, and the other fruits mentioned can be planted from Mendocino to San Diego. The intending planter, however, must use his own judgment about the best locations for each of these fruits.

3. The best tree to plant out is what nurserymen call "one year old" trees; the root is a year older so this practically makes the tree two years old, but nurserymen style them "one year old"; either 3 to 4 feet high or 4 to 6 feet high—4 to 6 feet preferable.

4. In sedimentary land, the hole does not require to be so very large, 1½ feet square will cover it. In heavier soil, 2 feet will be necessary.

5. Plant a little deeper than they were in the nursery row.

6. We recommend "medium" cutting back of the roots. We would not go to the extreme as Mr. Stringfellow does, although we practice it a great deal in our nurseries when we are lining out young stock, and have had good success with it.

7. Trees should be pruned after planting, not before. They should be cut back about the same height as near as possible. For instance, if you are planting one year old French prunes, they make a straight growth and run 5 to 7 feet high. These trees can all be cut back uniformly, about 3½ feet. This is governed a good deal by the location. In the warmer sections low heading is pursued and in colder sections the trees are not cut back so much.

8. In the drier sections it is a good idea to use irrigation to settle the soil around the roots after planting, but in the northern parts and in the Santa Clara Valley, where the rain fall is good during the months of January and February, this is not necessary.

9. In planting large orchards fertilizing is never pursued.

10. It is very necessary to protect the trunks of young trees during the first summer months, either by tule tree protectors, shakes set on the sunny side, or by wrapping newspaper and tying with a cord. This keeps the tree from getting sunburnt and is certainly of great benefit to the young tree.

Geo. C. Roeding, Manager Fancher Creek Nurseries, Fresno.

1. In California the best time for planting deciduous trees is from the first of January to the middle of March. People often desire to plant trees in the fall of the year, being under the impression that by doing this the trees will be benefited by the rains of the entire season. Most people making this mistake are led to do so by their experience in planting in the East and Middle West. Conditions are entirely different in California, where trees often grow in nursery rows as late as the first week in December, and if they are taken up too early, before they are entirely dormant, the roots will turn black in many cases and the trees will not grow.

2. Figs may be grown throughout the entire state of California for table purposes excepting in localities where the temperature during the winter months goes as low as 18 degrees Fahrenheit below zero. For drying purposes the Sacramento and San Joaquin Valleys are both very desirable sections for growing figs on a commercial scale, and the same may be said of many points in the southern part of the state forty miles from the coast.

The largest commercial apple section in the state is in the country surrounding Watsonville, from which point about 4000 carloads are exported annually. The conditions around Watsonville are particularly favorable for apple growing on account of the exceptionally fine soil which is very retentive of moisture, and also because of the cool summers which allow the fruit to mature at the time it is in greatest demand for shipment, not only to all parts of California, but also to Europe and many of the Middle and Eastern states. There are many other counties in the state adapted to growing apples, particularly those aligning the coast from San Francisco north. Very few of these sections have been exploited to any great extent, but there is no question that they possess advantages which make them exceedingly favorable for the growing of apples. The fact of the matter is that apples may be grown commercially in the Sierra Nevada mountains at elevations of from 4000 to 6000 feet. The only difficulty with the development of the industry in the mountainous sections of the state has been the matter of transportation. The interest which has been manifested in apple growing in many of the higher elevations in the southern part of the state is indicative of what may be expected there as well as elsewhere at the elevations named as soon as proper transpor-

tation facilites are arranged for.

Pears until recent years have been grown very largely in the San Joaquin Valley. The blight, however, has practically killed the industry. At the present time they are grown quite extensively in the Santa Clara Valley and other sections aligning the coast, and plantings are still being made, and thus far no inroads have been made by the blight. It is probable that this has been due to climatic conditions being unfavorable for the rapid spread of this fungous disease which was so virulent in the interior valleys of the state. The high prices which pears are bringing annually for shipments to the East are sufficient indication of how the Bartlett pear is appreciated there. This pear is particularly well adapted for canning purposes and prices are bing paid for green pears which will justify growers in planting more, providing they have some assurance that the blight will not kill the trees. In some sections where the blight has been introduced, growers who have been careful in their methods of cutting it out have succeeded in holding it in check and in producing good crops.

The great walnut section of the state has been Southern California. Most of the trees have been of the Santa Barbara variety and planted as seedlings. In recent years a new variety, a great improvement over the Santa Barbara, has been introduced and named Placentia Perfection. The high prices for which walnuts have sold have resulted in orchardists in other sections of the state investigating the possibilities of their properties for walnut growing. The fact that the French types of walnuts like the Franquette, Mayette, Chaberte, and Parisienne are late bloomers has made it possible to grow walnuts throughout the northern counties of the state and particularly in those which receive the benefit of the trade winds from the ocean in the afternoon. Walnuts are successfully grown also in the interior valleys, particularly on the river bottom lands where the soil is of a silty nature which readily retains the moisture when thoroughly cultivated after irrigation.

There is hardly a section in the state which will not grow peaches. Most of the large commercial orchards, however, are located in the Sacramento and San Joaquin Valleys where conditions are very favorable, both for drying and producing large sized fruit of the cling varieties for canning purposes.

3. As a general rule all the varieties of deciduous trees which have been planted in California are yearlings, the only exceptions being walnuts and figs..

4 and 5. For the general run of fruit trees the holes should never be dug less than 18 inches in diameter and 18 inches deep. For walnuts the holes should not be less than two feet in diameter and from two and a half to three feet deep. There is no particular objection to planting trees somewhat deeper than they were set in nursery rows. Many growers, however, make the mistake of planting their trees even six inches deeper, and when this occurs, in many cases trees will die, or if they do not die their growth will be seriously retarded for several years.

6. It is always advisable to prune the roots of trees, and by all means remove mutilated ends. I certainly would not recommend a grower in California to adopt the Stringfellow method. This may be satisfactory in localities where there is a great deal of rainfall, but in my opinion no grower would be justified in following out this radical idea in California.

7. The proper time to cut trees back is after they have been set out in the orchard. It is a very simple matter to do this. A good rule to go by is to cut trees off at about the height of one's knees from the ground. This does not, however, apply to walnuts which many state should not be cut back. In my opinion, this is a mistake and far better results are obtained if the walnut trees are cut back to about four feet from the ground after they are set out.

8. One of the greatest difficulties in setting out orchards and the one reason above all others why they fail to grow, is because so many people will not settle the dirt around the trees with water after they have been planted. In some cases where irrigation water is available but not at the time the trees are set out, people will wait a month or so until water is turned into the ditches. In other cases the soil is not properly tramped around the trees, through the carelessness of workmen, the roots dry up and the trees die. Under no consideration should an orchardist allow more than two weeks to elapse after planting trees before settling them either by irrigation or by carrying water to them in buckets. Not less than fifteen gallons of water should be used in settling the dirt about each tree.

9. It is not really necessary to fertilize the trees just at the time of planting. It is certainly not a good plan to put fertilizer in the holes, for the young rootlets coming into contact with it are burned to such an extent that the trees in many cases will die. It will never do any harm to use well rotted stable manure on top of the ground and work it into the soil. By following this latter plan the rootlets take up the fertilizer as they require it.

10. By all means protect the trees if you wish to prevent them from being sunburned. These tree protectors not only keep the tree in a vigorous growing condition, but also prevent in many cases the introduction of the flat-headed tree borer which is the cause of so many deciduous trees dying annually in California. Ordinary paper wrapped around the trees will prevent them from sunburning. Tule is also an excellent protector, but probably the most practical one of all is that made of yucca fiber.

J. E. Bergtholdt, Secretary and Manager the Silva-Bergtholdt Company, Newcastle.

1. Trees should not be dug until they are entirely dormant, which in the nurseries of California will average from December 1st to 15th, though some nurserymen will dig before trees are dormant in order to effect early deliveries and strip the leaves, but this is very injurious to the trees. The best months for planting are January and February, though trees can be successfully planted from March 1st up to April 15th in California, where they are very carefully handled and irrigated.

2. Your question is a very broad one and one wherein a great many growers have gone wrong. There are never a great many varieties of fruit

that one can specialize in, in any one locality and do so successfully and profitably. Where we are not familiar with the conditions in the vicinity where an inquirer contemplates planting we usually advise the inquirers to ascertain from successful fruit growers in their districts as to what varieties are most profitable and take advantage of the experience of others and avoid their mistakes. California, unlike any other state, has a very great variety of conditions of soil and climate, in all of which horticulture wants to be carried on differently to harmonize with the bearing conditions. We could not give you an intelligent synopsis as to the best varieties to plant in the various fruit growing districts of the state without entering into the matter at too great length, but in the information you aim to give growers would admonish them particularly to be careful in this regard and profit by the experience of fruit growers in their district. Many Easterners will come to California and plant an orchard the same as they would plant it in the state of New York or Ohio, or some other locality, and do so to their loss.

3. We recommend the planting of one-year-old deciduous fruit trees only. In olives and oranges an exception can be taken to this.

4. Holes should not be smaller than an 18-inch cube, the larger the better.

5. It is not advisable to plant trees deeper than they were in the nursery.

6. We would recommend the pruning of roots before planting and also the trimming of mutilated ends, though we do not advise close pruning. A good root system should have from two to four main branches each, with several laterals.

7. In the majority of instances we would recommend the topping of trees at the time of planting to knee high, though this may be slightly varied in some instances.

8. We would prefer settling dirt by tramping, though where there is a lot of moisture in the soil at the time of planting it is advisable after planting to give the trees a moderate irrigation. Thorough cultivation is preferable to heavy irrigation.

9. The question of fertilizer would depend upon the condition of soil at the time of planting. The soil being replanted to trees, it is well to fertilize with barnyard manure on the surface and turn under.

10. It is always advisable to protect trunks of newly planted trees from sunburn, that being an effective preventive of borers; being also a protection from rabbits, bruising, etc. We prefer to use three shakes as it allows of circulation of air and some morning and late evening sun, which is conducive to a more normal development of the bark than is afforded by a close wrapper.

Almon Wheeler, Ruehl-Wheeler Nursery, San Jose.

1. Generally speaking, last half of December, all of January and February is the best time, but good results are obtained from March and even April plantings. Depends on the rainfall in early fall and late spring.

2. As to where to plant, commercially considered, the planter, if not experienced, should consult authorities in the neighborhood of his intended planting. Figs seem to thrive in any decent kind of ground, but require hot weather to mature a good crop before frosts and rain. Apples and pears in strong and moist soils. Cherries, walnuts and apricots in deep well drained and loamy soils. Peaches thrive better on the same treatment but are not so particular.

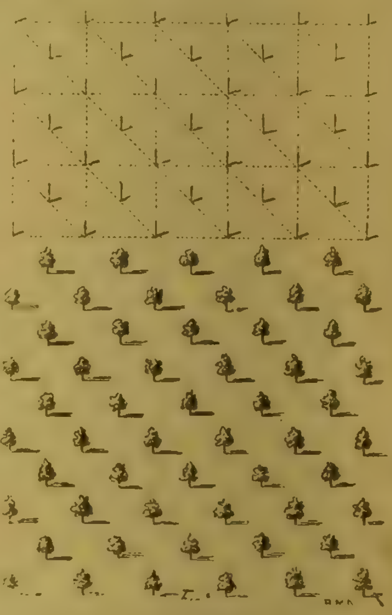
3. Age is a matter of choice, but peaches and apricots generally grow too large for planting two years old.

4. Depends on the kind of root, but no mistake can be made in making the hole larger than absolutely necessary, say two feet wide and 1½ to two feet deep.

5. In light soils a little deeper than in the nursery, but in heavier about the same.

6. Simply trim the mutilated roots, but that is a matter of opinion.

7. Yes, would take off the greater portion of top grown in the nursery, amount cut depending on kind of tree. Would do it by exact measurement if trees were of equal vigor, otherwise the weaker trees need the more cutting. Always trim after planting for obvious reasons.



TRIANGULAR-ALTERNATE SYSTEM.

8. Nothing to equal water to settle the soil about the roots, if used properly.

9. If soil requires it, use fertilizers, but you cannot be too careful in placing it about the roots, the safer way being to use as a mulch, or scatter on surface, then cultivate in if a commercial fertilizer.

10. Whitewash, a shake, or any protection allowing a free circulation of air about the trunk.

W. H. Gilstrap, Gridley Colony Nursery, Gridley.

1. Trees should not be taken from the nursery for planting prior to becoming dormant in the late fall, and may be planted thereafter any time prior to starting of sap, or growing season the next spring; but, we deem the best planting season to be during the month of February, or, fore part of March. If ground is not too wet, early planting is preferable, as it insures thorough settling of dirt around roots by the rains. Would not recommend fall planting, as the soil can not be put in as good condition after planting as prior to that time. If trees are planted after the main rains, dirt should be settled around the roots by applying sufficient water after roots are covered with dirt. The filling of the hole in which the dirt has been settled, as above indicated, should be completed with loose dirt, to prevent baking and evaporation of the moisture. Water can be applied

by hauling in tank or barrel, as a bucket full to the tree, under ordinary conditions, is ample. The land should be plowed thoroughly and deep in the fall prior to planting, and again just prior to setting out the trees. Land thus cultivated will hold the moisture better the coming season, and be much more easily kept in good state of cultivation. I consider the above advice applicable to the planting of all varieties of fruit mentioned.

3. A tree one year old from the bud, and medium size, is preferable. Under no circumstance would we recommend planting a small, or stunted tree, neither would we plant an extra large, or two year old peach tree.

4 and 5. Would recommend digging the hole much larger and deeper than would be necessary to admit the roots of the tree planted. After digging the hole, refill it with mellow, or pulverized soil sufficiently to permit planting the tree from one or two inches deeper than it grew in the nursery.

6. We recommend medium close pruning of roots prior to planting, but would avoid extremes. It is important to examine the roots closely and destroy any tree having root-knot, or other root disease.

7. Would prune all trees after planting, from twelve to sixteen inches from the ground, leaving no long limbs. Would leave a short "spur" wherever I desired a limb to grow, permanently. These limbs are frequently pruned closely in nursery, which we consider a detriment to the tree. Would keep within the limit above indicated, but vary according to the condition of the tree, and desire regarding its future shape.

8. Would certainly settle dirt around roots with water if tree is planted after all the heavy rains for the season have likely occurred. If planted prior to that time, tramping the dirt around the roots, lightly, but not in such manner as to pack it, if wet, would be sufficient. The question of having water at that time for irrigation should not govern in this matter, as it can be hauled in tank or barrels, as above indicated, at a comparatively small expense.

9. Would not advise use of manure in hole where tree is planted, but a liberal application of it to the surface is very beneficial. This is especially so in heavy, clay soil, that has been farmed to grain without fertilization for a long time.

10. We consider there is some advantage in protecting the trunk of the tree from the sun the first season, but, if properly pruned and cared for, the leaves will afford ample protection.

In this locality, failure to secure satisfactory result from planting orchards is usually due to one or more of the following named reasons: late planting; failure to properly prepare the soil prior to planting; failure to properly settle dirt around roots when planting; too much irrigation and insufficient cultivation; careless cultivation, "barking" the trees; planting unreliable, "cheap" trees; failure to properly spray the peach trees at the right time; improper, or "high" pruning. There are many who do not prune trees sufficiently close, but few, if any who prune too closely, either the first year or thereafter.

D. D. Campin, Smyrna Park Nurseries, Ceres, Stanislaus Co.

1. January and February possibly the first part of March. In taking up trees, especially deciduous in California, the first of December. Some plant up to April. Would not want to plant later than March 15th.

2. Pick out the best soil one has. As to the planting of different trees put figs 30 feet apart, apples and cherries 25 feet, pears 25 feet, walnuts 30 feet, peaches 20 feet

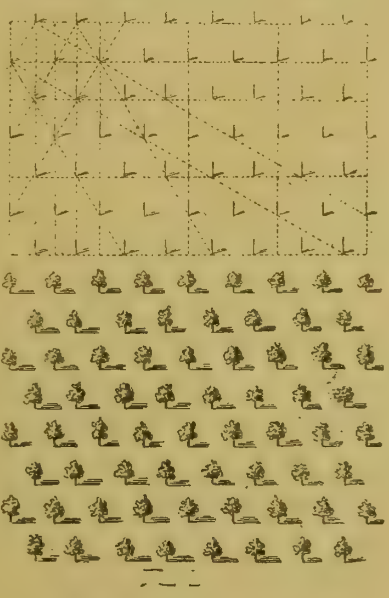
3. Two year root and one year top, 3 to 4 and 4 to 6 feet.

4. Two by two feet.

5. Trees should be planted up to where they were budded, will probably be about one to two inches deeper than in the nursery.

6. Trim all mutiliated roots and ends. Cut all ends fresh on lower side so they will be sure to come in contact with the ground. If roots are too long, cut them back to six or ten inches, although we have had some very good results where we trimmed off everything, but the straight tap root on peaches. Where we did that we also cut the top back to within two inches of bud.

7. Would top all trees. On 4 to 6 feet trees would cut them down to about 20 to 24 inches, according to the tree. Would leave trees until after planting to do the final trimming. Would try and get all trees to head as near the same height as possible, but wouldn't go to extremes.



THE HEXAGONAL OR SEPTUPLE SYSTEM

8. Would tramp all trees same but would always irrigate just after if possible, or wet them with a bucket of water.

9. We had some trees we planted in our orchard this last year on ground that was scraped heavily which were not growing to suit. We put some tree fertilizer, about a pound, around each tree and they made a good growth after being irrigated. Would never put manure in the hole when planting. Put around the top and cultivate in.

10. Would always protect trees. The Yucca tree protector is the best, but cloth or burlap is all right.

Fearing Arizona farmers may be charged with telling "fish stories," a subscriber at Yuma writes, in confirmation of productions of alfalfa seed, that "Mr. Carroll Power three miles below Yuma has produced this season 735 pounds per acre from his ten acre field. In addition, from the ten he has baled 24½ tons of straw." The seed has been sold for fifteen cents per pound and the straw at $8.00 per ton. In addition the field will give three cuttings of alfalfa hay.

Over two-thirds of the grain of Walla Walla Valley in Washington is still in the hands of the farmers.

Laying Hens, Pullets, Cocks, Cockerels, Etc.

700 to 1000 on hand daily. Right now is the time to get the best birds at the lowest prices as we wish to close out a few hundred before the fall rains come.

Write us for prices, STATING EXACTLY what BREEDS you are interested in and how many you need, and we will make you the lowest possible price. We ship everywhere and mail free a 32-page catalog and price list to all who ask for it.

Our prices are changing and will have to be made in writing on anything you wish in grown chickens. We are hatching and shipping many kinds of BABY CHICKS every week at present. Write today and tell us your wants. Largest Baby Chick Dealers in the World; largest fancy poultry yards in Los Angeles.

THE NEW IDEA

Just the thing that every farmer and orchardist has been looking for for years—a real Manure Spreader—not simply an unloader. That is why the

New Idea Spreader

takes the lead.

Why? Because:

It will absolutely pulverize hard substances better. Gives wider and evener spreading of any class of fertilizer. Less weight. Lighter draft. Absolutely gearless, no cogs or bevel gears. Its simplicity insures less breakage. Low down and easy to load. Only perfect endless conveyor that cannot race or slip, and needs no cranking back for re-loading. Better construction and longer life. Strongest wheels, both front and rear tracking with standard wagons. Load evenly carried on both axles. Double cylinders with Pointed Teeth, preventing choking and bunching, and the Widest Range of Feed.

Our new contract with the factory now enables us to make a GREATLY REDUCED price on this POPULAR SPREADER.

Illustrated and descriptive catalog on request. Demonstrations to responsible parties.

DE LAVAL BUTTER

Triumphs As Usual
At National Dairy Show

At the fifth great NATIONAL DAIRY SHOW held at the Coliseum in Chicago October 20th-29th, butter produced through the use of DE LAVAL Cream Separators made the usual clean sweep of all the higher awards, just as at all previous National Dairy Shows as well as all the contests of the National Buttermakers Association since its organization in 1892.

The highest award at the great Dairy Show this year went to Albert Camp, of Owatonna, Minn., with a score of 97, and the second highest award to B. A. Hass, of McFarland, Wisc., with a score of 96.66, both DE LAVAL users.

In the seven great State Contests for Silver Cups, five of the Cup winners were DE LAVAL users and one was an exhibit made from cream gathered from farm separators largely DE LAVAL.

Year after year, dating back to the invention of the "ALPHA-DISC" system of DE LAVAL bowl construction, butter made by users of DE LAVAL machines has scored highest and won all highest awards at every large and thoroughly representative butter contest throughout the world.

The explanation is to be found in the ideal design and construction of the DE LAVAL separating bowls and their comparatively low necessary speed, which enables the production of cream of even texture in perfect condition for superior buttermaking, an advantage which is never possible in the use of any gravity creaming system and seldom in that of any other centrifugal separator.

Hence the indisputable fact, established by twenty years of world's records, that DE LAVAL Cream Separators produce not only the MOST but the BEST cream and butter.

SOME DAIRY OBSERVATIONS OF A TENDERFOOT.

By E. E. Kaufman, Kerman.

Having been particularly interested in dairy husbandry for a number of years before coming to California I made it my first point of inquiry in a somewhat hasty study of the agricultural conditions in this part of the state. About the first observation made was the high price the Californian had to pay for a good article of milk and butter. Why was it that with such good cows and such good feed all the year round there was not enough butter to go around at a lower price? A little inquiry and reading soon developed the fact that the butter eaters were increasing faster then the butter producers, and notwithstanding the great inducements to milk cows the state was importing two million dollars worth of dairy products every year. The great distance such products must be transported has the effect of so increasing the price that the dairyman of California has a more effective system of protection than could possibly be devised by congress if in continuous session for a dozen years.

Then there is the immense variety of products that can be grown in a state like California. In the Dakotas we raised wheat, corn, oats, barley, flax, horses, cows, sheep, a few hogs of different kinds and some butter. In California all the above are grown to a greater or less extent, while out here there are so many people engaged in lines of farming like raisin' raisins, peaches, oranges and all the various kinds of fruits; to say nothing of the vast number interested in raisin' the price of land, that really only a few are left to raise butter, and the only wonder is that we all do not have to eat oleomargarine on our biscuits and raisin bread.

One observation I was pleased to make was the great preponderance of strictly dairy breeds in the cows used for the dairy. Instead of a herd of ringed, streaked, striped and grizzled cows, one sees black and whites and the black and squirrel grey of the Jerseys largely represented. This is well and shows fully as much gumption as engaging in the business of dairying in the first place.

The great advantage of feed for the dairy herd under California conditions was another observation. Alfalfa in front of you; alfalfa behind you; alfalfa to the right of you; alfalfa to the left of you; the grandest feed ever devised for the production of milk and butter. Then it could be served in such a variety of ways; green, plucked in its infancy by the old cow herself; or allowed to blossom and carried to her by the dairyman; hay, loose, baled or ground in 57 varieties all pure, unadulterated and guaranteed under the food and drug act of June, 1906.

The soil producing alfalfa is fully as important as the alfalfa itself when it comes to the proposition of dairying. Not only must the soil be of the right kind to produce alfalfa abundantly, but it must be of such a nature that it can be pastured freely without injury to the growing plants or punching it full of holes during a wet time. That means the soil must be a sandy loam, easily worked and not subject to baking during hot weather.

With such a soil and a sure water supply for irrigating, green pasture is assured practically the year round, while with a soil of an adobe nature there is no pasture on account of injury to both soil and growing alfalfa. It would seem that this district is particularly well favored in this respect for absolutely no soiling is required here unless you prefer to handle your farm in that way, considered by many the most profitable.

Climatic conditions as affecting dairying should not by any means be omitted from the observations of even a tenderfoot, as they are of considerable moment in the production of milk and butter; to say nothing of their importance in the production of feed and the environment of the dairy herd. A hot dry climate the greater part of the year and an all-the-year-round outdoor life for the cow is sure death to the tuberculosis bug, hence the California dairy cow bred and brought to maturity in the San Joaquin Valley should be, and my observation is, as free from this dread disease as anywhere in the whole country, and with reasonable care there is no danger from the use of her milk in the most liberal manner. A hot dry climate with plenty of sunshine is also hard on the bacteria whose chief mission in life is to cause the rapid decomposition of milk and its products, so notwithstanding the high temperatures milk is really handled with but little difficulty during the most trying periods. And while not presuming to criticise, I believe we should be very thankful to the bright sunlight and dry air for dealing death and destruction to Mr. Bacillus Acidi-Lactici and all his kin, for I have observed now and then a cream separator in rather close proximity to hog pens.

The importance of the creamery over the private dairy or ranch for the manufacture of butter was early recognized by the Californian and while some say here as in other places they prefer the ranch butter to the creamery, I note the latter sells for five to ten cents more per pound and it is almost a safe bet that in such a perishable article the higher price means a higher quality.

The great advantage of not having to build large and expensive barns for housing the cows from four to eight months out of every twelve is one of the first things noted by the newcomer and is another score for dairying in the San Joaquin Valley.

The most interesting observation of all, however, and really only made possible by notations previously made, is the money return obtained from milking cows. Some of the cow stories first told me sounded pretty big and made me think of the statement one sometimes hears that "California has the biggest liars and the smallest stoves of any state in the Union."

After investigation, however, I found these stories to be true; the farmers are getting from $80 to over $100 per cow per year. Not individual cows either, but for whole herds of considerable size. One dairyman near Kerman for last July received $9.31 per cow, for August $9.25, for September $9.55, and $10.30 for October, as an average for 19 cows. I have seen other statements equally as good and find the average is from $7 to $10 a month for the year for each cow. Compared to some of the statements I used to gather and publish with great glee in North Dakota, where the farmer was receiving from $50 to $60 with a greater expense for care, feed and management than we have here, it is no wonder that I am enthusiastic over the dairy possibilities of this locality; especially for the new arrival who must somehow or other made a living for himself and family until such time as he can bring his orchard and vineyard into full bearing, or say four years at the least.

In my observations of the dairy possibilities of the San Joaquin Valley and Kerman in particular, would say in conclusion that with the present dairy stock as a foundation upon which to build future herds; a most fertile soil which grows an abundance of the finest milk producing feed in the world; an abundance of irrigating water; a cilmatic condition that supplies this feed in a green form practically the year round and at the same time is conducive to the health of the animals and the handling of milk; a nearby market ever increasing in its demands for milk, cream and butter, and at such a distance from other dairy producing regions that transportation rates are a veritable tariff wall of protection from lower prices for many, many years in the future; success in the largest measure is assured for each and every one here who is so minded to extract health, wealth and happiness from the gentle cow, the only limit being the care and intelligence exercised in managing the farm, cow and dairy.

ANIMALS IN ARABIA.

By Consul John A. Ray.

An American who has written to this consulate expressing a desire to breed horses in Arabia has been advised that it is impracticable. A fine stallion is never sold to a foreigner and could come into his hands only as a gift from some friend among the Arabs. The country around Maskat is so mountainous that horses are of little use, and are kept only by the wealthy for the sake of their dignity. The recognized market for Arab horses is Bombay.

Secretary James Wilson, of the United States Department of Agriculture declares sugar-beet pulp is the best butter producer in the world. 40c per ton at LOS ALAMITOS SUGAR FACTORY

Some gray donkeys, highly esteemed for riding, are raised in Bahrein. They stand about 12 or 13 hands high and bring about 100 Maria Theresa dollars ($42.50) in Maskat.

The milch goats are no better than those now raised in the United States. There are very few sheep here, and those of very poor quality. On account of the heat, they have almost no wool. The cattle are of the hump-backed Indian variety and are used mostly as work animals. Feed is so scarce that milch cows are fed principally on dried fish and refuse date kernels.

There are two varieties of camels in use here, the dromedary and the freight camel. The dhelul dromedaries are celebrated for their easy riding gait and speed. A dhelul carries about 300 pounds and travels about 6 miles an hour, or 70 miles a day. They can be purchased for 100 to 150 Maria Theresa dollars $42.50 to $63.75). A freight camel carries about 500 pounds and travels about 2½ miles an hour. They cost 300 Maria Theresa dollars ($127) or more. A profitable business in camels is hardly probable.

By some of the ancient nations the hog was considered a sacred animal. By others it was regarded as unclean, and prohibited as food. This prohibition among the Jews was regarded by Tacitus and others as having been because of a feeling that pork was often unfit to eat in warm climates, and apt to encourage the spread of leprosy. Moses is thought to have forbidden the eating of pork because it was liable to give the Israelites diseases that would make them unable to endure the long march out of Egypt. In those days, when cooking was crudely done, there was no doubt much reason to fear trichina.—From Coburn's "Swine in America."

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.

PRODUCE MARKET.—Los Angeles Market San Francisco Market; Deciduous Market, Citrus Market: 462, 463.

Decadence of the Navel

At the meeting of the citrus growers called by Commissioner Jeffrey at Pomona about the middle of September a resolution was passed calling for the appointment of a committee of seven to encourage investigations and to secure aid of the U. S. Department of Agriculture and the state experiment stations, or any other forces which might help in determining a remedy for shy bearing of old orange trees, or, if no remedy exists, to learn what is the age limit of profit bearing. To aid Commissioner Jeffrey in the selection of this committee or rather to pass finally upon appointments, Messrs. A. F. Call, P. J. Dreher and C. C. Teague were appointed by the convention. The committee of seven has now been selected and has accepted the work allotted it. The seven composing it are: C. C. Chapman, Fullerton; A. F. Call, Corona; Dr. J. Allen Osmun, Whittier; P. J. Dreher, Pomona; C. E. Bemis, Covina; R. C. Allen, Bonita; and Harry B. Chase, Riverside. The last named gentleman may not be able to act because of possible absence from the state. This is a representative committee as to communities and as to ability of the men forming it. We believe it will be a committee of action and that something leading to definite results will be done.

Cryptogamus

It is not safe to make any very definite predictions as to results of introduction of new parasites. There have been one or two examples of wonderful work in saving the fruit industry, many have been failures, but now a newly introduced parasite of the mealy bug bids fair to equal the good work of the vedalia with the white scale, though it is yet too early to make definite assertions. Several individual cases of good work on the part of the cryptogamus brought by George Compere from Manila less than a year ago are hopeful indications. One vineyard near Fresno which was badly infested is said to have been completely rid of the mealy bug. It has also proved equally as successful in work on citrus tree infestations. The amount of feed shipped to the state insectary to keep alive the little colony there, with its increase, has been such that the office has paid $1 for expressage. We do not wish to hold out hopes for miraculous results, but would suggest that orchardists who have infestations of mealy bug get in touch with the office of the state horticultural commission at Sacramento.

Use Care

We receive almost every day insects, fruit, and leaves for naming or suggestion as to treatment. Sometimes these are in good condition and easily determined, but often soft-bodied insects are folded in with letter and after experience in the post-office and postal cars arrive at this office mashed beyond recognition. We would suggest that where insects are mailed, small tin boxes or the very small mailing tubes are almost sure to preserve specimens in good condition. Usually leaves mailed in envelopes arrive in satisfactory condition, but if subscribers will observe this caution we can render much better serice.

Flower Show

One of the greatest showings of flowers ever made was that exhibited by the Pasadena Gardeners Association last week in the banquet room of the Hotel Maryland. A great collection of rare plants was the most attractive feature. Dr. Franceschi of Santa Barbara alone had 65 varieties never before exhibited in this state. Many rare plants were shown from the gardens of H. E. Huntington, and a judge of chrysanthemums said he had never seen the equal of the magnificent 'mums displayed. The Pasadena Association has the most active membership of any similar association in the state.

Country Life Hall

Notwithstanding the Country Life Commission did not accomplish all that it might because of the fact that Congress withheld financial support and the commission existed in name only, the people of the state of Washington and especially those of Spokane have advanced money for publishing the findings of the Commission, and in addition the Country Life Committee of the Chamber of Commerce of that city are advancing the work which it started.

One of the latest suggestions of the committee is the establishing of a Country Life Hall to be located in a community center and to be a clearing house for information as to the particular district which it represents. Its keeper should be a Country Life Secretary and a part of his work should be to keep a record of the different kinds of stock and farm crops produced in the district, quantity ready for market, and other general information, at the same time to be in no sense a business manager. A further suggestion is that the Department of Agriculture or the government in some way, award premium ribbons or banners to the farmer in each Country Life District who raises the best corn, the best wheat, the best fruit, the best live stock, or other products. The idea is to make the whole proposition as educational as possible.

Specialized Demonstration

California farmers have received great benefits from the demonstration train secured through the courtesy of the Southern Pacific Railway and the University of California. This train which will soon begin its third annual trip, has endeavored to touch all features of California agriculture and horticulture so far as possible. Iowa has gone us one better for she has specialized her demonstration train. The corn special, the wheat special, and others may be recalled. Now comes the announcement of the breakfast bacon special. Its object is to show how to increase number of hogs, secure more economical feeding, decrease loss at farrowing time, and control other losses. It is stated that the twenty-five per cent loss which the swine breeder has to endure would be fatal to any other business. To save this twenty-five per cent and give greater prosperity to Iowa farmers is the aim of the breakfast bacon special.

The International Dairy Show opens in Chicago on Thursday, November 20th and continues through the following week.

Land Shows

One of the big land show successes last year was the one held in Chicago under the direction of the Chicago Tribune. That was the first of its kind in that city and the second is scheduled for this year from November 19th to December 4th. Thousands of land buyers in many Eastern sections will center in Chicago at that time and secure information which will be gathered together in this big land show. It it estimated that fully a half million people will attend during the fifteen days. Last year's attendance was 350,000.

The show is devoted to exhibits from those sections of the country which are being developed by irrigation; also in a more general way any land opportunity may be presented. There will be exhibits of products, tables of rainfall, analyses of soil, illustrations of private and government reclamation work on waste lands, and of course exhibits of all kinds of implements and development machinery.

Farmers Institutes

Dates for farmers institutes in Riverside County have been arranged by J. B. Neff, Conductor of Southern California Institutes, as follows: Beaumont, November 30; Banning, December 1; Thermal, December 2 and 3. Mr. Neff reports that the people of the Coachella Valley will make an exhibit at Thermal which will be well worth a trip to see. It will consist of products grown under desert conditions, some on alkali land so strongly impregnated that it was predicted no crops whatever could be grown.

"The Control of the Argentine Ant" is the title of Bulletin 207 of the state agricultural experiment station. It is written by Prof. Woodworth and gives the results of two years of investigations of the Argentine ant in California. It reports infestations in East Oakland, Alameda, San Jose, San Francisco, Cupertino, Campbell, Los Angeles, one point near Azusa and another near Upland. All told there are in the state over 5000 acres which may be said to be infested by some 40 separate colonies. The bulletin is illustrated with many drawings of different forms of ants which will aid in identification. Methods of barring out ants by water barriers, destroying by insecticides, ant powders and fluids, and arsenical poisons are given.

The Vice-President of the California Fruit Exchange, commenting upon the shipments of fresh deciduous fruit this season, stated that California fruits kept better and made a better showing on the market and always had special advantages over that from other sections of the country. If this were not true the long hauls and high freight rates would not permit California's fruits to go to market. This advantage should be increased by most skillful packing and attractive packages.

Beginning on December 6 the State Fruit Growers Convention will be held at Stockton under the direction of State Fruit Commissioner Jeffrey who is now preparing a most attractive program. We understand the principal theme will be standardization, and otherwise it will be largely given over to the marketing or business side of the fruit industry.

Agricultural News Notes of the Pacific Coast

Northern California

A spur track is being built to the cannery at Suisun.

The Yuba City creamery is now producing about 350 pounds of butter daily.

Colusa county is spending thousands of dollar on new reclamation propositions.

A live stock sale was held at Birds Landing, Solano county, which netted $11,000.

Marysville, Yuba county, has been successful in experimental plats of cotton this season.

There are about 90 students attending the College of Agriculture at Berkeley this year.

The Western Pacific is planning to move a large portion of the orange crop of Butte county.

Extensive plantings of Thompson Seedless grapes are being made at Yuba City, Sutter county.

Bullards Bar, Yuba county, reports Bartlett pears seven inches long and seventeen in circumference.

Fairoaks, Sacramento county, will ship its largest orange output. Some fruit is already going forward.

Some apple orchards at Day, Shasta county, yielded about a ton to the acre this year and sold at $500 per ton.

Some of the finest olives ever produced in Fairoaks, Sacramento county, will be the result of this year's harvest.

Some exceptionally good hop sales have been made at Santa Rosa within the last week, some being reported at 13½ cents.

A new tract of a thousand acres at Chico has been brought under irrigation and will be planted to sugar beets the coming season.

A sheep poisoner has been at work amongst the flocks of Sonoma county and farmers are loading their shotguns and hoping for a chance at him.

Bean growers of Sacramento county will make exceptionally good money from their output this year. They have received $4.25 per hundred as against 85 cents a few years-ago.

Olive gathering in the groves about Oroville, Butte county, begins about the first of this month, which is earlier than usual. The crop is not quite so heavy as last year, but is of exceptionally fine quality.

A suit to condemn rights of way for an irrigation system has been brought in the Superior Court of Tehama county against the Central Pacific Railway. The right of way desired is to be 100 feet wide.

A large milk condensing plant is to be established at Arcata, Humboldt county for the production of "Carnation" cream. It will call for an investment of about $50,000.

The grand jury for the northern districts of California has found indictments against several canning companies of this state because of the labeling of "adulterated and decomposed vegetable substances as pure fruit."

Central California

Lindsay is now shipping ten to a dozen cars of oranges daily.

Livingston, Merced county, is in full swing with its harvesting of sweet potatoes.

It is said that there are 425,000 acres of land open to entry in the Visalia district.

Much land near Laton, Fresno county, is being benefited by artesian well irrigation.

Lodi's Tokays have sold well, but later receipts have not been quite so satisfactory.

Kerman Malaga and Cornichon growers netted $40 per ton for many of their shipments.

Exeter has decided to make extensive exhibit at the coming Nevada County Citrus Fair.

Dinuba is in the midst of its Emperor grape shipping campaign, the greater part now being picked.

The prune market remains quiet and the demand now is more largely for big sizes and more desirable fruit.

C. A. Kimball, a sheep dealer at Hanford, recently shipped two cars of Rambouillet yearlings to an Oregon sheep herder.

The third season of the San Joaquin Valley Conservation and Irrigation Congress will be held in Los Banos next Saturday.

California division of the Farmers Union will convene at San Jose, November 15, 16. The national president will make an address.

The Merchants Association of Visalia has decided to give the streets of that city a brilliant illumination during Citrus Fair week.

An organization of poultrymen has been effected at Santa Cruz and a decision reached to hold a poultry and pet stock show in July next.

Secretary Miot of the Tulare County Board of Trade is in Chicago in charge of the Tulare exhibit at the Irrigated Lands and Products Exposition.

Tulare hopes to have a cannery in operation before another season, and to that end $16,000 has been subscribed by the merchants of the town.

It is reported that the "High Five" are bearing the market on raisins. The principal demand so far is for goods which can be worked over into layers.

The management of the Tulare county Citrus Fair, Dec. 5-10, has planned an advertising campaign, one feature of which is the distribution of 20,000 post cards.

The Kings County Fair Association directors find that owing to the stormy weather during the fair receipts were not quite sufficient to pay premiums and all expenses.

The committee appointed by the Fresno Chamber of Commerce to investigate as to size of the present raisin crop has not yet reported and the market is in a very quiet and waiting attitude: It is rumored that packers are anxious to force down to 2½ cents, but growers are unwilling to sell for less than 3½.

Southern California

Orange county shipped 2,800,000 eggs during the last year.

Fullerton district will produce about 35 per cent less walnuts than last year.

Big Rock in the Antelope Valley is proving a very profitable apple producing section.

Weaver Bros. of Imperial are importing from Missouri a number of very fine Berkshire hogs.

Imperial Valley has already shipped out 500 bales of cotton. The picking is done largely by Indians.

One company at Perris, Riverside county, will plant 100 acres to eucalyptus during the coming season.

The contractor for the new sugar factory at Anaheim has broken ground and begun construction.

The Olive Pickling and Oil Co. of Bloomington, San Bernardino county, is employing much outside labor.

The midwinter tomato industry is becoming a great factor in the frostless sections about Los Angeles.

A thousand dollar income from ten acres of alfalfa seed is reported from a Hemet, Riverside county, farmer.

Lemon growers are greatly disappointed at the ruling of the federal court advancing the rate on lemons.

Redlands shipped 3880 cars of oranges during the last year, which is about 700 cars below the preceding year.

It is now predicted that within a short time shipments of oranges will be made by water and the Panama Railway.

The contract for a new sugar factory to be built at Huntington Beach has been let to the Carl Leonardt Co. of Los Angeles.

Antelope Valley dairymen are appealing for a cheese factoy and one has practically been promised if 2000 pounds of milk daily can be assured.

In the report of the Sunset Fruit Exchange of Orange county the manager showed an expense for grading and packing of a cent and a quarter per box.

The section between Escondido and the ocean in San Diego county is proving to be an exceptionally fine bean producing country. One planter there has 1400 acres of limas and blackeyes.

The election of the Fernando Fruit Growers Association resulted in placing of the following board of directors: H. P. Canby, F. A. Powell, R. P. Waite, C. D. Hubbard, R. H. Maclay, John Burr, and F. A. Fletcher of Whittier.

Ontario, San Bernardino county, has regarded with pride its Euclid Avenue 15 miles long and 200 feet broad. and is now much disappointed that many of its older trees are dying because of lack of care and water.

Special agents of the State Fish and Game Commission investigating work of squirrel poisoning in Santa Barbara and San Luis Obispo counties have declared that many game and song birds are being destroyed.

The Coast

Walla Walla apples are readily commanding $1.50 per box.

The yield of corn in Texas this year will be 129,000,000 bushels.

Portland gets the next meeting of the National Wool Growers Association.

Arizona's population is credited as 204,354, an increase of 66.2 per cent in the last decade.

Apple shippers at Eugene, Oregon, have lost some sales this year because of lack of boxes.

The winter short courses of the Oregon Agricultural College will begin on January 3rd.

Three new instructors have been chosen for the Oregon Agricultural College at Corvallis.

A four-state convention on good roads was recently held at Walla Walla, Washington.

Hundreds of sheep have been lost near Dayton, Washington, by depredations of wild animals.

The first Canadian National Apple Show was held at Vancouver, B. C., beginning October 31st.

Josephine county, Oregon, has picked its banner crop of apples which aggregates about fifty cars.

One sorghum grower at Sulphur Springs Valley north of Douglas, Arizona, produced a $4000 crop from an investment of $350.

The Oregon Short Line will run a farmers institute special through the northern part of Utah and in Idaho during the month of December.

The Boise, Weiser and Payette Valleys of Idaho shipped this year 1050 cars of prunes which netted more than a million dollars to the growers.

A unique feature at the Interstate Fair at Spokane is to be a great monument fifty feet in height built in the form of an obelisk and of baled hay.

The Venezuelan Government has ordered the establishment of a section of plants and seeds under the agricultural division of the Ministry of Commerce (Fomento), which is charged with the importation of seeds and plants.

Mexican rubber shipments in 1907-8 amounted to 5,624 tons; this was greater in 1908-9, being 6,015 tons; at the same time, there was a slight decrease in the value of the exports.

The chief agricultural exports from Mexico are henequen (sisal hemp) and coffee. Of the former 107,809 tons, value £2,438,027, was exported, as against 110,746 tons, value £2,758,224, in 1907-8.

Fresh fruit from Mexico finds an excellent market in the United States, and the amounts exported in 1907-8 (7,239 tons, worth £38,430), increased to 9,351 tons, worth £49,305, in 1908-9.

An 18-inch branch from a pear tree on the A. M. Smith farm, west of Corvallis, Oregon, contained 22 pears, all of large size, and several of them five inches in length. Many other branches on the tree show almost as great fruit growth.

Coulson's

EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying powers and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the famous Coulson products and gives valuable information about Poultry Raising.

Coulson Poultry & Stock Food Co., Petaluma
Germain Seed & Plant Co.,
Distributing Agents for
S. California

The worst thing we have to contend with in getting new customers to try

West Coast Egg Food

is the "stuffs" that have been put on the market called "egg foods," largely composed of unsound grains, mill refuse, and cheap, very cheap, Japanese rice bran and such offal. When we once get a trial of "West Coast" we have no further trouble. No such stuffs in ours. We are winning out in great shape by making first-class feeds at prices as low as those "cheap" ones. Try "West Coast" just once. 75-lb. sack only $1.80, or $45.00 per ton. If not sold by your dealer, send to us. Or, if you are distant from Los Angeles and have good grain products cheaper than to ship them in, you can make your own Egg Food as good as anybody's.

Egg-More Booklet

tells you how. It is free. Send for it. Send us addresses of 5 persons in your vicinity who have fowls, and we will send you an Anchor Egg Separator. Or, for 20 addresses, we will also send The Poultry Manual, a book well worth 50e, both postpaid.

West Coast Mill

Office and Salesrooms, 115 Winston St.
Los Angeles, California

MORE CHICKENS—MORE EGGS AND MORE PROFITS

Big demand for poultry products at top notch prices—makes the chicken business *better than ever*. Go into it *right*. Pacific Coast poultrymen testify that

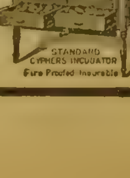
Cyphers Incubators and Brooders

the World's Standard Hatchers, give the *best results* in meeting Coast conditions and requirements. The Cyphers is a genuine non moisture incubator; self-regulating, self-ventilating. It is used by more Government Experiment Stations, by more poultry fanciers and on more big and successful poultry plants than *all other makes of incubators combined.*

The Cyphers Is Particularly Adapted to the Pacific Coast Climate

You can rely upon the results from the Cyphers—*hatch after hatch*. Mr. C. Flewelling of Petaluma, Cal. uses 11 Cyphers and averages 75% of the total number of eggs set. Bertha M. Story of Oregon City, Ore. says "I rarely have less than a 90% hatch of good strong chicks." Cyphers Incubators and Brooders are fireproof and insurable. We guarantee Cyphers Incubators and Brooders absolutely and are right here on the coast to back our guarantee. Write today for our big handsome book: "Practical Poultry Raising" and 1911 catalog of Cyphers Incubators, Brooders and Poultry Supplies.

Cyphers Incubator Company, Dept. 46, Los Angeles, Cal. Also Buffalo, N.Y.



Practical Poultry Culture

WHEN THE CHICKENS ARE SICK.

By Bee Josephine O'Mealey.

No, chickens are not more liable to disease in California than elsewhere. People never ask how to remedy a defect which is not manifest. We never run after the train we have boarded nor fret about the delay of the train which is on time. So, very few persons doctor the chickens which have not shown signs of sickness; unless, indeed, it be some forehanded person like the Indian woman whom I saw a couple of years ago.

She had three or four clean, quiet, mannerly little folks with her in the strawberry field. Near them was a white family whose ten-year-old girl was the antithesis of the little Indians in behavior, in short, as disagreeable as only a spoiled child can be; the contemptuous rudeness of her manner toward her doting parents made the little Indians' mouths stand agape with horror. Noticing her fascinated attention, the Indian mother reached over and gave her papoose a couple of slaps over the head, which speedily distracted her attention, and that most effectually, with the stern remark: "Never you try that." Her plan while somewhat drastic, was a wise one; to meet trouble before it started and bar its progress from the beginning. And the best time to doctor sick chickens is before they show symptoms of ailment. I have spent many hours answering inquiries regarding roup, but never had a case of it in my own flock; have never seen a case of pip or gapes and am fully content if I never will. Blessed is contentment!

The chicken family is naturally healthy and has little tendency to disease if properly bred and cared for; and it is safe to say three-fourths of their ailments are preventable ones. Cleanliness is next to godliness and certainly synonymous with self-respect, but the filth I have beheld in some henhouses would indicate a tremendous lapse of something—energy, if nothing worse.

A wealthy farmer once asked us to go and see his chickens and see why they did not do better. The henhouse was about ten by twelve with fairly tight board walls and shed-roof. The building was guiltless of windows, ventilators or any such frivolity. The perches were made of split fence rails, the first one lying in the filth at the door sill and ranging up stair-step fashion to the roof at the back, and the space behind these perches was filled in solidly with excrement, so that each rail was partly imbedded in it, and the number of mites and lice cosily sheltered in the splintery surface of the rails was beyond the power of a whole college of mathematicians to compute.

Chickens are creatures of unreasoning fixity of habit, so they went nightly to that vermin-infested abomination to be poisoned by all night inhalation and have their blood sapped from them by those insatiable parasites. Did you ever get a few chicken mites on yourself? Recall how frantic you were. Imagine then how a hen feels when her feathers are full of the bloodthirsty crawlers.

And then when you start out to exterminate the unwelcome things, do use some judgment. Don't drench a hen with kerosene or dust her with fresh lime. We have found a mixture of 1 cup lard, 2 spoons sulphur, spoons insect powder, ½ cup kerosene well mixed and applied around neck, vent, under wings and legs, to be very effective and it does not take so long as you might think to take a hundred chickens off the perch and grease them.

Few houses are tight enough to make fumigation practicable, so other means must be employed to rid the houses of vermin. A large-sized machine oil can filled with kerosene and thoroughly spurted into every crack or crevice will usually do the business.

However, if you are very careful, there is a more effective way. Provide an ample supply of water. The garden hose if you have it or at least a couple of tubs of water and a big saucepan for a dipper. Oil the perches and walls, then with a torch burn the oil off, being ready to apply the water whenever the fire bids fair to be too energetic. Provide liberal dust baths with plenty of air-slaked lime and sulphur and put air-slacked lime in the nest-boxes and also on the dropping-boards, for of course you use dropping-boards. But whatever you do you must do it over and over again, for while I cannot agree with the many who argue that lice and mice grow spontaneously, they do certainly multiply faster than a patent lead pencil.

Since coming here I have made the acquaintance of some large brown flat bugs—a sort of improvement(?) on the "mahogany flat" occasionally met with in human habitations. They seemed indifferent to powders or kerosene; boiling water affected only individuals, not the masses, and I finally adopted the slow, unpleasant, but thorough, method of jarring them out of the cracks wherein they had hidden, or digging them out with an old knife and dispatching them one by one, as the Frenchman recommended for the fleas. It was slow and nasty but I finally got rid of them.

Fully three-fourths of the poultry ailments are due to filth or vermin; eliminate these and you have plain sailing.

If your chickens appear to have droppings too loose put a bit of alum in the drinking water. If you feed any food which has fermented, sweeten it with a generous spoonful of soda.

One occasionally hears a query about the use of salt. Yes, salt their food as you would your own, it is beneficial and may avert trouble.

THE SOFT ROASTER.

What is a soft roaster? Dr. P. T. Woods answers this question in American Poultry World as follows: "Simply a quickly-grown chicken, well fed, and marketed while still soft-fleshed. Usually the males are caponized at an early age, as this practice results in more and better flesh which will keep soft for a longer time. The pullets also are sold as soft roasters and are pushed as rapidly as possible for flesh production to get them into the market before they begin laying. When egg production is well established, the pullet is no longer in the soft-meated class. Formerly the term soft roaster applied almost exclusively to winter-grown chickens, chiefly capons. * * * At the present time the production of fancy soft-meated roasting chickens is becoming popular in many sections of the country although the production of these superior market chickens is by no means general." Dr. Woods thinks that there is a field for both the small and large producer, who living convenient to a good sized town or city market, can readily reap substantial profits in return for a little effort. Good quality chicken meat marketed in good order will always find ready buyers. In a new market it may be difficult to get topnotch prices at first, but quality will create a demand, and an increasing demand is sure to be followed by an increase in prices. It costs, proportionately, very little more, he says, "to make a roasting chicken than it does a broiler or fryer. Most of the risk or loss, from the various causes of chicken mortality, as well as the greatest cost per pound of chicken meat, comes during the first two months of the chick's life. After they are six to eight weeks old, and most of the chick dangers are past, flesh can be put on very rapidly at comparatively small cost. Six to eight weeks old broilers may bring in the market from fifty cents to a dollar each dressed, according to the season and the demand. The same birds, if caponized and held for four months longer, at a cost for food and caponizing not to exceed 50 to 65 cents, should bring from $2 to $3 each alive."

"Isn't it worth while?" he asks.

POULTRY AND FRUIT.

A flock of poultry in connection with fruit growing, gardening, or a small dairy business, is often more profitable than an exclusive poultry business. If there is a market for milk, butter, buttermilk, cream or cottage cheese, a cow or two could be kept with profit in connection with the poultry, says Wallace's Farmer. Cows and chickens thrive admirably together, and the chickens furnish a market for surplus milk.

Small fruit, strawberries especially, make a profitable crop in connection with chickens, as the poultry manure is especially beneficial to the berries, a strawberry bed makes an ideal scratching place for baby chicks after the fruiting season, and the berries ripen when the hardest work with the chickens is over. One should not go into the small fruit business, however, unless he is sure of securing pickers for the crop, and has a reasonably good market at hand. The help at hand must also be considered; there is no prospect of success in a business which requires the attention of two men and receives the care of one. If there is more work than the owner can give his personal supervision to, the profits are less than from a small business carefully supervised. One is always safe in going into the poultry business in connection with other crops, so long as he keeps out of debt, and there is no more work on the place than the help available can do as it should be done. Market gardening, growing onions especially, may be a profitable branch to take up. If a market can be found for them, the growing of bulbs is a remunerative employment with no very hard work. Here there are two crops, the blossoms and the bulbs, provided you can arrange with a seed company to take the produce.

NEW GAPE CURE.

A writer in Farm and Fireside, speaking of the horsehair treatment for gapes, says that it strikes her that it is rather a brutal plan and tells of the accidental discovery of a very successful treatment for this disease:

"Take corn-meal, enough for a good feed for all the gaping chicks on hand. Mix the dry meal with one-fourth as much black pepper, then add boiling water and stir—don't get the mixture too soft. When it is cool enough, feed the chicks all they will eat. One dose is enough if given in time; two doses will cure, anyway. You don't have to waste time attending to each chick. I have not lost a chick with gapes since taking up this cure.

"I used to treat gapes with a feather dipped in turpentine run down the chick's throat, and never saved one of them. One day when I was seasoning some potatoes the lid came off the pepper-box. The potatoes were too peppery for the table, so I fed them to about twenty chicks that had gapes badly—I thought it couldn't make them any worse off. When I went to feed them again there was no gaping and I raised all but two that a rat caught.

"Since then I have fed pepper not simply in bad cases, but with the regular rations. When the little chicks first begin to eat, I cut cooked potatoes fine, season quite black with pepper and feed this twice a week, until they get well feathered and there is no more real danger from gapes. I have cured hard cases, too."

MOISTURE FOR THE INCUBATOR.

The problem of moisture is rather a difficult one to solve. In this climate, when results are not satisfactory it is often found beneficial to increase the amount of moisture recommended by the incubator manufacturer and this is the hypothesis on which the La Belle poultry ranch, the largest hatchery in Colorado, is working. A good way to supply moisture is by the use of pans containing an inch of wet sand in the nursery trays. And as a rule a hatch can be improved by sprinkling the eggs with warm water several times when the chick are hatching. Use water fairly warm but not scalding and sprinkle with a whisk broom. Pull out the trays and sprinkle as quickly as possible and at the same time remove as many of the empty shells as can be grabbed up quickly, as many chicks are smothered by the empty shells falling snugly over the shells out of which they are trying to work their way. It does no harm to leave chicks in the incubator for a day after the hatch.—N. W. Farm and Home.

When turkeys are six weeks old I begin to feed them kaffir corn, then as soon as possible, I get them to eating whole grain corn. I first begin by feeding them small grain corn. At this age I feed them twice a day, early in the morning and late in the afternoon. When they are fed late in the afternoon I think it will induce them to come home to roost. I keep this up until the first of October, then I begin feeding them all they will eat, twice a day, until they are marketed.

Never change to a new breed simply because extravagant claims are given. It is better to try to improve the old ones.

I'll Start You in Poultry on the Make-Good Plan

—Set you up in a paying business all your own—a business you can control and expand indefinitely—one you can operate on little capital and in small space—one that will give you real independence, pleasure and profit. Mail me a card to-day for my book containing the remarkable terms on which I am selling Queen Incubators and Brooders, freight prepaid. I have started over 61,000 people on the road to success. The Queen goes out on the make-good plan, the most liberal ever offered on a high grade incubator. My 1911 Poultry Guide and Catalog explains terms fully. It's a down-to-date poultry book, practical, concise, helpful—best book of the kind published. Write and let me mail it to you free.

BY BIKE AND HIKE THROUGH NAPA.

By Nat. E. Luce.

It became the writer's pleasant duty to take a trip through these North Coast counties in the interest of the Cultivator, and in making the trip on wheel and on foot one comes in contact with the country as in no other way. One can get a closer line on soils, scenery and even climatic conditions by this method of traveling than by any other means; it brings one in direct contact with nature and nature has been lavish with Napa county. The soil rich and warm, climate surpassed by none and productiveness bountiful.

Perhaps the one great feature of beautiful Napa Valley is its system of splendid highways and stone bridges which span its numerous streams, and still they are keeping right at it making new ones and the old ones better; many counties in all parts of this great state could well pattern after her.

Transportation facilities also help Napa county to grow and prosper. Two lines of steam railways, one fine electric passenger and freight line direct to the city of San Francisco, and a line of freight boats from the head of navigation at Napa to San Francisco, with daily service.

Beautiful Napa Valley has many natural advantages to offer the snowbound farmer of the East. Here he can till the soil as he did back there, as no irrigation is needed. Abundant rainfall and a splendid soil make record crops of all kinds. Here cherries, prunes, apricots, peaches, apples and grapes grow to perfection. There are large stock and dairy farms, an intelligent, wideawake class of ranchers, who take an interest in the affairs of their county.

In scenic beauty she can well be called a gem, the main valley about fifty miles in length with several smaller valleys contributary to the main valley. These dotted with oak, pine and redwood, help to make it picturesque and charming. Napa is the county seat. It is a fine little city with paved streets, fine walks, splendid business buildings, churches, and a live chamber of commerce.

St. Helena is a most picturesque and beautiful little town north of Napa and looking up to its namesake Mt. St. Helena. Here is comfort, peace and plenty for the tiller of the soil. The largest stone wine-cellar in the world is located here.

Calistoga is a good-sized town in the northern part of the county and is a popular place for the tourists; these with many smaller villages go to make up Napa's towns and cities.

I have only briefly touched on many of the things which make Napa what she is, prosperous, scenically beautiful, rich in soil and climate, with abundance of good water for all. It is with reluctance that I leave her, for she is kind to the stranger within her gates, and at some futue time I hope to return to this gem of counties for a longer stay.

A Vineyard Scene in Beautiful Napa Valley.

NEIGHBORHOOD INTELLIGENCE.

How many instances of the following kind can be found in the United States? Professor Fraser tells of eighteen dairy farms near Kilmarnock, Scotland, where a high type of Ayrshire cows are kept. All the cows on these farms, includng heifers with their first calves, average 6,920 pounds of 3.9 per cent milk. How was this done? By the old fashioned way of entering into a mutual study and effort by these eighteen farmers to be just as intelligent in their methods of breeding and rearing their cows as possible.

Here in the United States it is every farmer for himself and the "devil take the hindermost." We could do the same thing with any breed and in any neighborhood if we would consent to work together for it. Take any creamery neighobrhood as a unit. Establish a cow testing association of 26 farmers in single groups. Unite each group on some one breed. Keep the cow testing going year after year. Let each group have a secretary and have frequent meetings to discuss the facts as they are brought out. Let the cow tester keep a record of the results with those who have silos, ventilated stables, the effect of different feeds, roughage and grain. Think of what a mass of valuable information and final conclusions could be worked out in each neighborhood group. What a long way we are from where we might be.—Hoard's Dairyman.

Bees and Their Care

STATE BEE-KEEPERS' MEETING.

The executive committee of the State Bee-Keepers' Association is planning for the next annual meeting to be held some time during the month of December, probably well towards the end. The legislation committee is laboring on a new bill which it is hoped will take the place of the present unsatisfactory one controlling apiary inspection. This has been before the association for the last two years and it is hoped the matter will be threshed out to a finish at the coming convention. If it is, it will be then placed in the hands of the legislative committee to rush through the state legislature during the coming season. The legislation committee is composed of Messrs. Burdick of Redlands, Mendleson of Ventura, Ferree of Newhall and Benton of Los Angeles.

BEES.

There is money in beekeeping if it is managed properly. Bee keeping is now being carried on with both profit and pleasure by many thousands of people in all parts of the United States, and while, as a rule, it is not the sole occupation of those who pursue it, there are many places where an experienced beekeeper can make a good living by devoting his entire time and attention to this line of work.

The average annual honey yield per colony for the entire country should be from 25 to 30 pounds of comb honey or 40 to 50 pounds of extracted honey. The money return to be obtained from this crop depends entirely on the market and the methods of selling the honey. If sold direct to the consumer, extracted honey brings from 10 to 20 cents per pound, and comb honey from 15 to 25 cents per section. If sold to dealers, the price varies from 6 to 10 cents for extracted honey and from 10 to 15 cents for comb honey. All of these estimates depend largely on the quality and neatness of the product. From the gross return must be deducted from 50 cents to $1 per colony for the expenses other than labor, including foundation, sections, occasional new frames and hives, and other incidentals, not, however, providing for increase.

These figures, however, are based on a system of good management. Beekeeping to be profitable requires hard work, knowledge and experience. Much study is required to insure success. It is unwise, therefore, for the average individual to undertake extensive beekeeping without considerable previous experience on a small scale, since there are so many more details which go to make up success in the work. Learn the ways of bees, how to handle them, and what kind of equipment is best. Then begin on a small scale, make the bees pay for themselves and for all additional apparatus, as well as some profit, and let the business grow gradually.

Above all it should be emphasized that the only way to make beekeeping a profitable business is to produce only a first-class article. We cannot control what the bees bring to the hive to any great extent, but by proper manipulation we can get them to produce fancy comb honey, or if extracted honey is produced it can be carefully cared for and neatly packed to appeal to the fancy trade. Too many beekeepers, in fact the majority pay too little attention to making their goods attractive. They should recognize the fact that of two jars of honey, one in an ordinary fruit jar or tin can with a poorly printed label, and the other in a neat glass jar of artistic design with a pleasing, attractive label, the latter will bring drouble or more the extra cost of the better package. It is perhaps unfortunate but nevertheless a fact that honey sells largely on appearance, and a progressive beekeeper will appeal as strongly as possible to the eye of his customer.

Much information along these and other lines in beekeeping can be found in a new publication of the Department of Agriculture, Farmers' Bulletin 397, entitled, "Bees." The aim of this work is to give briefly the information needed by persons engaged in the keeping of bees, and to answer inquiries that are frequently received from correspondents of the Department. It discusses the location, equipment, and stocking of the apiary, the habits of bees and their manipulation, the production of honey and wax, wintering, and diseases and injuries. It also gives such general information as how to obtain and introduce queens, laws affecting beekeeping, and journals and books on the subject. This publication can be obtained free as long as the supply lasts, by applying to the Secretary of Agriculture, Washington, D. C.; it may also be secured from Senators, Representatives, and Delegates in Congress; and the Superintendent of Documents will sell it at 5 cents per copy.

A HARD SEASON.

J. W. George of Imperial writes that it has been hard this season to keep his stands of bees up to the usual number of colonies. In fact his apiary is over 300 colonies short. The season has been the limit for losing queens.

Some sections of the valley are overstocked and suffering some because of short pasturage. The growth of the cotton industry will doubtless reduce the alfalfa acreage. The cotton plant furnishes plenty of pollen but little honey.

BEAN WEEVIL.

The bean weevil is the most important insect pest of the bean. It attacks the pod of the growing plant and continues to breed in the stored seed. It is impossible to use field measures against this pest, but it is an easy matter to prevent damage to stored seeds. All seed should be treated with carbon bisulphide at time of storing, using one ounce to each 100 pounds of seed. It is necessary to place seed in tight boxes before treating. The liquid is poured directly on top of the seed in the bin or box and the seed is then covered with carpet or old sacks. Great care should be used in handling the carbon bisulphide, since the gas is both inflammable and explosive. Never use the remedy in a room containing fire, or a hot steam pipe.

SPRAYING FOR HOPPERS.

In the Delano Record we note the following spray, given by L. W. Burr, Horticultural Commissioner of Kern County, to protect trees from grasshoppers. It's a deadly poison and we question the advisability of its use. However, in a desperate case it may be tried.

I think the "hopper" can be easily checked by spraying the trees with a solution of cyanide of potassium; say one ounce to one gallon of water; not stronger. The trees must be thoroughly sprayed, however, so as to cover as much of the foliage as possible.

Care must be taken in handling this solution, as cyanide is deadly poison, and poultry must be kept from eating the dead grasshoppers and animals must not be allowed to eat the grass on which cyanide has dripped.

It may be that this proportion may be a little too strong, but I do not think so. Try it on one tree first, and if, after twenty-four hours, the foliage shows no signs of burning, the strength is all right; if it does burn, add more water.

For vines, it would probably need to be weaker, as vine foliage is much more tender and more easily burned. I think perhaps half the strength given above, or one-half ounce to one gallon of water might do the work. Try it full strength first, and if it burns, dilute.

For "diabrotica" use as for the "hoppers," remembering to cover all the foliage. One bite is usually enough to send the predatory insect to bug heaven.

This proportion is given for our hot, dry climate only. In a damp climate it might not work as with us, but might burn the foliage badly, and I think the reason is that with us the solution dries quickly, and while the poison will remain on the foliage some little time, the corrosive action ceases almost at once, while in a damp climate it would not dry so readily and the corrosive action would be longer kept up. But try your proportion on one tree or vine first.

Irrigation and Forestry

DRY FARMING LAND.

W. H. Babcock of Los Angeles, who was the pioneer of extensive wheat growing in Washington and the first man in the Pacific Northwest to get into the 100,000 bushels a year class of producers and claims the world's championship for conquering sand dunes, has been visiting friends in Spokane for a week. He is the typical pioneer of the west, and he is as rugged today as in the days when sturdy men blazed the way through the passes to discover the rich country on the west side of the Rocky mountains.

While in Spokane he visited the headquarters of the Dry Farming Congress in company with E. F. Benson, land commissioner of the Northern Pacific Railway company, who years ago sold several thousand acres of sand dunes for almost a song to Mr. Babcock, provided he would seed the land and stop the sand from drifting upon the tracks. Mr. Babcock still holds a large acreage of this land in Walla Walla valley, and it is today, as it has been for years, producing high grade wheat.

"I formerly lived on Eureka flats in the Walla walla Valley," said Mr. Babcock. "Those flats were wide expanses of sage brush and sand dunes in the early days and a drearier place could hardly be imagined. I settled there 30 years ago and I am returning to find it one of the finest and best cultivated districts in Washington. A wonderful transformation has taken place. Little did I realize when I tried to get a living off that sandy land that I would live to see it a veritable garden of Eden. But it's so, and it does my heart good every time I return on a visit to look over the country. Mr. Benson shoved it off on me, and I thought many a time he was trying to make me ride a goat, but I beat him to it and I guess he would like to own some of it today."

"I was the first farmer in that district to adopt dry farming. I cultivated so as to keep the weeds out, and I cultivated thoroughly, too. I had to, as it was a country of nothing but sand, sage brush and weeds. I used to harrow extensively, and I found it a Crack-a-jack weed-killer. I plowed at various depths, because it was a sort of an experiment on my part, and I followed up the harrowing by hoeing. It told every time.

"The land was a rounding knoll of drifting bluish sand, which blew onto the railroad track with every wind and drifted like snow. Every time we had a heavy wind, the track would become impassable and it got to be a steady job for shovelers from Walla Walla to keep the track clear. Trains would be stalled there for hours; sometimes all day while the laborers were shoveling the sand off the roadbed.

"Mr. Benson talked with me a dozen times on the possibility of growing some kind of vegetation that would keep the sand dunes from shifting, and I finally agreed to experiment and said I would pay 50 cents an acre for the half section if I could make anything grow on it.

"I seeded it to rye in September, but the dry weather and the wind in the fall made my work almost a total failure. There were a few spots where the sand had not drifted so badly that made a little growth. This encouraged me and the next year I seeded 80 of the 320 acres that was wholly sand dunes and I got a part of a crop. Then I concluded I had mastered the sand, and I seeded the entire tract and got an additional acreage to grow. The next year we had a wet fall and the entire half section did well and I threshed 18 bushels of rye to the acre.

"I did not dare to plow that land for four or five years, but continued to crop it each year; first to rye and then to wheat, until the rolling sand dunes were recognized by everybody on Eureka flats as being a profitable wheat field. Since then I have plowed and cultivated it the same as any other land in the country and it is growing some of the finest wheat. This year, despite the drouth, I had a big yield, all due to the application of dry farming methods."

FOREST FIRE PROTECTION.

One of the lessons which will finally be drawn from the trying experience of the present forest fire season, in the belief of officials of the U. S. Department of Agriculture, is the need of wider organization among private owners of timber to safeguard their holdings.

It is pointed out that already in the Northwest, both on the Pacific Coast and in Montana and Idaho, timberland owners have formed themselves into associations which assess the members on an acreage basis and thus meet the cost of maintaining a regular patrol and fire-fighting organization. Only by getting together can private owners usually assure themselves protection, for fire is no respecter of boundary lines and the man who undertakes to keep it out of his own timber will want it kept out of his neighbor's too. Wherever possible the Government's forest officers co-operate with the force put in the field by the associations, so that the employees of the Government and those of the private owners are handled practically as a unit in fighting the common enemy.

This co-operation is advantageous to both sides. Protection of the National Forests necessarily carries with it a good deal of protection of adjoining or interior holdings. If the private owners would everywhere shoulder their reasonable share of the burden, the public would gain both through more general forest conservation and through relief from the necessity of paying for the protection of private timber in order to protect its own.

IT WOULD FIDGET.

"The word 'fidget,'" explained the teacher, "means to move about. Now, children, I want one of you to step to the blackboard and write a sentence containing the word 'fidget.'" Forth stepped the little Wise boy, who write, "This store will fidget June first." "But who ever heard of a store fidgeting, Johnny?" asked the teacher. "I don't know; but the sign on a store downtown says that it will move about June first."—Judge.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Tuberculosis.

I fear my cow has tuberculosis. Is there a state officer who will test her, and is the test sure? She does not cough, but grows exceedingly thin during the winter, then fattens up well during warm weather. Is raising valuable heifer calf. Is there danger to the calf from drinking her milk?—Subscriber, Lodi.

I should certainly feel as you do about this cow and would have her tested at once. There is no state officer for this purpose. If there was one I doubt if you would wish to have him as the matter would become very public. No one really desires to keep diseased cattle, but when they have them it is rather cruel to make them the butt of public remarks, especially when they are doing their best to find out the trouble. Any veterinarian can test a cow or anyone that can give a hypodermic injection of the tuberculin into the side of the neck and then take the temperature by the rectum. I would have a good man do it the first time and stay to see the whole process. After that you can do it yourself at any time. In this case listening to the lungs as the breath enters and leaves them may show you exactly where the trouble lies. Many cows that have this disease for years grow better in the warm weather and worse each winter. These are the dangerous subjects as they deceive as to their true condition. The tuberculin test is certainly very reliable and the per cent of failure is too small to consider. The case it fails in is not one that is dangerous. It sometimes is confused on cases of very advanced stages, the hectic fever and the reacting of the tuberculin coming into conflict. These cases are always those that physical examination would exclude from the herd as diseased. The tuberculin acts as a detective in running down the cases that are not advanced enough to attract notice and yet are spreading the disease to other cows. Boiling the milk should destroy the bacilli. Boiled milk is good for the pigs but not at all pleasant as human food or is it wholesome to feed to the calves.—M. E. S.

Keeping Fruits in Vacuum.

Is it possible to keep fresh articles a room from which the oxygen has been removed by burning chemicals, the place to be shut and air tight? you have concrete cellar, air tight, it possible to pump out air so as cause a vacuum that will preserve perishable fruits? Has this ever been tried and with what results? How strong a machine would be required and how much pressure does a vacuum produce to the square inch?—F. H., Brawley.

Some fruit was shipped from California to Eastern points in ordinary refrigerator cars prepared by burning chemicals so as to remove oxygen, but we believe this did not prove a practical success. A similar process has been recommended and at times powders have been sold as food preservatives, and we believe the secret all these has been the removal oxygen from around food. While in theory, and at times in actual practice, fair results may be obtained, on the whole such efforts have been failures so far as we have ever learned. The removing of air from the concrete cellar would be absolutely impractical and much more expensive than ordinary cold storage. The pressure per square inch in perfect vacuum is nearly 15 pounds—14.7 to be exact.

Seeding Alfalfa.

What is the best time to sow alfalfa, and is there danger of too deep planting?—O. S., Reedley.

The season has more to do with successful seeding of alfalfa than the calendar months. We seed in this section, Fresno county, any time after Christmas up to the middle of March. We avoid sowing in a frosty spell. These come when it is dry and add to the dryness of the soil. Last spring the long dry spell injured much of the sowing and good stands were the exception. The field should be plowed deeply as soon as possible in the fall, harrowed and let alone until about a week before planting. Then run over it with either a shallow set plow or with a cultivator, harrow and sow the seed lightly and brush it in lightly with a brush harrow. If you have a drill to put the seed in with, it will only take about half as much seed to get a good stand. Alfalfa seed follows the usual rule in sowing, one and a half times the size of the seed under the loose soil.—M. E. S.

Leaking Milk.

Cow three years old, though not fresh, leaks milk when lying down. Is there remedy or must she go to the butcher?—E. D., San Jose.

Try using a little collodium on the end of the teats after milking. If this does not hold the milk enough and the cow is milked often enough and not fresh, I know of nothing else to do for her that will overcome this trouble. The loss, however, may not be as great as you think as the fore milk of the cow is poor in quality. The fore milk or first quarter of the milk drawn often is not over two per cent butter fat while the last of the milk is five to seven per cent fat.—M. E. S.

Diseased Peach Roots.

I send roots and twigs from peach trees. What is the cause of enlargement of roots and remedy —J. W. F., Clovis.

This question was referred to the Southern California Pathological Laboratory at Whittier and Mr. Clayton O. Smith writes:

"From the specimens sent it is not possible to tell what the exact trouble may be. It does not seem to be crown gall or root knot and Professor Quayle says it is not due to insects. The peach twigs did not seem to show any definite trouble that could be recognized. I would suggest that the source of this trouble might be found at the roots."

Milch Goats.

Can I secure milch goats from Cultivator readers?—J. H. R., Yuma.

ORTHO NO. 36
LIME-SULPHUR
SOLUTION

Our solution is so strong that we have had to discard the oak barrels, and to use steel drums. It tests higher than any other solution manufactured in the world: 360 degrees Baume; 15 per cent stronger than any other solution manufactured. Our packages do not leak.

Prices, f. o. b., at any of our distributing points, $10.00 per 50 gallons, in 55 and 110 gallon drums.

California Spray-Chemical Co.
CHEMICAL SPRAYS

Southern California Distributors: WATSONVILLE, CALIFORNIA

Braun Chemical Co., Los Angeles

☞ Distributors in all the principal fruit-growing sections of the West.

Alfalfa.

Which is best variety to plant in sandy loam land in this district? Is the Arabian satisfactory in this hot climate, and where can seed be purchased?—Subscriber. Porterville.

So far as tested there is no variety of alfalfa which has stood up to the ordinary Chilean under all conditions. The Arabian has shown up remarkably well in Imperial Valley, but, we understand, has proved rather short lived. The Turkestan has been tested in your section and where shortage of water or cold winters prevail, it has done rather better than the Chilean, but where conditions are right, we presume the ordinary variety will do as well as any. The Arabian seed is not to be had at the present time, but we doubt not the Department of Agriculture will import quantities of it as it did last year. The distribution last year was made through the different seedhouses in this state about January first.

Turkeys.

Is there a turkey almost as large as the bronze and of a different color?—Subscriber, Laton.

The standard weight for bronze turkeys is 36 pounds for male and 20 pounds for hen; for Narragansetts, male 30, hen 18; Slates, Buffs and blacks, 27 and 18; White Hollands, 26 and 16. These last named doubtless rank next to the bronze in popularity.

Dipping Hogs.

Please inform me as to dips for hogs.—Subscriber.

The dip is to be preferred although some have had excellent results from spraying. Of course, the dip calls for the construction of a vat into which the hogs are driven through a chute. The dip may be purchased of standard quality known to work well. In small quantity this is probably to be preferred. The question is too extended for complete treatment in this department and we would recommend writing for Bulletin 74, B. A. I., Dept. Ag., Washington, D. C.

Green Manure.

Is a green crop plowed under with a dressing of fertilizer an equivalent to barnyard manure (for soil as well as trees and fruit) in case of an orange grove?—Subscriber, Meridian.

As to whether the green crop would be equivalent to a dressing of fertilizer would depend upon the crop; also upon the kind of manure applied and the amount. Unless well irrigated the green crop will depend upon the rains, also upon the temperature during growing time. Cost considered we presume more humus can be added to soil through green crop than through manuring.

Gypsum.

Will it pay to apply gypsum to grain lands for wheat or oats? At what stage of the crop should it be applied and in what quantity?—J. C. C., Modesto.

On some soils the application of gypsum sets free potash and in this way stimulates plant growth. In some cases the benefit has been so pronounced as to appear almost miraculous; 200 or 300 pounds per acre is sufficient though some apply heavier.

Diabrotica.

I send bugs which are eating blossoms and beans, also the leaves of peach trees. What are they?—Subscriber, La Grange.

This query was referred to Mr. E. O. Essig, Horticultural Commissioner of Ventura county and he answers:

"The insect is commonly known as the California Flower Beetle (Diabrotica soror). The larvae are small white grubs which sometimes injure root crops in the gardens, while the adult feeds on a large number of plants. As yet this insect has never been regarded as a real pest in this state and no preventive measures are practical or necessary."

GRAIN MOTH.

A subscriber at Orange recently sent specimens of barley infested with small "fly weevil" also small specimens of moth which is the adult form. These were forwarded to Mr. E. O. Essig, Horticultural Commissioner of Ventura county and he reports:

The Angoumois Grain Moth, (Gelechia cerealella Ol.)

For many years this moth has been a most serious cereal pest in Virginia and nearly all of the Southern states. During the year 1902 the pest became more injurious than ever, spreading to the Northern states and California. Strange that so little has been said of it in this state. It must signify that little damage has been done so far. While this may be the case, it is always well to be on the lookout for such pests and to know them when they do come. The following report taken from the U. S. Dept. of Agriculture Yearbook for 1894, gives an excellent description of the moth, its work, and methods of control in granaries:

"The Augoumois grain moth derives its name from the province of Anguomois, France, where it is said to have been injurious for nearly a century and a half. It probably originated, with the granary weevil, in the Mediterranean region, and possibly in southern Europe. In this country it is familiarly, but incorrectly called the 'fly weevil.'

"The history of this insect in Europe dates back to 1736, when Reaumur found it damaging stored barley in France, but the moth was not described until 1789. In America an account by Col. Lamdon Carter, published in 1771, brought out the fact that injuries from the species began iin North Carolina as early as 1728.

"From the seat of its original introduction this moth, has spread to the neighboring states in the south, where it does incalculable damage, and to the southern portion of the northern states, where it is less injurious. It is occasionally troublesome as far north as Canada, and has been reported as doing serious damage in Australia and India. The work of the writer at the Columbian Exposition would indicate that it has now become cosmopolitan, as it was found there in a majority of the cereal exhibits of the tropical and warmer countries.

"In Europe the favorite food of the Angoumois moth is said to have been barley; in America its chief injury is to corn and wheat, but it infests also all of the other cereals, as well as buckwheat, chickpeas, and, it is said cowpeas. It has been estimated that in six months grain infested by this moth loses 40% in weight and 75% of farinaceous matter. In addition to the loss in weight, the grain is totally unfit for food, and it has been said that bread made from wheat injured by this moth was the cause of an epidemic in certain regions of France infested by this species.

"This insect is a small moth of the family Gelechiidae and resembles somewhat our familiar clothes moths, for which species indeed, it is often mistaken. It is light grayish brown in color, more or less lined and spotted with black, and measures across the expanded fore wing about half an inch. The hind wings are bordered with a long delicate fringe."

"The moth normally deposits its eggs in standing grain, singly or in clusters of from 20 to 30. The eggs are red in color and hatch in from four to seven days, when the minute caterpillars burrow into the kernels and feed on the interior. A single larva inhabits a grain of the smaller cereals. but in maize sustenance is afforded for two or three individuals. In about three weeks' time the caterpillar attains full growth when, without leaving the kernel, it spins a thin silken cocoon in which it transforms o a chrysalis, the moth emerging a few days later, the entire period from egg to adult embracing in summer rom 4 to 5 weeks. After copulation, he moth soon deposits her eggs for another brood, and in this manner several generations of the insect are produced in the course of a year. The lder writers believed that the pecies was normally double-brooded, ut as the insect breeds continuously n the harvested grain, there is now n irregular development which is influenced by temperature. In this titude there are probably five or six enerations annually. Mr. H. E. Weed stimates that in the warmer climate f Mississippi, where the insect can reed uninterruptedly during the inter months, there are at least 8 enerations.

"In some respects the Anguomois rain moth is more troublesome than ny of the other granary insects. ven as far north as central Pennsylvania it lays its eggs on the grain in e field, and it is, therefore, impossible to entirely prevent infestation.

"The custom of leaving the harvested grain in stacks in the field for eeks before thrashing, in vogue in me parts of our country, is the use of perhaps the greatest proportion of the infestations. The introduction of the insect into the granary rough this channel may be practically prevented in the case of the aller cereals by harvesting and rashing as soon as possible after e grain reaches maturity. If, after e removal of the old grain from as, these are thoroughly cleaned d fumigated before the introduction of fresh grain, the chances of injury are reduced to a minimum.

"This, as well as other granary oths is soft, delicate, and easily ushed, and is unable, when buried neath a large mass of grain, to extricate itself; hence storing the grain bulk and stirring, shoveling, or tating by other means is productive of the best results with this insect."

The remedies are:

rbon Bisulfide.

n barns that are reasonably tight d infestation slight, use 1 pound for ery 700 cubic feet of space. In her open barns, with bad infestation use 3 pounds to every 700 cubic t.

drocyanic acid gas.

n tight barns use 2 ounces of cyanide per 100 cubic feet. In open barns uble this amount. Proportions of nide, water, and acid are as follows:

otassium Cyanide.

nide	1 ounce
Acid	1 fluid ounce.
ter	3 fluid ounces

odium Cyanide.

nide	1 ounce
Acid	1½ fluid ounces
ter	2 fluid ounces

The Ornamental Garden

THIS MONTH.

This is the best bulb planting month of the year and the seedsmen are offering a most attractive line of Dutch bulbs. Those in the home garden which have not been taken up may be divided. Amaryllis if not yet started may be taken up and a half dozen bulbs secured in place of each clump. This may possibly lessen the number of flowers the first year but will ultimately result in material increase in stock. Gladiolus taken up earlier and fully ripened off will now start quickly and give midwinter bloom. Humboldt lilies and other natives of our mountain canyons afford opportunity for extending the varieties in our gardens.

Of the annuals, plant stocks, pansies, cineraria and primula. Roses which were dried off earlier and have not yet started growth may be used for making cuttings at this time. Surer results will be obtained, especially in frosty sections, if this is deferred until the wood is ripened again in December and January. Where the ground is moist and the plants may be affected by early frost, it may be well to withhold water, but on the other hand, care must be exercised to keep sufficient supply, for this late in the season there is in most sections no subsoil moisture, so that if water is entirely withheld from the surface delicate plants will surely suffer.

Chrysanthemums are now in their glory and the application of nitrate of soda or any quick acting fertilizer will increase size of bloom.

Those in "frostless" sections who are depending upon poinsettias for Christmas bloom will be wise to watch the cool nights of the latter part of the month and have coverings ready for their favorite flower. The poinsettia will stand absolutely no frost so that protection may be necessary at this time in all sections.

MAKING MOST OF THE PHLOX.

Nearly everyone can grow phlox and have what is regarded as great success, yet few, even among professional gardeners know how to coax the greatest growth and beauty out of this plant.

Hardy phlox can be transplanted at any time, preferably in the fall or early spring, by dividing old clumps, or they can be grown from seeds planted very shallow as soon as they are ripe. When allowed to become dry they are more or less disappointing in germination, so that we may say that division is the best method. If string divisions are taken early in April and planted about fifteen to eighteen inches apart and the tops are pinched back when about four inches high to make them spread and not more than two or three growths are allowed, they will give a very large head of bloom with a maximum of florets. Give clean culture and an occasional dressing of manure or manure-water.

By this method of culture the phlox becomes an exceptional flower when compared with the big clumps that most people allow to grow. To get best results they should be planted new each fall or spring and given plenty of water while in bloom.

When big masses of plants are desired, about one-third of the stems should be pinched back about May first and about three weeks later another third should be pinched back. This will produce a much longer season of blooming than when they are allowed to grow naturally.—Farm World.

FAMILY LIFE OF BIRDS.

The majority of our birds are monogamous, and so far as many of them are concerned the marriage seems to be for life. With touching fidelity the mates stay together in life or death. The nutcrackers and finches, for example, can scarcely be separated for minutes. If one dies there is great grief. If the female dies the male nearly always remains single during the remainder of the season. It sometimes occurs that he will not forsake his dead mate, but sits beside the little corpse until driven away. The females, on the other hand, overcome their grief more easily, and their widowhood rarely lasts long. A case in point where one of a nest of magpies was found dead, evidently from eating from a poisoned fox, but no later than in the afternoon of the same day the widow led a new groom to her home.

PANSIES WANT TO BE PICKED OFTEN.

The pansy is one of the most satisfactory flowers to grow in one's garden. It blooms almost all of the time, if properly cared for and it flowers very soon; often when the plants are not over three inches in height, and the more one picks the more one has. The old rhyme is well carried out in this flower:

"The more you pick and give away,
The more you'll have another day."

If possible select your bed with an eastern exposure and partly shaded. If convenient get leaf mold from the woods, or good, rich earth from under the manure-pile. Be sure it is fine and porous.

Buy your pansy seed from a reliable florist or seedsman and get the best mixture of German pansies. It pays in the end to buy the finest. Plant the seed in rows, rather thickly, as they can be thinned out. Let the rows be a foot apart.

After sowing, water the ground well and spread a width of muslin over to keep the earth from drying out while the seeds are germinating.

When the tiny plants put forth four leaves, thin out and transplant to an equally as fine spot as you selected for the sowing of the seeds. and with plenty of water, and kept free from weeds they will grow luxuriantly.

KITTY'S ARITHMETIC.

Seven sheep were standing
  By the pasture wall.
"Tell me," said the teacher
  To her scholars small,
"One poor sheep was frightened,
  Jumped and ran away;
One from seven—how many
  Wooly sheep would stay?"

Up went Kitty's fingers,
  A farmer's daughter she.
Not so bright at figures
  As she ought to be.
"Please, ma'am?" "Well, then, Kitty,
  Tell us, if you know."
"Please, if one jumped over,
  All the rest would go."

Cows and Heifers

TWO BULLS. TEAM WORK MULES
AT 10 O'CLOCK A. M.

Tuesday, Nov. 15

on the Hardsock Ranch, one and one-half miles south of

THORNTON

on the Santa Ana electric line, one and one-half miles north of Los Alamitos Sugar Factory. Take Santa Ana electric cars to Thornton Station, teams in waiting.

This herd consists of 16 head of fine cows—Jerseys Holsteins, and Durhams, all in fine condition fresh and coming fresh, all young and choice dairy and family cows. The milk from these 16 cows sold to the Los Angeles Creamery Co., netted the owner $297.35 for the month of September. Eight head of fine heifers all of which will be fresh soon. all out of the best cows on the ranch. One Guernsey bull coming two years old, out of cow testing 6.8. One two-year-old thoroughbred Holstein bull. One team work mules.

The owner is retiring from the dairy business and every animal positively must be sold to highest bidder, without reserve. Cows can be seen at the Ranch any time prior to sale. Terms cash. Free lunch at noon.

W. E. SMITH. OWNER.

Mam. Bronze Turkeys

Large bone, long body, full breasted well marked, early maturing stock from the best prize winning Eastern strains. Toms and hens for sale. Prices Right.

GEO. A. SMITH, Corcoran, Cal.

Pure
Alfalfa Seed

Good crops cannot be grown from weak or foul seed. Many fine stands of alfalfa have been ruined by the love vine and dodder that was not removed before sowing.

We have installed an alfalfa seed-cleaning machine that insures absolutely pure seed, and our stock is selected from only strong and healthy fields.

Germain seeds are not always cheapest in price, but you will surely get a dollar's worth for a dollar and be certain of the quality.

Germain SEED & PLANT CO.
LOS ANGELES

BUY SEEDS BY NAME

If you were buying apple trees you would rather pay a reasonable price for named varieties, guaranteed true to name by a nurseryman than to buy unnamed trees just because you could get them cheap. Did you ever think of the fact that this same argument applies to seeds? Branded and guaranteed seeds are the safest and in the end the cheapest. There must be quality in every package, for the maker must make good goods or he can't stay in business. When you buy Lilly's Best Seeds, Northern Grown, you buy seeds that are true to name, pure and of high germination.

Don't take chances. Send for catalog. **CHAS. H. LILLY CO., SEATTLE,** for over a decade the leading Seedsmen of the Northwest. No matter where you buy, ask and insist on Lilly's Seeds, and if your dealer does not sell them write to us and we will supply you. Lilly's "Crop" Book is of great interest to farmers. Free

New High Grade Automobiles
at Prices Lower Than the
Price of Medium Grade Cars

To Prospective Automobile Buyers:

You naturally wish to purchase the highest grade car you can get for your money, and you naturally want a higher grade car than the dealer can afford to sell you for the amount of money you wish to pay—we will meet your views for a short time.

We have a limited stock to dispose of—all high grade—and all prices to meet the needs of moderate priced car buyers.

Whiting, Davis and Westcott Cars
in Two and Five-Passenger Models

These are not shopworn cars, they have never been driven a mile, and are the latest models received.

We have sold the lease of our garage and have not at present the necessary equipment and room at our store to properly handle automobiles, so we offer you the opportunity to buy a car of higher grade than you ever thought of owning and at a price no higher than is charged for a medium grade car.

Call at Newell Mathews Company, 200 North Los Angeles Street, Los Angeles, Cal., or write us, stating whether you wish to buy a one-seat or two-seat car and we will send you full information or have our salesman call.

Newell Mathews Company

General Agriculture

VALUE OF LIME IN AGRICULTURAL PRACTICE.

It has, of course, long been known that the application of lime to most soils leads to increased productiveness, but the value of lime in this connection is not fully appreciated, even at the present time. Its action on the soil is both physical and chemical, and, in addition, it undoubtedly exerts an important direct influence on the growth of the lower organisms, as well as of the agricultural crops. It is not necessary to state in detail here the important action of lime on the physical properties of the soil, as these have been pretty well recognized for some years. One of the most important effects of lime is the neutralization of organic acids as rapidly as these are formed in the soil, by the decomposition of vegetable matter.

Lime, in this connection, has no substitute, and it is particularly efficient for the reason that, although it promptly neutralizes any acids which are formed, it has no decided alkaline reaction.

Lime is known to be an essential plant food, and the average soil is more likely to be deficient in this element than has been formerly believed. It also exerts a very important action in rendering available the potash, phosphoric acid and nitrogen, which would otherwise be beyond the reach of the growing plant. It also forms an important food material for the lower organisms in the soil, and thereby favors the processes of nitrification and other bacterial changes which are extremely beneficial to the growing crop.

In recent years the importance of maintaining a proper balance between the various elements of plant food, including those elements which are generally considered as less essential, is being more extensively recognized, and lime is one of the principal agencies in maintaining this balance between the different elements. Its efficiency in this connection depends both upon its capacity of neutralizing acid radicals with which some of the other elements of plant food are combined, and, also, in preventing an injurious action of some of the other basic elements when present in excess, particularly potash and magnesia.

This statement will perhaps furnish a brief outline of the ways in which lime may be beneficial when applied to agricultural soils.—W. W. Garner, Physiologist, U. S. Department of Agriculture.

AGRICULTURE IN ALASKA.

Would you care to run a truck farm with strawberries selling at $1.25 to $2 a quart, cucumbers $2 to $5 a dozen, celery 50 cents each, tomatoes 50 cents to $1 a pound, and other products at proportionate prices? Or would you prefer general farming, with a few pigs and chickens as a side line, with hay selling at $60 to $100 a ton, hogs 30 cents a pound, young pigs 75 cents a pound, and eggs $2 a dozen?

These prices are received in Alaska under favorable market conditions, but the prospective settler should consider the difficulties and expense of farming as well as the high prices of his products.

Alaska is not generally given much consideration from an agricultural standpoint, and yet, despite the rigorous climate, a large variety of grains, small fruits, and vegetables are being successfully grown. Experiments are being made with tree fruits, but the results thus far have not been very encouraging. The work conducted by the government with grains at the Rampart Experiment Station has been an unqualified success. Varieties of nearly all grains have been found that grow well.

A cattle-breeding station at Kodiak is working to develop the milking qualities of Galloway cattle, as they are the most hardy and best adapted to the climate. It is believed that this will be accomplished. The object will be to furnish hardy, acclimated cattle to settlers in the country at a price not higher than the cost of taking them from the United States. The coast region is well suited to the raising of cattle.

There are several successful farmers in the vicinity of Fairbanks, some of whom are general farmers and others are running market gardens While they are meeting with some failures of parts of their crops by frosts and cold and wet summers, ye they are learning by experience t overcome many of the discouragements of the climate.

The climate shows a wide variation, from 90 degrees Fahrenheit a Rampart, on the Yukon river, i July, with an average for the mont of 63 degrees, to 69 degrees below zero at Fort Egbert, near the Klondike gold fields, in January, with a average for the month of 40 degree below zero. The coast towns ar mild for that region, neither Sitk nor Kodiak reaching zero during 190 while Juneau only reached 5 degree below in January, with a daily mea for the month of 14.15.

CORN SHIPMENTS FROM AFRIC

The shipment in one vessel of 6 400 tons, or 67,000 bags, of corn fro Durban to Mexico in August indicate the extent to which the export maize has increased in South Afric says Vice-Consul George L. Foster Cape Town.

During the first six months of 191 163,780,225 pounds of maize were e ported, valued at $1,654,371, as con pared with 16,222,578 pounds, value at $182,708 in the corresponding p riod of 1909. It is expected that th calendar year 1910 will far surpa any previous year for the export maize from South Africa.

The average price at which mai is being purchased in the princip producing sections of South Africa- the Orange Free State and Transva —is $1.70 per bag of 200 pounds f round yellow and $1.82 to $1.85 p bag for white flat.

In addition to the shipment me tioned some very large cargoes a being sent to England.

PARCELS POST.

They do these things differently England. In London, as the Woma National Daily of St. Louis show the British parcels post system ables a family to make an arran ment with a farmer to send, for instance, a dozen fresh eggs by mail every morning. Boxes are made especially for this purpose and the cost of carrying a dozen eggs from any point in England to the front door of any house in London is five cents in American money. The express companies in this country have prevented the establishment of this system, because they carry these small packages and charge an excessive toll. Now are the packages safe in the hands of the express companies? The writer of this article has had frequent occasion to send packages by express to an eastern city. In almost every case, the package has been opened and the contents ransacked. Whole articles have been stolen from them, not once, but repeatedly, and in one case a sum of money amounting to $25 was abstracted. No redress could be obtained from the express company and the excuse was made that this robbery was a frequent thing and could not be prevented. And yet, the express companies absolutely refuse to allow the government, with its better means of preventing fraud, from establishing a parcels post system. —The Grange.

SESBANIA ACULEATA AS A GREEN MANURE.

Several notes have appeared recently in the Agricultural News, dealing with Sesbania aculeata as a green manure. Several species of Sesbania are used in India as a green dressing for tea; among these, is dhaincha which is S. aculeata. The two species of Sesbania common in Southern India are S. aculeata, and S. aegyptiaca, which is being most successfully used in connection with tea cultivation in the Wynaad. For this crop, it is sown just before the monsoon, and after three or four months, when it is about 4 feet high, it is cut down, and used as a mulch, or is turned into the soil. Mr. Anstead states that the roots of all the species are smothered with nodules in dense masses—more so than in any other plant that he has seen.

As has been suggested before, observations and experiments with the different species of Sesbania in the West Indies would be of much interest, especially in relation to their possible adoption as plants for green dressings.

Baron von Mueller in his "Select Extra Tropical Plants," says that both S. oculeata and S. aegyptiaca are adapted to semiarid or desert regions, which fact itself lends interest to the plant in Southern California, and especially in the citrus fruit belts, where green manuring is certainly a live subject.

PARCELS POST BILL.

The following gives the text of the parcels post bill introduced in the House of Representatives by Congressman Sulzer during the last session. It is entitled, "A bill to reduce postal rates, to improve the postal service, and to increase postal revenues."

"That the common weight limit of the domestic postal service of the United States is hereby increased to eleven pounds, the common limit of the Universal Postal Union, and that in the general business of the post office the one cent an ounce rate on general merchandise—fourth-class mail matter—be, and is hereby, reduced to the third-class rate, one cent for each two ounces or fraction thereof.

"Sec. 2. That the rate on local letters or sealed parcels posted for delivery within the free-delivery services is hereby determined at two cents on parcels up to four ounces, one cent on each additional two ounces; at nondelivery offices, one cent for each two ounces.

"Sec. 3. That all mail matter collected and delivered within the different rural routes of the United States is hereby determined to be in one class, with rate, door to door, between the different houses and places of busines and the postoffice or post offices on each route, as follows: On parcels up to one twenty-fourth of a cubic foot, or one by six by twelve inches in dimensions and up to one pound in weight, one cent; on larger parcels up to one-half a cubic foot, or six by twelve by twelve inches in dimensions and up to eleven pounds in weight, five cents; on larger parcels up to one cubic foot, six by twelve by twenty-four inches in dimensions and up to twenty-five pounds in weight, ten cents. No parcel shall be over six feet in length, and in no case shall a carrier be obliged to transport a load of over five hundred pounds.

"Sec. 4. That on all unregistered prepaid mail matter without declared value an indemnity up to ten dollars shall be paid by the Postoffice Department for such actual loss or damage as may occur through the fault of the postal service, and this without extra charge. Certificates of posting shall be provided on demand. On registered parcels of declared value, and on which the fee for registration, insurance, and postage has been duly prepaid, the Postoffice Department shall pay the full value of any direct loss or damage that may occur through the fault of the postal service. The fees for insurance and registration shall be as follows: For registration and insurance up to fifty dollars, ten cents; for each additional fifty dollars, two cents. No claim for compensation will be admitted if not presented within one year after the parcel is posted."

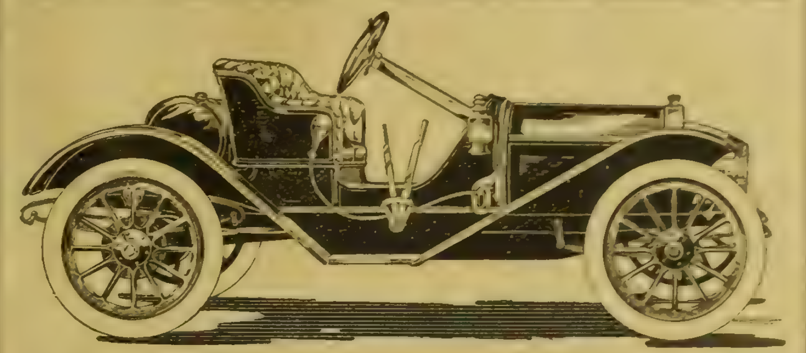
BEAN CROP OF THE STATE.

The bean crop of this state is a big item on the list of products and about one-half are produced in the counties of Superior California. According to a statement in the Bee, the acreage and number of bags is as follows: Superior California counties, 60,500 acres, and 1,025,000 bags; central countries, 19,500 acres, and 280,000 bags; Southern California counties, 62,000 acres, and 1,200,000 bags. The varieties of beans produced are as follows: Lima, 1,100,000 bags; large white, 508,000; small white, 140,000; pink, 439,500; Bayo, 121,250; blackeye, 70,000; other varieties, 124,250.

With an increase of but 1,000 in the acreage, the production of beans in several Superior California counties, including upper Sacramento, has increased from 150,000 bags in 1909 to 175,000 bags for this year. This is an unusually good showing. The figures given are for the number of bags produced in Yolo, Yuba, Sutter, Butte and upper Superior California counties all along the Sacramento river.

A fruit grower at Rosewell, New Mexico, recently shipped a car of apples which netted him $1,000.

THE
Oakland
MOTOR CARS
Made in Pontiac, Mich.— Licensed under Selden Patent



The best value, quality considered at anywhere near the price. A medium priced car with motors equal to those used in many $3,000 cars,–fast, powerful, silent–all the good qualities that a car should have. Scores of satisfied owners in Southern California.
Our traveling man has just written us from San Luis Obispo as follows:
"Arrived here 5 P M today. Had good trip. No trouble with the machine at all and she is a dandy for climbing mountains"
The Oakland is made in 30 and 40 H. P. Roadsters and Touring cars. Decide now to try these cars out before you buy.
Hawley King & Co. Los Angeles
Branch Store 1114-1116 So. Olive St.

RARE PLANTS.

Wild Plant Improvement Gardens, Santa Ana, California. Newton B. Pierce, proprietor. Rare choice ornamentals and new fruits from all lands.

FARM LANDS FOR SALE.

Owens Valley Lands—Those who have written us regarding our lands, we wish to advise that the railroad is now completed and that the cost and time of going into the Valley is greatly reduced. Instead of an expense of $30.00, you can make the round trip, spending two days on our land and seeing the country thoroughly, for a total cost of $19.00, which will be refunded to you in the event you purchase. We urge upon the California farmer, who is considering a change of location, not to waste any time in investigating Owens Valley. The possibilities of this wondrous district are far beyond anything in California. It is not necessary for us to use bumper crops of one successful farmer to tell of the wonderful resources of this Valley. From 250 to 500 bushels of potatoes, from 60 to 90 bushels of corn is the general run. The choicest apple districts of Oregon, Washington or Colorado are not one bit superior to Owens Valley, where you can buy today the very best foothill apple land we have, with a perpetual water right, in steel and concrete mains, at $150 per acre, while the same land in the Northern States would cost you $600. There is no experiment about the Owens Valley as an apple country. The trees have been there for 40 years. Expert apple orchardists from the Rogue River, who examined the land in the Owens Valley this summer, contend that their former home never produced Wine Saps and Spitzenburgs equal to what they saw. The climate in Owens Valley is superior to anything in California, outside of the seashore. The hottest day in nine years was 102 deg. This last summer the thermometer ran to 100 deg. on two occasions. The winters get as low as 10 deg. above, but all farmers contend they work in their shirt sleeves all winter, the cold period only being in the early morning. You should write this office and let us send you an assortment of pictures, maps and complete descriptions. Our printed matter will give you a very complete story of all the conditions in the Valley. The man who lost his opportunity in buying Southern California lands when they were $150 an acre has the same opportunity awaiting him in Owens Valley. If you are in the city, do not fail to call at our office and see the exhibit of apples, corn, onions, potatoes and all grains, which you will acknowledge are superior to anything you believed California could raise. Owens Valley Improvement Co. James R. H. Wagner—H. S. Cook, Sales Agens, Room 13, 329 South Hill St., Los Angeles, Cal.

For Sale—By owner, good farm land, $40 to $75 per acre, in Merced County, 9 miles from Merced and ½ mile from station on S. P. and 4 miles from La Grande on Santa Fe. This land is a rich, sediment soil, situated, in the Artesian Belt and an abundance of water is thus assured. Is level and all under cultivation. No alkali, and is suitable for figs, corn, alfalfa, beans, and all farm crops. Will subdivide in lots from 40 to 800 acres. This land is very cheap at the price. In fact, it is only one-half the price of other land in same locality. For further particulars call or address Paxton, 612 Lankershim Bldg., Los Angeles. Phone A6340.

For Sale—The finest alfalfa ranch in Southern California, 12 miles from Riverside on railroad. Consists of 473 acres of which 378 acres are in a perfect stand of 3-year-old alfalfa. Not a foot of waste land. Two wells, producing 400 inches of water or double the amount required. Complete equipment including 16 head of live stock. This ranch is situated in the heart of one of the richest and most beautiful districts in Southern California. Ideal dairy proposition. Is immense income producer. Selling to settle an estate. For further particulars apply to R. C. Lewis with The Lawrence B. Burck Company, 142 S. Spring St., Los Angeles.

For Quick Sale—Twenty-two-acre orange grove, 11 in Valencias, 11 in Washington Navels and 3 acres in gardens, corrals, etc. 9-room house, 7 miles from Los Angeles on interurban car line. Pays 15 to 20 per cent on investment of $46,000. Trees 20 years old, in perfect condition. Largest crop ever produced now on trees. 50 per cent of Florida crop ruined, making high prices a certainty. $25,000 cash, balance on terms. Rare opportunity to buy a perfect grove. It adjoins one of the prettiest and most thriving foot hill towns, grand mountain view. For particulars apply to R. C. Lewis, with Lawrence B. Burck Company, 142 S. Spring St., Los Angeles.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

For Sale—815 acres in San Luis Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. Forty acres of land suitable for these. Price $21 per acre. For further particulars apply to Mrs. F. A. Clink, Pozo, Cal.

For Sale—5-acre chicken ranch, ¼ mile from Petaluma, 5-room house, brooder house, windmill and tank, all new. Fine well of water, also fine view of surrounding country. Cow, horse, wagon, and 900 laying hens go with place. Net income last year over $1,000. Price $4,500, if taken before the first of January. Call or address A. B. Smith, Bodega Ave., Petaluma, Cal.

Irrigated Land—The famous Gridley Colonies. Improved lands, best homeseekers' proposition in California. Write for particulars. Gridley Land Co., Gridley, Cal.

84 Acres, Highly Improved—15 acres bearing orchard; good improvements, stock, tools, furniture, etc. A bargain at $3,250. Particulars, address W. T. Moore, Cottonwood, Shasta County, Cal.

For Sale—El Cajon Grant Land. Virgin soil, 4 miles to railroad, good farm land at $30 to $60 per acre. S. B. Hawley, 1548 D St., San Diego, Cal.

The Best Buys in farm lands in Central California can be had through us. Call or write Sterling Securities Co., Savings & Loan Bldg., Stockton, Cal.

For Sale—In Sutter County, California, choice fruit and alfalfa farms, 10 to 40 acres. E. L. McCune, Yuba City, Cal.

FARM LANDS FOR SALE.

For Sale—80 acres, rich land with heavy stand of alfalfa, 3½ miles from railroad and growing town, money making dairies adjoining. In natural gas and artesian belt. An excellent opportunity for dairy, hog raising, chickens and turkeys. If necessary, local bank or creamery will furnish money for cows to put onto this piece. Price of $135 per acre includes interest in 4 flowing artesian wells, furnishing plenty of water for irrigation. Terms, one-third cash, balance term of years at 6 per cent. Address S. W. McKee, 2120 West 31st St., Los Angeles. Home phone 71248.

For Sale—The Blackstone Tract of 280 acres in Fresno Co., 14 miles from Fresno, has been subdivided into 20 and 40-acre lots and is now on the market at $125.00 per acre, and is classed with the best lands in San Joaquin Valley. It is all level, no alkali, subirrigated and situated in the center of a dairy and fruit-raising district. Land has had two plowings this year and is now ready for planting to alfalfa, grain, or fruits. Samples of soil sent to Berkeley gave the following: "Your land is suitable for alfalfa, peaches, pears, and Thompson Seedless grapes and grain." I have a good water right with place in 2 companies. For particulars write to Geo. H. Hudson, Conejo, Fresno Co., Cal.

Irrigated Land For Sale, Cheap—In the Lower Rio Grande Valley of South Texas. Ideal climate. Good markets. Large crops. Special inducements to several practical irrigation farmers. Address Manager, American Rio Grande Land & Irrigation Co., Mercedes, Hidalgo County, Texas.

For Sale—240 acres of good land in Mariposa County; 50 acres clear, balance easily cleared; suitable for a hog ranch, grain or apple orchard. Plenty of water; 3 miles of good fences; good buildings. Price $2,200. For further particulars, address C. Gliszinski, Los Angeles, Cal. Gen. Dely.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

POULTRY.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal.

CHEERFUL HOMES.

A cheerful, happy home is the greatest safeguard against temptations for the young. Parents should spare no pains to make home a cheerful spot, says New York "Weekly." There should be pictures to adorn the walls, flowers to cultivate the finer susceptibilities, the choicest and most entertaining of books, and instructive newspapers and magazines. These things, no doubt, cost money, but not a tithe the amount that one of the lesser vices even will cost—vices which are to be acquired away from home, but so seldom there. Then there should be social pleasures—a gathering of young and old around the fireside, a warm welcome of the neighbor who drops in to pass a pleasant hour. There should be music, games, and reading. The tastes of all should be consuled, until each member of the family looks forward to the hour of reunion around the hearth as the brightest one in the twenty-four.—Green's Fruit Grower.

Household Department

A WOMAN'S QUESTION.

Do you know you have asked for the costliest thing
Ever made by the Hand above—
A woman's heart and a woman's life,
And a woman's wonderful love?

Do you know you have asked for this priceless thing
As a child might ask for a toy,
Demanding what others have died to win,
With the reckless dash of a boy?

You have written my lesson of duty out,
Man-like you have questioned me—
Now stand at the bar of my woman's soul
Until I shall question thee.

You require your mutton shall always be hot,
Your socks and your shirts shall be whole;
I require your heart to be true as God's stars
And pure as heaven your soul.

You require a cook for your mutton and beef;
I require a far better thing;
A seamstress you're wanting for stockings and shirts—
I look for a man and a king.

A king for a beautiful realm called home,
And a man that the Maker, God,
Shall look upon as he did the first,
And say, "It is very good."

I am fair and young, but the rose will fade
From my soft, young cheek one day—
Will you love me then, 'mid the falling leaves,
As you did 'mid the bloom of May?

Is your heart an ocean so strong and and deep
I may launch my all on its tide?
A loving woman finds heaven or hell
On the day she is made a bride.

I require all things that are grand and true.
All things that a man should be;
If you give this all, I would stake my life
To be all you demand of me.

If you cannot do this—a laundress and cook
You can hire, with little to pay;
But a woman's heart and a woman's life
Are not to be won that way.
—Lena Lathrop, in Kansas City Star.

IMMORTAL ROSES.

If there was a sufficient sadness about the gaunt old house whose broad railed gallery echoed only the limp steps of the negro Sam, there was a greater pathos in the garden, for here not even a slow footfall invaded the solitude.

Everything about the place breathed neglect—everything, from Sam's shredding shirt to the headless weathercock on the cupola.

But the roses, trailing unchecked over the crumbling walls, seemed to cry it, for in times past were they not the pride of the Runnel garden, bedded, pruned and sprayed, then the choicest blooms gathered each day and carried to the latticed door of the red cottage over the way and presented, with Master George's compliments, to Miss Barbara?

But not so now. No, not since the day that Miss Barbara had bidden her mammy Chloe tell Sam to take the roses back to his master, and to say that he had better send them to Nancy Pierce, since he seemed to care so much for her.

The roses went back to his big house, but not to Miss Nancy. Sam set them in his master's room and tried to tell him gently. But when Sam picked up the bits of the crystal vase he sighed deeply, "Things will be different, I reckon."

Sam was right. Next morning the first post rider brought the news that Miss Nancy and Master George had gone to Beverly; were married.

So things were different, indeed. Although Mistress Runnel came to live at the big house and often walked in the garden, she never, after the first day, looked at the roses, for her young husband had said that he detested roses, and would have Sam dig them up in the spring.

He said the last words in a low voice and when his bride was not looking set his heel on the bud which she had dropped, and looked hard toward the tight-closed shutters of the deserted cottage across the way.

Sam did not dig up the roses. Master George told him to, but before the next spring Mistress Runnel went away. There was something about a Confederate officer; then she died in Paris. Master Runnel went to sea and left Sam all alone in the big house.

One day in June long after that, when the great fluff heads of the roses were drooping pensively under the glare of the sun, a firm tread accompanied by a tap-tap sounded on the flag walk that led from the gate to the garden.

Sam heard them from the arbor house, where he had been dosing fitfully. The steps and the tapping paused now and then as if their owner were standing still here and there; then they started, went straight up to the rose bed and stopped short.

It was a trembling hand that slowly raised a bud to a face framed in gray hair.

When the plushed petals touched the lips of Master George, somewhere a bird called to its mate and the summer wind sighed far away like an echoing sorrow.

The next day and for several days after a great gray veil hung over the sun so that Master George's visits to the garden became one prolonged communion. He had Sam bring a settee from the gallery and one day he picked a beautiful winsome bud and laid it on his knee beside the unopened paper, while he looked and looked—not at the red cottage, with its fast-closed shutters. From the first he had turned his defiant back to the lonely house.

The stillness about the place haunted him. Miss Barbara had gone long ago, on the night after his return from Beverly, and now the Virginia creeper climbed the casement as if shielding its mistress' home from the gazing world, while the shrub and berry vine tangled caressingly over the paths which she had trod.

Word of Miss Barbara's triumphs and adulations had reached the garden, but by that time its master was upon the high seas and the remnant of town folk only shook its head sagely. When in after years it was rumored that she had a world of

"There's very little heat. But try this with an ordinary lamp and see what happens."

LIGHT—NOT HEAT

The Angle Lamp gives less heat than any other method except incandescent electricity. Will *not* scorch or discolor your ceiling, etc. Eliminates possibility of fire. Gives well distributed shadowless light without dangerous and unpleasant heat—delightful to read or work by.

The Angle Lamp

is the simple, economical, convenient and perfectly satisfactory method of burning common kerosene. It *never* smokes or smells whether burned at full height or turned low. *Lighted and extinguished like gas.* Filled like a water bottle. Requires filling about once a week.

The Cheapest Form of Light

Being fully ⅓ to ½ more economical than even the ordinary lamp it soon saves its cost. It is made in 32 varieties. Come in and see it or *write for catalog.*

Oakland's New Engineering College

THIRTEENTH AND MADISON STREETS

Polytechnic College to Have Elegant Building and Equipment

The magnificent new re-enforced concrete engineering building of the Polytechnic College, at 13th and Madison Sts., Oakland, is nearing completion. This new and modern building, together with extensive equipment, will give this college superior facilities in all departments of engineering work. This institution appeals to young men who wish a high-grade course in all the essentials, but who cannot spend four or five years in college.

Contracting and Practical Work

The crowning feature of the Polytechnic College of Engineering is in combining practice with theory. It is, perhaps, the only school in the United States that engages in actual engineering and construction work, and gives its students actual practice while pursuing their courses.

Complete courses in Civil, Electrical, Mining, Mechanical, Hydraulic, Gas and Steam Engineering; also in Architecture.

suitors at her feet, but none was accepted, its aging head nodded significantly.

June melted into autumn and the mist continued to lift and lower over the blazing sun and Master George continued to sit in the garden while the roses swayed and smiled companionably.

Sam had captured the truant branches and culled the ghostly stalks that had long threatened the tender shoots, and now each flower seemed to bloom for the master's praise and touch, each seemed to rival the other in recalling a time long gone.

Into that long-gone time Master George had entered, all unwitting. It was the roses—they had brought lights of tenderness back into his eyes; helped him to forget the broken vase; the mad ride to Beverly and the bitter aftermath.

Now in their midst he was strolling with Barbara. These paths echoed her songs; Barbara in white musline, buoyant and happy; Barbara, with a rose in her hair.

One morning Master George tarried long beside the roses. His face was drawn and ashen, for when he had reached for a tempting bud near the wall his eye caught the white of a curtain that fluttered out of the casement of the red cottage.

Barbara's cottage! He looked intently, misbelieving the wondering eyes. Yet there beside the open window sat Mammy Chloe, red-coifed and sad.

Master George opened his book, but that could not hide the stooping figure of the old colored woman; he started to read aloud, but that could not drown the crooning of her mournful song.

Then the eyes in the garden suddenly dimmed and Master George leaned hard upon his cane as he went toward home.

In his room he sought from the folds of his wallet a rose long withered. Sam found him in the twilight with the flower crushed in his hand.

He went early to the garden next morning, but when he reached the settee Mammy Chloe was gone from her place by the window; the shutters were closed and the cottage had resumed its former aspect of pathetic silence.

He walked the path, stopping now and then to peer through the hedge. "It is early," he argued; "she is resting; she has come a long way." But the sun said noon and after and still the blinds were drawn.

Twilight came, and with it a feeble light streaked through the slanting bars. Master George still sat in the garden. A book lay unread beside him and his head was low bent.

"Barbara!" his lips moved. Could it be that Mammy Chloe had returned to the cottage—alone?

Young men and girls strolled past the iron gate in the leafy distance; he could hear snatches of their gay chatter, and now and then some plaintive chords on a guitar down the street.

The gate hasp lifted, dropped. Somebody was treading the long-disused path. He did not heed nor hear, for back through a vista of exile life again stretched in unending years—years weighted with the wrongdoing of that fitful night—years now bitter, now lonely.

Tears lay in his eyes as he watched the flickering candle light in the cottage window and thought of the garden days just ended. Days so full of thought—days wherein he had grown to know that it was love that had led him home—home to wait for Barbara—but now! O God! Had she gone on to that land of eternal roses? His heart stilled in answer.

Not till the ambling figure stopped near the rosebed did he know. He started, trembling with uncertainty, then with outstretched hands rushed to meet her.

"Tell me—has Barbara—? Where is she?" he could say no more.

The red-coifed head bowed low and in the darkness she pointed in mute appeal to the cottage window.

"She's there, Mars George, most sick an' wearin' her heart out for roses—jes' roses."—Spokesman Review.

TABLE LINEN.

Every woman rejoices in her linens. From the earliest time this was considered the most important part of a girl's dowry and now it is one of the first things purchased for the green box. At present the annual linen and white goods sales are going on and if one can tell a good piece of linen when one sees it, there is an opportunity to get it at a very low price.

The cheaper qualities of table linen, or those woven on an ordinary loom, are termed "table linens," while the more expensive linens appear in many different designs and are termed "damasks." Table linen may be bleached or unbleached and can be had in simple designs. Either will be found to wear better than the cheaper damasks and will launder more satisfactorily. There is very little trouble in bleaching; all that is needed is air free from smoke, plenty of sunshine and green grass. Do not use bleaching materials as most of them injure the fabric.

The Irish linens have always been prized most highly, although there are linens of German, French and American manufacture. Each has its distinguishing characteristics. To obtain linen of good wearing quality choose that which is pliable and yielding and is without sizing. Never buy a mixture of cotton and linen; either all cotton or all linen is more satisfactory than a mixture of the two. Never buy fringed table linens, it is very difficult, if not impossible, to keep them in order. The fringe either tears off or becomes matted and very unsightly. A pattern cloth is always prettier than one bought by the yard, on the other hand it is also more expensive. Avoid a pattern which has an openwork effect as it will not wear well.

All linens should be hemmed by hand. In laundering avoid rubbing them on the board and use no starch unless they are of a very fine quality, and then do not use enough to give a starchy stiffness. A silence cloth used under the linen adds to the length of time it can be used without looking soiled. It also relieves the cloth from friction at the edge of the table.

Great care should be taken in drying linen. If it is put on the line and left to flap in the wind it will soon wear out.—Farmers' Tribune.

Mary had a little skirt
Tied tightly in a bow,
And everywhere that Mary went
She simply couldn't go.

APPLE RECIPES.

Apple Custard.

Pare and slice Watsonville apples to nearly fill a buttered baking pan. Add bits of butter, sugar and flavoring to taste and bake until tender. Have ready boiled custard flavored to taste, with beaten whites of eggs folded in; when cool pour over apples and brown in oven. Serve hot or cold with cream.—M. M.

Apple Marshmallows.

One-half box Knox's gelatine, 2 cups granulated sugar, 3 large Watsonville apples, pared and put through the food-chopper. 1 doz. walnuts chopped in the same manner. A few grains of salt. Soak gelatine in ½ cup cold water. Heat sugar in ½ cup water and to this syrup add the gelatine, letting it stand until partially cooled. Add the salt, nuts and apples. Beat with a whip, and when it becomes too stiff for the whip use a spoon, until it can be spread in pans previously well dusted with confectioners' sugar. Stand it in a cool place until thoroughly chilled; turn out, cut in cubes and roll in confectioners' sugar.—E. P. D.

Apple Meringue.

To hot sauce made from 6 large Watsonville apples add butter size of an egg. When cold add 1 cup fine cracker crumbs, well beaten yolks of 3 eggs, 1 cup sweet milk or cream, salt, sugar and nutmeg to taste. Bake in large plate with rich under crust. When done make a meringue of 3 eggs, ½ cup white sugar and a few drops essence of lemon. Pour over the dish and brown lightly.—J. R.

Apple en Casserole.

Peel and slice Watsonville apples into a large casserole. Add sugar to taste and moisten with cider or water. Cover the casserole and bake several hours until the quantity is reduced by one-half. When cold serve with cream.—C. S. G.

Bellflower Custard.

Two cups well sweetened apple sauce, 1 saltspoon nutmeg or cinnamon, ½ cup seeded raisins boiled for 10 minutes. Yolks of 2 eggs. Mix well and bake with one crust for 15 minutes. Make a meringue of the whites of 2 eggs slightly sweetened, spread over the fruit and brown in oven. Serve cold.—V. R.

Apple Compote.

Peel and quarter any solid apples, such as the Watsonville Newtown, and note the weight of the prepared fruit. Boil in water without sugar until almost tender. Add almost an equal weight of sugar and some lemon juice, and boil quickly until the apples are clear. Remove the fruit and reduce the juice to any desired thickness before pouring it over the apples.—M. E.

Apple Butter.

One quart new cider boiled to one-half the amount, 2 qts. sweet apple sauce. Boil together stirring constantly until dark brown and of a consistency like marmalade. A few minutes before it is done add 1 qt. molasses and flavor with cinnamon and nutmeg.—V. R.

Apple Brown Betty.

Sliced Watsonville apples, 2 cups bread crumbs, 1½ cups sugar, grated rind of 1 lemon and some butter.

Mix together crumbs, sugar and peel. Sprinkle a layer of this in buttered baking dish and dot with bits of butter. Alternate these layers with layers of the sliced apples, making the top layer of crumbs and more butter. Bake in slow oven until jelly-like and clear. Cover while baking as it burns easily. Serve with cream. —A. W.

Surprise Apple Salad.

Use eggs not too freshly laid. Put into cold water and let them cook ten minutes after the water boils. While the egg is still warm remove carefully from the shell and by pressing the ends between the thumb and first finger give it the shape of an apple. Dip it into a yellow liquid made by mixing with water a few drops of Burnett's yellow paste. Then with Burnett's "Fruit red" paste, paint a rosy cheek on one side of the apple. In the smaller or blossom end of the apple insert a clove from which the center has been removed, and in the larger end insert an apple stem. Arrange on crisp lettuce leaves and serve with mayonnaise or French dressing.—G. L. B.

Apple and Celery Salad.

Scoop out the centers of 10 ripe apples. Mix with the chopped apple and an equal quantity of chopped celery with a boiled dressing. Fill and serve on crisp lettuce leaves or curled celery.—L. A. T.

SOME EXCELLENT HOME REMEDIES.

If more young mothers would fortify themselves with good home remedies there would be a great saving of doctors' bills and also of suffering and many of the best remedies we have are easily prepared at home and at almost no expense. A good way to ward off an attack of croup is to put a tablespoonful of alum in a cup, pour boiling water over it and stir until all is dissolved, then add plenty of sugar or honey, and give a teaspoonful of this mixture every hour or half hour as the case requires. For sore throat, moisten a flannel cloth with coal oil and bind around the throat, and if very bad use the oil as a gargle. If there is roughness in the throat or hoarseness, beat the white of an egg to a stiff froth, into this squeeze the juice of a lemon and stir in as much sugar as it will dissolve and take a teaspoonful four or five times a day. For a chronic sore, bathe three times daily with weak suds made of the best castile soap and ten drops of carbolic acid in a basin of warm, soft water, and afterwards apply vaseline. The best way to treat severe bruises where the skin is broken is to bathe them with as hot water as can be borne and dry well with a soft cloth, then dust well with talcum powder, as it is safe to use and it is very healing and soothing to the skin. A case of breaking out on the skin with intolerable itching was greatly relieved and finally cured by rubbing with olive oil and wiping off as much of the grease as possible and then dusting well with this powder, and there is no better powder than this to use for chafing or any kind of breaking out on young children. To cure hiccough give a few drops of essence of peppermint on sugar, and for nausea and headache give a few drops of the peppermint in a little warm water. This will often give immediate relief. It is well to keep on hand a mixture of a tablespoonful each of lard and turpentine, and for a cold in the chest, rub over the lungs and between the shoulders with the mixture and cover with flannel.—Martha.

Common Sense in Canning for Market

Is the name of a

BOOK

that we are going to publish. It tells how to "put up" every kind of fruit or vegetable, in cans or glass jars.

How to can oranges.
How to bottle fruit juices of all kinds.
Why so many unfermented grape juices are insipid.
How to make it equal to best.
Why canned goods spoil after canning!
How to prevent working.
Canned Eggs have been kept fresh, hermetically sealed, for months. Why not now?
And much other valuable information.

Hay.

Receipts of hay for the week have been 4500 tons. The arrivals of hay during the entire month of October amounted to 20,000 tons, as against 12,500 tons that came into San Francisco during the month of October last year, when hay was comparatively high.

The increase in these hay arrivals this year during October is easily accounted for by the fact that large quantities of alfalfa have been brought in for shipments to the north, and large quantities of other feed hay that were being used here to fill orders for shipments along the Coast and for export.

The hay now coming in from the warehouses cannot be sold here, in most cases at prices sufficient to cover the cost of the hay with the warehousing charges added, and therefore purchasing in the country for the present is very limited.

Fancy wheat hay for retailing purposes, is readily sold at our top quotations; the same may be said for fancy tame oat hay but all the other types of hay are slow to move, and the poorer classes are very much neglected.

The market on alfalfa hay is unchanged, although a trifle quiet.

We quote the wholesale prices in round lots on today's market as follows viz.:

Fancy wheat	12.50@13.50
No. 1 wheat or wh and o	10.50@11.50
No. 2 wheat or wh and o	9.00@10.00
Choice tame oat	10.50@11.5[illegible]
Other tame oat	8.00@9.50
Wild oat	8.00@9.00
Stock hay	5.50@6.50
Alfalfa	9.00@12.[illegible]

Deciduous Market

SACRAMENTO, November 5th. 1910.

The following circular of the California Fruit Distributors gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning November 4th, 1910:

Pears: One car.

No pear shipments have been made since October 29th and the movement has now ceased.

Grapes: 170 cars.

Reference to the report of last week will show that there has been a falling off of more than 120 cars during the past seven days. Grape movement is nearly at an end. Very few Tokays are offering and the Emperor is practically the only variety going forward in quantity. Movement will continue through the coming week but in a more limited volume and it is expected that the crop will be entirely cleaned up within the next ten days and possibly earlier.

Weather has remained favorable and while conditions are now somewhat threatening, it is hoped that there will be nothing to interfere with the successful close of the season.

ALMONDS MOVING.

Manager Dargitz, of the California Almond Growers' Association, reports:

The lull in the demand between Thanksgiving and Christmas has, evidently, passed. The Christmas demand is setting in and cars are moving nicely again. We have at present, as far as we can determine, not to exceed 40 cars unsold and the amount is whittling down so that we have every reason for encouragement in the matter of prices holding up. We think that when the trade learns that any variety is nearly exhausted it will hurry up with orders to meet its requirements. We have reached a point where we have to figure on placing orders for shipping out cars at such points as we can get the varieties needed. We are endeavoring to hold an assortment at each place so that we will have to do as little localling to fill up cars toward the end of the shipping season as possible.

We have met with some delay on the shelling end of the proposition but the cash for the shelled goods has been forthcoming promptly as fast as we could deliver.

We meet with vexatious delays

sometimes with the railroads and steamships, which we are not accountable for and can hardly correct, but we are doing the best we can and at all times safeguarding the interests of the growers.

We are now about to enter upon what we believe will be the last month of selling for this season when we expect to clean up our holdings.

Citrus Market

LOS ANGELES, Nov. 9, 1910.

The large receipts of Navels, Porto Ricos and Floridas is affecting the price of the few Valencias remaining in market. They still sell at fair prices and far above Navels, but not at as good prices as formerly. Shipping of Valencias is practically ended, but some are in transit and in various eastern market centers. Navels are being well received, though windfalls and early shipments from Florida are affecting the market somewhat.

Lemons are not so strong, though the market is not discouraging except in comparison with the exceptional prices of a few weeks ago. The auctions are still showing $6.00 and $7.00 sales, therefore lemon growers have no complaint.

Shipments.

Shipments to date this season since the beginning of the New Year, November 1: Oranges, 29 cars and of lemons 79 cars or a total of 108 cars of citrus fruit. To same date last season 88 cars oranges, 47 lemons, or a total of 136 cars.

Yearly Shipments.

Total shipments of citrus fruit for year November 1, 1909, to November 1, 1910, from the entire state aggregated 32,672 cars. Of these 2555 cars were from Central and Northern California. The total for Southern California was 30,117, of which 25,329 were oranges and 4788 were lemons.

The preceding year the total from the state was 40,592 cars, of which 2501 were north of Tehachapi and 38,091 from Southern California. These were divided between oranges and lemons respectively 31,895 and 6196.

The year before that, 1907-1908, the total was about the same as this year, being 32,647,.3150 being from the north and central parts of the state and 29,497, or 24,538 oranges and 4959 lemons, from the south.

NEW YORK Monday, Nov. 7.—Five cars of Valencias and one car of mixed were sold. The lemons in the mixed car met with good demand and, although coming into competition with some of the new crop foreign lemons, realized very good prices. Fancy fruit averaged $6.41 and $6.19, with choice $4.60. The lemons could not be rated as first-class.

The opening sale of Valencias developed a slightly better demand but prices remained practically unchanged. The cold weather now prevailing should increase consumption and stimulate the demand accordingly.

Florida oranges are beginning to arrive more freely. Three cars comprised the offering today. Fancy Parson Browns ranged $2.25 to $3.30, averaging $3.11 $3.03, $2.91, $2.89 and $2.56. Fancy Floridas ranged $2.25 to $2.80, averaging $2.81, $2.75, $2.61, $2.51 and $2.[illegible] and ordinary stock sold $1.15 to $1.50.

Florida grapefruit was dull and inactive—1400 boxes ranging $1.75 to $3.37½. Cuban grapefruit also sluggish, selling $1.75 to $3.05.

CORNING BEEF.

The pieces commonly used for corning are the cheaper cuts of meat, such as the plate, rump, cross-ribs and brisket. The meat should be cut into medium-sized pieces, so that it will pack well in a jar or barrel. It should be well cooled and corned before decay sets in, or it will spoil the brine. For each 100 pounds of meat, weigh out 8 pounds of salt, and sprinkle a layer of about a quarter of an inch in depth over the bottom of the vessel, and then pack in a layer of meat five or six inches in thickness. On top of this put a layer of salt, followed by a layer of meat, until all the meat is packed in the vessel. Keep enough salt for a good layer over the top of the last layer of meat. After this has stood over night, add, for every 100 pounds of meat, 4 pounds of sugar, 2 ounces of baking soda, and 4 ounces of saltpeter, all dissolved in a gallon of warm water. When this is cool, pour it over the meat and add enough cold water to cover the meat. Weight it down with a loose board, held in place by a clean stone, to keep the meat under the brine. It should be left in the brine for from twenty-five to forty days before it is ready for use.—W. H. Tomhave, Minnesota University Farm.

Don't sell the best of the flock because you can catch them easier. Cull with judgment.

FENCE POSTS.

The U. S. Department of Agriculture estimates that the farmers of the single State of Iowa use every year $1,400,000 worth of new fence posts, which cost the equivalent of $600,000 for setting them in the ground. Further, the Department officials believe that a part of this expenditure might be saved.

The opportunity for economy is found, first, in using the kinds of posts which, taking into account both cost and durability, are cheapest in the long run, and second only, by treating the posts to prevent decay, particularly those which decay most quickly. When a farmer sets a post which will have a comparatively short life, he loses not only through having to buy a new post but also because of the additional labor involved in setting it. It is true that in both cases no money outlay may be involved, for he may set the posts himself, after getting them from his own woodlot. Of the posts used last year in Iowa, seventy per cent, it is estimated, were grown on the farms where they were used, or were obtained from other farmers or woodlot owners, and only thirty per cent were bought from lumber dealers. Nevertheless, the farmer is out his labor and the part of the product of his woodlot which is used up, even though he does not pay out any cash. The average life of a fence post is stated to be fourteen years and the average cost 13.7 cents.

If all were determined to play the first violin we should never have a complete orchestra. Therefore, respect every musician in his proper place.—Robert Schumann.

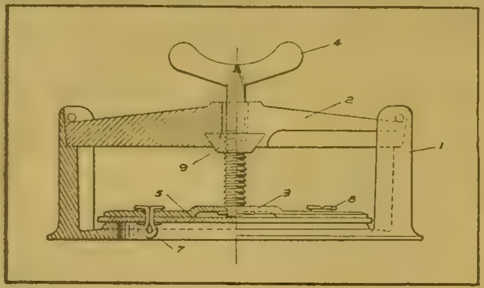
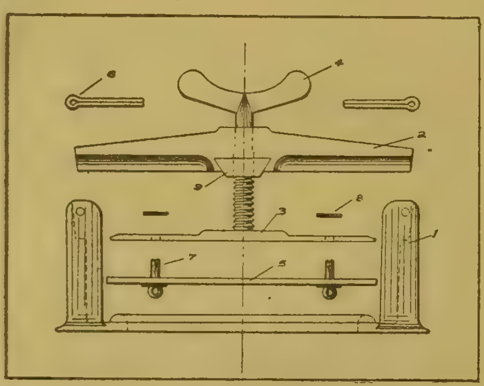
POMONA CIRCULAR VALVE





THE main object of the Pomona Valve is to construct a very cheap and simple valve, and one that requires no special tools or wrenches or experience to operate.

The Pomona Valve is constructed with non-corrosive parts, thus insuring a workable valve regardless of infrequent use. All fastening held in place by cotter pins, thereby making a very cheaply constructed valve and yet a very substantial one.

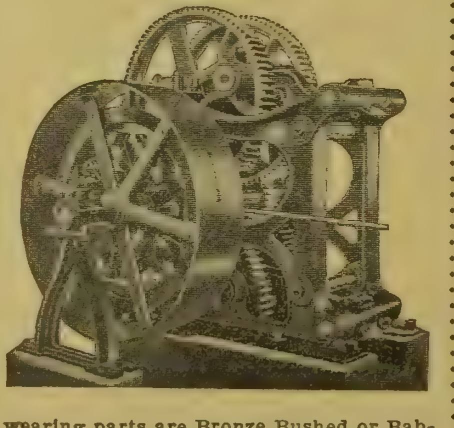
The Smooth Running Pomona Deep Well Pump



RELIABILITY.

Has passed through another most successful season's run, this being the fifth since starting.

There is no experiment in buying a POMONA PUMP. All the parts have been tried out and fully perfected. They will do the work, we know, and do it well.

We have records of plants that have made three seasons' run without one cent for repairs of any kind.

ECONOMY.

May be driven by a steam engine, gas engine or electric motor and in any case will give you the cheapest water and pay dividends on your stock.

Any Water Company going into the Irrigation business will run no chances in buying the POMONA PUMP. They are built heavy and strong. All the wearing parts are Bronze Bushed or Babbited and will last a life-time with the smallest outlay for repairs.

We can refer you to customers who are operating their POMONA PUMPS for less than one-half cent per inch per hour on 200 feet lift. This is less than half what their water costs with other pumps. The same make of engine being used in both cases.

Send for illustrated catalogue to—

Root and Subsoil Conditions as Related to Tree Life

An Address before the Citrus Growers' Convention at Pomona, by Prof. Elmore Chase, of Fairoaks, Sacramento County, California

The orange tree in our land and in our climate is an exotic. May there not be some suggestion towards a solution of some of the problems that confront us by noting the conditions where the tree is indigenous and where it is an exotic? We know that the soil of its home was very rich and very deep and that the trees grew to be centuries old, and from the meager knowledge we have that the period of productiveness was continued with the age of the trees. W. D. Howells in his "Indian Summer" describes the garden as having orange trees hundreds of years of age, laden with fruit. Our inquiry along this line of thought will be confined to subsoil conditions, treating of the root system physiologically, and of the inert subsoil, that is, soils that contain plant foods that are unavailable. This will not include hardpan and such like unfertile material.

Root System.

The root system of the orange tree is notably a great feed getter. It is capable of adapting itself to the work of taking from the soil all the food a vigorous and rapidly growing tree may demand both for wood and for fruit. No root system works more energetically or penetrates with greater persistence through resisting difficulties than does this ancient sour root when budded to a navel orange. When the tree has been planted in a hole made by blasting through hardpan and the root system has taken the food within this cavity and encounters the solid wall, it climbs upward till it reaches the soil above and penetrates this soil in search of food. Sometimes in creeping up the wall of hardpan, it penetrates a crack and in passing through this crevice it flattens itself out and after reaching the soil beyond it assumes its natural shape and keeps at work gathering food. Many instances have been noted where the lower roots of a tree which descend into the ground with an angle and reach the depth where there is excessive moisture, that the lower ends of these roots will die and the living ends near the tree get a diminished supply of food. Immediately at this point, adventitious fibrous roots are sent out. These creep along the dead portions just beneath the bark. These roots are so numerous that the bark is forced open and a temporary supply of food is secured. Every orange grower is familiar with these masses of feeding roots that come so near the surface if the soil is not stirred. This interesting character of the root system emphasizes the importance of deep soil supply of plant food.

Where hardpan is less than two feet from the surface, however rich and fertile the soil may be above, the root system hugs close to the hardpan, reaches out a great distance from the tree and sends up its mass of fibrous feeding roots to the soil above. With proper care such trees will produce an abundance of fruit many years—how many is not easily determined except by actual experiment. It may be laid down as a fact that wherever the root system is repressed by soil conditions such as hardpan, compact gravel and inert soils, and these conditions cannot be overcome, orange growing will be a failure.

There is one feature of the root system which should not be overlooked in this discussion. It may suggest some idea which will help in the solution of this problem. It is well known that the visible roots of the tree, however small, do not directly take the food from the soil. The real organs which take up the food held in solution in the water of the soil, are very minute root hairs. These are co-existent with the foliage. On deciduous trees when the leaf has ceased its function, the root hair also ceases. These root hairs are deciduous with the leaves. In the absence of these the root is no longer capable of taking in food. This is the case with all deciduous trees. They are dormant for a period of time and that time is when the weather conditions are not favorable to the growth of trees. The orange tree is an evergreen and except in the northern climates, never ceases to grow. Its root hairs or feeding organs are always present and active. May it not be that by means of this activity the orange tree may suffer by the vicissitudes of soil and climate? Are they not exposed to dangers which the deciduous tree escapes? May not this difference in the action of the two root systems, the evergreen and the deciduous, suggest methods of treatment which recognize this action of the orange tree?

Sub-Soil.

The principal function of soil is to hold plant food in store for the use of the plant. A fertile soil is a soil that has in it plant food to be supplied to the plant on demand, hence any soil qualified to take plant food on deposit, and hold it subject to the demand of the root system, may be considered fertile soil. It is a rich soil or a poor soil according to the amount of stock it has on hand . An inert soil is a safety vault locked up and the key lost. It cannot receive, deposit or pay out what it may have in its possession.

The question of inert soils in the Sacramento Valley is a new one. It is not strange that these soils so compact, impervious to water, which have lain undisturbed for unknown ages are considered unfertile and of no more use to the tree than so much hardpan. There is no doubt that there are very large areas of such soil quite rich in plant food. This food can be made available by some methods of cultivation and means of fertilization. The investigation of such soils is so recent that but little knowledge has been acquired concerning them, but enough has been done to lead to some suggestions and to create a new interest in soil studies. A brief reference to a few typical cases is all that can be given in this paper.

A ten-acre tract of land with a depression running diagonally through the field is a case in point. The land on both sides slopes gradually towards this depression. On one side the higher portion is underlaid with hardpan or impervious soil. The examination was begun to determine why the trees in the lowest portion were unthrifty, dwarfed and dying. The soil was found to be of good depth and fertile for two feet. Below this was a sub-strata of compact soil which prevented drainage. The ends of the roots of the trees were found to be decayed, such as would be the case with excessive moisture. The examination of these roots showed the sending out of adventitious roots beneath the bark as mentioned above. There was no disease connected with any tree except some slight evidences of gummosis, which however, is not a disease. The following remedy was prescribed. Before the winter rains began, a surface drainage ditch was made through the lowest portion of the hollow for the purpose of draining the surplus winter rains. The trees were to be severely pruned back, a good coat of stable manure plowed in in the spring, and deep cultivation to follow. The summer irrigation was to be moderate and care was to be taken that no more water was allowed on the side hills than could be retained in the soil. The result was that every tree thus treated sent forth during the past season a marvelous growth of wood. The new life given to this half acre of dying orange trees was in no way due to the action of the inert subsoil; but unless this subsoil can be brought into activity, the productive period of all of these trees is limited to a few years.

Another class of subsoils though not wholly inert, owing to its compact nature is of low fertility. The trees were planted with very great care. Very large excavations were made and filled with surface soil. These trees from fifteen to twenty years old, have been yielding moderate returns and are still in a very fair condition, but it is evident they have about reached the limit of profitable orange growing.

Another type of soil quite common in this valley consists of a heavy clayey soil but very rich in plant food seeming well adapted to growing the orange tree, but between this upper soil and a subsoil is a shallow layer of hardpan. This tract was planted twelve years ago and at six years of age the trees, though bearing quite heavily for their size, ceased to show signs of further improvement. After changing owners three or four times, it was bought by the present owner. His thorough cultivation began to make improvement. He found many trees failing to respond and some were dying. They had all been planted in holes blasted out by dynamite. The tap root would go down to subsoil, but the trees as a whole were slow to respond to better culture. The owner dynamited the whole tract between the rows where the hardpan existed and completely broke it up. By adding various fertilizers and by careful cultivation, these trees now twelve years old, are most of them considered large for their age and are bearing a profitable crop of oranges and have been for the last five years. These examples are enough to suggest a very important idea. Unless soil has the depth of two feet or more above hardpan or any unfertile subsoil, citrus culture will not pay for the outlay as well as some other fruit. Hence it is of the greatest importance to all who think of growing citrus fruit for profit to examine thoroughly the condition of the soil even before money is invested in its purchase. If the soil is of good depth and any hardpan or impervious soil beneath this soil is capable of being broken up, then it can be made a good investment. It is the want of capillarity in soils that renders them inert or infertile. In order to bring all soils into first class conditions for the growth of plants of all kinds, we must increase the capillary attraction of the soil to make it porous, capable of receiving and delivering air and water. We have two very efficient agents for producing this result, one mechanical and the other vegetative.

How to Prepare Soil.

First let the land be surveyed and staked for tree planting. Make a plot of the land and then dig the holes for all the trees very wide and very deep, shooting them with dynamite wherever needed till a complete drainage is obtained. Then let the holes be filled with good soil so that the surface when settled shall be even with the adjacent ground. Give this soil, whether hardpan or compact soil, a thorough plowing with dynamite everywhere between the holes. This should be followed by a very deep plowing with a strong team. The irrigation system should then be established and the whole field thoroughly prepared for alfalfa growing. Keep this in alfalfa not less than five years when its root system will be down deep in the ground penetrating the inert soils. Such a preparation for planting will secure at the age of ten years, an orange grove giving larger returns than are generally received from a fifteen year old grove planted in the ordinary way. During the first five years, this field according to F. C. Story, president of the California Fruit Growers Exchange, will be producing the safest of all crops and the most remunerative grown in California. The work of preparing the land after the period of alfalfa will put the soil in prime condition with abundance of fertility sufficient to bring the trees to bearing condiiton. The depth of such a soil will give absolute freedom to the root system and enable the soil to hold and assimilate any amount of fertilizers that the grower may deposit. The trees may be given such a bank account of stock, that we may have good reason to expect a period of undiminished fruitfulness for more than one generation. All our planted orange groves may have this fertile soil brought to activity by degrees, by deeper cultivation not too close to the tree, and by using dynamite freely, and growing during the winter season cover crops which have long roots. Stable manure fertilization along with the deep rotted cover crop, will make rapid progress towards quickening to life activity the compact inert soils in our existing orchards.

Stop *Bruising* Fruit and *Losing* Money.

Every time your clippers pierce an orange's skin you open the way to decay. Usually the cut is too small to *notice*—and the bruised one is crated with the good. *You* know that *one decaying orange may spoil an entire crate*—you lose just that much money. You *won't* bruise fruit if you use

WISS ORANGE CLIPPERS

United States Government Experts and leading citrus growers everywhere endorse Wiss Orange Clippers because they *know by experience* Wiss Clippers *last longest, do best work* and *save money* by *minimizing* the liability of bruising the fruit.

The blades are specially curved and ground—the points and outer edges are smoothened and rounded to avoid bruising. Handles are shaped to prevent tiring of the hand. Wiss Orange Clippers will give years of service — and are unrestrictedly guaranteed to give satisfaction. *For sale by all dealers.*

Wiss Solid Steel *Pruning Shears* will snip a broom handle and cut the most delicate tendrils. All parts are interchangeable and any broken parts can be readily replaced. 9-inch size, $2.25.

J. WISS & SONS CO., 15-33 Littleton Avenue, Newark, N. J.

The Troutman Orchard Heaters

Will Give You Absolute Protection From Frost.

Orchard heating eliminates the one great uncertainty in fruit growing, and is the greatest insurance agency on earth.

The Troutman Heaters are the WORLD'S STANDARD OF EFFICIENCY AND ECONOMY.

They are built on the scientific principle, and give more heat for the oil consumed than any other device.

They save 50 per cent of fuel and labor.

Special Prices Until November 15th.

W. H. FOWLER
415 East 2nd St. Los Angeles

The LaVerne Rotary Cultivator

The principle of Rotary Cultivation, is an entirely new one; the action of the teeth in the soil being different from solid, cut away Discs or ordinary Cultivators. It carries absolutely no soil with it and can be used at a greater depth with less draft than any other cultivator on the market today. The tool, works so close to the ground with no wheels or other attachments to catch limbs or tear off fruit, that it can be used to cultivate under the trees, where ordinary tools do not reach. The manner in which the teeth enter the soil, tends to keep them sharp and one set usually lasts a season.

We guarantee satisfaction in regard to work and quality of construction.

Citrus and Tropical Fruits

BLISTERS.

The story that great damage has been done to the citrus fruits of Tulare county by the lime-sulphur-tobacco spray has gone the rounds of the press and now experts come with denial which seems conclusive. If the spray does no harm and is necessary for protecting the fruit from the thrips, it is unfortunate, to say the least, that it was started.

We have a letter from Mr. J. R. Shoemaker, of Visalia, in which he refers to work in his orchards, three sprayings, next to the largest acreage in the district, with only one orange in orchard complained of as blistered. In addition, Mr. Shoemaker incloses the following report of Entomologist Horton:

An article in the July 1st issue of the Porterville Messenger, headed, "Lime Spray Badly Scales the Oranges," was recently brought to my attention and has caused a good deal of discussion among orange growers, and some little anxiety perhaps among a few.

For the benefit of those who are vitally concerned in the control of the orange thrips, it seems that the facts regarding the particular injury which caused the article referred to above to be written, should be stated.

On July 5th a trip was made to the Sunnyside district, where it was claimed that "a large proportion of fruit hangs on the trees badly blistered. The first orchards visited were those of Mr. Carr and Mr. Hemphill, both thoroughly sprayed with lime-sulphur and tobacco extract according to directions given by the Bureau of Entomology. Mr. Carr's orchard is situated east of the road and extends well up on the hill, where it is well known the temperature is greater than in the lower land west of the road. With the owner and Mr. Smith a careful search was made in the upper portion of this grove, but not a single orange or leaf could be found which showed any sign of "blistering," from whatever cause. Mr. Carr stated that he had seen no injured fruit on the place.

Mr. Hemphill's grove begins a mile or so south of Mr. Carr's and extends from the road west to the canal with a block also between the canal and the railroad track. In one block of perhaps 200 trees, just across from his house and between the road and canal some damaged fruit was found. The amount can easily be estimated, and roughly, would be about 2 per cent, or two oranges in every hundred. A similar condition was found in a young grove about one-quarter mile north of this.

At first glance it would appear that such injury occurring in fruit known to be sprayed must be caused by the spray. But this hasty conclusion was not borne out by the facts.

In the unsprayed orchard adjoining Mr. Hemphill on the north and lying between the two sprayed blocks, where the injury was first found, some of the oranges showed exactly the same injury. No other portions of Mr. Hemphill's grove than those mentioned showed any of this so-called "scalding."

A sprayed grove just across the road from Mr. Hemphill's and further up on the hill was next carefully searched for injured fruit. Not a single orange showing even slight "scalding" could be found. This grove was sprayed by the same men who sprayed Mr. Hemphill's, using the same outfit.

The next grove examined was Dr. Barber's, lying further over on the east slope of the hill. A portion of this grove was sprayed during the hottest days of the month, yet no injured oranges could be found there.

Not a single complaint of any injury that could be attributed to the lime-sulphur spray or to a combination of this spray and great heat has come to my attention from any other part of the orange district.

However, a careful examination was made of foothill groves in the Lindsay district. One of these lying well up on the hill east of Lindsay, the other two in the El Mirador district, all chosen because they are located in high, hot sections and were sprayed on the warmest days. Not a trace of this injury could be found.

Now, just what caused the discoloration and toughening in the rinds of those few oranges at Sunnyside, which has given us this alarm, is very hard to say. But there is good evidence that some other conditions than lime-sulphur and great sun heat must be present.—J. R. Horton, Bureau of Entomology, U. S. Department of Agriculture.

LOUISIANA ORANGE CROP.

This year's Louisiana's orange crop will exceed last year's crop by several thousand boxes, providing weather conditions are favorable, say the big packers and shippers and the transportation people who have been through the groves. Last year the crop was damaged to some extent by the heavy storms, but the total movement was greater than the year before. So far conditions have been favorable. Fully 75 to 80 per cent of the crop is grown in Plaquemines parish along the Mississippi river extending seventy miles from above Happy Jack to Venice, but the industry is gaining ground in other districts, there being several points in Vermillion and Acadia parishes which will ship this year.

The fruit is rapidly maturing and began moving in a small way about October 1.

The crop is estimated at about 325,000 to 350,000 boxes.

The quality of the fruit is said to be excellent and of desirable size. Dealers will make a great effort to give the Creole oranges a wider distribution this year than last.

NITRATE OF SODA.

It would seem profitable to the orchardists to know all sides of the fertilizer material question; therefore I beg to call attention to these facts: that while theoretically, the continued use of nitrate of soda should cause an accumulation of carbonate of soda in the soil, yet there are several factors operating to prevent this from being realized. All plants assimilate some soda, thus withdrawing so much from the soil. Another portion is substituted for potash in its insoluble forms, thus rendering the latter available while in effect eliminating its equivalent of soda from the soil. Still another portion by double decomposition with any sulphate of lime in the soil or that may be added, forms the relatively harmless sulphate of soda and the beneficial carbonate of lime.

As a matter of fact superphosphate of lime is frequently used with nitrate of soda and this contains about four per cent of gypsum,—sulphate of lime.

But even without the operation of these factors, it is so easy for the rancher himself to know positively if the "black" alkali is present by simply applying a little strip of red litmus paper to the wet soil. In view of this fact and the unquestioned profit resulting from the use of nitrate of soda, it would hardly be wise or profitable to curtail its use on this account before any sign of danger is seen.

But even the "white" alkali must not be increased beyond a certain limit. The California University investigators found orange trees apparently thriving in soils containing 18,600 pounds of sulphate of soda in the first four feet, while the figure for lemon trees was 4,480 pounds.

If the rancher should use sufficient water, without regard to soluble salts, these would doubtless be carried down below with efficient mulching.

A simple laboratory process will determine accurately at any time the extent of concentration of these salts in the soils.

The farmer must use every factor of success, and then apply the proper controlling factors, to reach the greatest measure of success.—R. R. Snowden, Chemist and Soil Engineer, Los Angeles.

OWN YOUR PACKING HOUSE.

Most citrus growers of California own individually or through associations, packing houses, but a few do not, and many grape and deciduous growers do not. For such there may be a lesson in the following from Florida Fruit and Produce News:

The associations affiliated with the Florida Citrus Exchange will have soon perfected their plans for handling their fruit the approaching season. In making these plans it is well enough to keep in mind the fact that the successful associations are those who have acquired their own plans, employed their own packing house managers, and run their business independent of any contractors; whereas, those who have had their work done by contractors have had more or less dissatisfaction among their growers. This is a natural consequence. A contractor's interest is in getting the greatest amount of money out of his work. He counts the cost to himself, and if he can save a penny here or another penny elsewhere at the cost of his grade and pack he consults his own interests before he does those of the grower. He is not in touch nor in sympathy with the association and does not see beyond the life of his contract. The growers should own their own packing houses; which should be equipped with modern machinery and under the management of a board of directors which should meet regularly once a week on a given date, at a stated hour. These meetings should be attended regularly in order that the directors may know what is going on, not only in their own packing houses, but in the Sub-Exchange, in the Central Exchange, and in the markets. It is only by pursuing this course that they can avail themselves of the information which is furnished them by the Central and Sub-Exchange, and for which they pay. Some associations have paid the past season to contractors enough money to have paid a large part of the purchase price of a new plant which they might have owned. These profits to contractors are lost to the growers, whereas they might have been a saving to them as an investment in a packing plant. If any association would lay its plans to own its packing house and assess each grower 5c. or 10c. per box, according to the size of the association, they could in two or three years own a plant in which each member of the association would have vested interests. They would in this way feel more closely identified with the organization, and have an interest in pulling together with their neighbors for its support. A grower whose fruit is packed by contract in a rented house may feel that he has no interest in the organization beyond the current season.

These are points that every association should consider well. The Florida Citrus Exchange exerts every effort to secure the highest market price for the fruit furnished it by the associations, but it is impossible for it to make a satisfactory showing to the growers themselves if the expense is too heavy through improper management of association packing houses.

USEFUL BACTERIA.

In their relation to man, bacteria may be said to be both harmful and useful. Our attention has been repeatedly called to the hostile ones, but almost nothing has been said about the immense good we derive from others. In terms of dollars and cents, it would be practically impossible to estimate the value of germ life to the agricultural world. Soil bacteria are largely responsible for the increased fertility which results from resting land, or what is known as fallow cultivation. The complex organic substances found in the soil, together with the green crops and the stable manure which are plowed under, would all remain, for the most part, unchanged and of no use as plant food, were it not for the decomposing action of bacteria. When the soil is supplied with the requisite moisture and the proper temperature, the millions of germs which make this their home utilize the complex substances present for food and incidentally change the composition of this manure and other material so that it becomes available for the use of plants. In this way thousands of pounds of nitrogen are returned to the fields every season, which, without the aid of the soil organisms, would remain locked up forever so far as growing crops are concerned.

Again, there are those bacteria which, both independently and when associated with our leguminous plants, are able to take nitrogen from the air and incorporate it in the soil where it can be of some benefit to vegetation.

Nitrogen is not the only substance with which soil bacteria are concerned, for by their activities many insoluble compounds of potash and phosphoric acid are made soluble so that the feeding roots of plants can utilize them.

Were it not for bacteria and moulds, there could be no such thing

EXCELSIOR TREE SUPPORT
Hooks are made of Flat Steel.
1¼ Inches Wide—6ft. of Wire.

Write us for information especially nice for

Profitable Farming
Intelligent use of our fertilizers will make your farm profitable. Instead of just about breaking even you will see nice fat profits that you can put away for the days when you will want to rest.
For with fertilizers such as we supply, you will get more per acre no matter what the product and of finer quality. Often you can double the farm's production that way. Let us tell you about it.
The Pacific Guano & Fertilizer Co.
310 Sansome St. San Francisco 503 Central Bldg. Los Angeles

as decay, and there would be hundreds of dead plants and animals about us on every side, and it would be only a question of time until there would be no room for the living.

The acetic acid germ is the principal constituent of "mother of vinegar," and it is this germ that we introduce when we add "mother" to hard cider to change the alcohol into acetic acid.

Pure cultures of germs, known as starters, are added to cream now days to give the butter which is made from it a grassy or other desirable flavor.

Many of the fermented beverages, notably the fermented milk drinks, owe their pleasant and peculiar flavors to certain micro-organisms.

All vaccines and antitoxins which are employed in treating different diseases are produced by the use of a virus or pure culture of a specific germ.

Finally, there can be no doubt but that many of the bacteria, which are taken into the stomach with the food, aid very materially in digestion.—Walter G. Sackett, Colorado Agricultural College.

MARSH'S SEEDLESS POMELO (GRAPE FRUIT.)

THE FREEZING OF AN ORANGE.

On the night of December 29th last, when a severe cold wave swept over the south, Civil Engineer Merriweather, an orange grower of Winter Park, Florida, made a series of experiments to determine the effects of the cold on oranges. Through a small hole, made in the rind of an orange hanging upon a tree, he inserted a thermometer, forcing the bulb into the pulp. The rind fitted closely about the stem of the instrument. At periods of an hour he read the thermometer, finding that at 9 o'clock it registered 43 degrees; at 10, 40 deg.; at 11, 37 deg., and at 12, 35 deg. At midnight he suspended another thermometer near the orange, in order to observe the outside temperature as well, and the following results were obtained:

Time	Immersed Bulb	Free Bulb	Time	Immersed Bulb	Free Bulb
12:00	35	12	5:30	26	24
12:30	33	31	6:00	30	23
1:00	32	30	6:30	30	23
1:30	32	29	7:00	30	24
2:00	31	29	7:30	30	25
2:30	30	28	8:00	30	27
3:00	29	27	8:30	30	30
3:30	29	27	9:00	30	32
4:00	28	26	10:00	30	35
4:30	28	26	11:00	32	38
5:00	27	25	12:00	40	40

It is interesting to note that from 5:30 to 6:30, when the temperature of the outside atmosphere was going down, the temperature of the orange was rising, a phenomenon that is very puzzling and difficult to account for.

BETWIXT TWO EVILS.

The Kind Old Gentleman—What's the matter, my little man?

The Little Boy—Boo-ooh; I'm so c-c-c-cold.

The Kind Old Gentleman—Well, why don't you go indoors?

The Little Boy—'Cos muvver says she'll warm me if I does.—The Sketch.

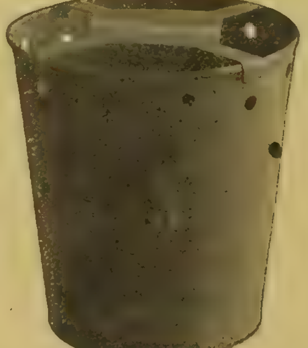
Florida Sour Seed

Put in your orders for Florida sour orange seed before the first of the year and be sure of getting your seed. We are collecting personally our own seed. A deposit of 1-3 required. **Address OTIS E. HYDE, 1314 West 51st St., Los Angeles.**

NO MORE FROST

PROVIDING YOU INSTALL

The Patented Bolton Orchard Heater



We can guarantee to have your oil cisterns built in one week.

We can guarantee immediate delivery on heaters if orders are sent in at once.

WE TOLD the growers in our last advertisement in this paper that we would demonstrate in competition with any other heater, and show the growers that we have the **best heater on the market today.** Our competitors have refused to compete with us, and there must be a reason for it.

Growers, do n't delay sending in your orders at once. It means dollars in your pocket with an outlay of cents. Remember, The California Fruit Growers' Exchange has adopted our heater after investigating all others.

Deciduous Tree-Shrub Fruits

VALENCIA AND DENIA RAISIN CROP.

The raisin season now opened promises to be one of the most abnormal, even in a trade subject to extraordinary vicissitudes. Prices opened at the equivalent of $4.50 per hundredweight for average quality delivered in bulk and unclassified in packing stores, but instead of dropping, as is usually the case after the first few days of speculative excitement, values continued to advance, and at the end of the first week stand at the following high quotations per hundredweight (112 pounds) for ungraded raisins as they come from the drying floors.

Ordinary, $4.86 to $5.04; good quality, $5.13 to $5.40; superior, $5.49 to $6.30. These rates are about $2 above the average initial prices of the last five seasons. Crop estimates for the region continue low, none of the latest exceeding 19,000 tons, against averages of 25,000 to 30,000 tons in recent years, while later advices from Smyrna and the Levant report a crop of Sultanas of only 20,000 tons, against a normal crop of 50,000 tons.

The difficulties, however, of even approximately estimating the size of the raisin crop where no expert or official statistics are available appear to be considerable, and it is interesting to note that several leading merchants are inclined to treat the low-crop estimates with skepticism and reserve. They point out that, notwithstanding the reported damage to last year's Denia raisin crop by rains during the drying period, 7,000 hundredweight more than in 1908 were exported; that the reports of small raisin crops at home and abroad and high opening prices will probably induce muscatel grape growers in the outlying sections of this district, whose fruit ripens later and who usually sell their grapes fresh for table consumption on home markets, to convert the bulk of their crop this season into raisins; that the Sultana crop, estimated last season at 45,000 tons, actually yielded 55,000 for export; that currants, estimated at 145,000 tons, produced the enormous crop of 185,000, or 40,000 tons in excess of estimates; that the consumption of Denia raisins in the largest consuming centers, London and Liverpool, has not increased in twenty years. Finally, they say that prices current at Denia up to the present are purely speculative or nominal, as no orders have been booked at such rates and no exports realized, and that Canadian importers to whom offers of superior grades were made from Denia at 27 shillings ($6.57) c. i. f. declined to speculate, alleging that the finest seedless California raisins could be purchased for less money on Canadian markets.

At the beginning of the present season there remained unsold at London about 6,400 tons Sultanas, old stocks from previous crop, which would only require to be supplemented by 1,000 tons from the new crop to supply the total average yearly consumption of 7,000 to 8,000 tons Sultana raisins on that market. The same line of argument applies equally to Liverpool, where important stocks of Sultanas remained on speculators' hands at the close of last season. Prices at Denia, according to latest advices, show a marked downward tendency, and it is evident that no orders could be obtained from any foreign markets at the rates quoted above, but, on the other hand, growers who are not in immediate need of money, and can hold their crop will not sell at present at less money, as they are convinced of the extreme shortness of raisin crops everywhere in Europe.—Consular Reports.

GREAT PLANT GARDEN

Chico has been favored the past day or so by a visit from David Fairchild, who is in charge of the foreign seed and plant introduction for the United States, and therefore the superior officer who directs in a general way what shall be done at the National Plant Introduction Garden near Chico.

Mr. Fairchild has been connected with this department for many years and has therefore had an opportunity to realize in results of importance to the nation the immense value of the work. He planned to visit the Garden this year when P. H. Dorset was here, so that they might go over together that which had been accomplished and plan for the future. Together they have visited every nook and corner of the garden, noted the condition of the innumerable plants which have been gathered from practically all parts of the world, and found in quite a number evidence of value.

That Mr. Fairchild is not only satisfied, but delighted, with the progress made at the National Garden here with the limited amount of funds available, was quite evident in the course of an interview with a Record representative yesterday; but he, as other men who give their life to working out problems of plant life which require years to prove, is only an enthusiast in thought and action, and not in words. When a foreign plant has been introduced giving promise of value, it is his plan to assign it to the garden, there to be propagated and tested, and generally distributed to persons known to have the ability and inclination for further developing it.

In the course of an interesting interview with Mr. Fairchild yesterday, he told of two plants which had been imported and cared for at the local garden, and which give promise of becoming profitable plants for cultivation in this country. One is the jujube, a tree extensively cultivated in China and which bears a fruit which very much resembles the date. This was imported in 1905, and at the Chico garden has been brought into bearing. Mr. Fairchild has great hope that this will prove to be a success in this country, affording a profitable crop and an important adjunct to the present food supply. The fruit preserved is slightly less sweet than the date, which is not a disadvantage, and the flavor is as pleasant as that of the date.

Another plant to which Mr. Fairchild called attention, simply by way of illustration of the work that is being prosecuted, is the carob, grown extensively in the Mediterranean district, principally as a fodder plant. Its fruitage is imported quite exten-

TRIANGLE TRIP OVER THE
Northwestern Pacific Railroad
One of the most delightful scenic
One-day jaunts in America.
150 miles of Mountain and Redwood Forest Scenery, a Boat Ride on San Francisco Bay and by rail along the Russian River.

Leave San Francisco 7:45 A. M. daily except Sunday, and 8:45 A. M. Sunday only, by boat across the Bay of San Francisco, in full view of the Golden Gate to Sausalito (the Sorrento of America). Thence via picturesque San Rafael and thriving Petaluma (home of the chicken industry), through Sonoma Valley to Santa Rosa and Fulton. From Fulton, through magnificent mountain scenery and redwood forests and along Russian River, to Monte Rio. Return is made along the coast, passing Tomales Bay, Point Reyes, San Anselmo, etc., to Sausalito, arriving at San Francisco 6:35 P. M. daily except Sunday, and 7:05 P. M. Sunday only, the same evening.

If preferred, trip can be reversed, leaving San Francisco at 8:15 A. M. via the coast to Monte Rio and returning along the river and through the valleys, arriving at San Francisco 6:35 P. M. daily except Sunday, and 7:35 P. M. Sunday, the same evening.

Round Trip Fare for Triangle Trip $2.80, except on Fridays or Saturdays, it is $2.50 and on Sundays only $2.20.
Tickets on sale 874 Market St., (Flood Bldg.) and Sausalito Ferry Ticket Office.

sively, and by some it is claimed that as a fodder it will excel alfalfa. It is a tree which grows, under favorable conditions, to a height of from thirty to forty feet and bears heavily of a long pod, which, when ripe, may be knocked from the tree with bamboo stocks. The pods are very rich in sugar, the percentage of sugar running sometimes as high as 40 per cent. This is the principal export of the Island of Cyprus.

Reference was made to these importations only for the purpose of illustrating the real purpose of the National Plant Introduction Garden, for essentially the garden is not an experiment station, but one for the reception and care of promising plants.

Mr. Fairchild emphasized another important point in connection with his work, viz., that while the department of plant industry is prepared to find and import plants from every civilized country in the world, much of the valuable experimentation work is done by individuals not connected with the government, but who take delight in plant-life experimentation. The purpose of the government is to add to the nation's resources by finding profitable plants.—Chico Record.

MICROORGANISMS IN SOIL.

We note in a paper published in Ireland what is there characterized as "the most important discovery of the age" as to soil culture. From it we quote:

"At the meeting of the British Association last week was announced the most important discovery on the knowledge of soils which had been made since the famous one of the fixation of nitrogen was found out some fifty years ago.

"In the Agricultural Section Dr. E. J. Russell described the result of extensive investigations made by himself and Dr. H. B. Hutchinson at the experimental farm at Rothamstead on the part played by microorganisms other than bacteria in determining soil fertility. He explained that bacteria are producers of plant food in the soil, that anything which increases their activity increases the fertility of the soil, and anything which limits their activity limits the productiveness of the soil. He had found that partial sterilization of soil by heat, or treatment with volatile antiseptics such as toluene, led to a notable increase in productiveness. Shortly after the treatment had ceased there was a great increase in the rate at which plant food was formed by bacteria and in the rate of multiplication of the bacteria. This increased activity was not brought about by any heightened vigor in the bacterial stock. On the contrary, it was shown that these organisms were actually weakened by the treatment. It follows, then, that the environment had been improved. When some of the original untreated soil or an aqueous extract of the soil was added to the partially sterilized soil there was at first a still greater increase in the bacterial activity. This had been traced to the addition of the more vigorous organisms of the untreated soil. Later on there was evidence that a detrimental effect was produced where soil was added, but not from the extract. It appeared, then, that the untreated soil contained some injurious factor not washed out by water, which only slowly makes itself felt when introduced into a clean soil. This factor was put out of action by any poisonous organic vapor, by heating to fifty-two degrees, and similar means. It was difficult to account for the experimental results in any other way except by supposing that soil contained organisms capable of checking bacterial development. Such organisms must be larger than bacteria and not readily detached from the soil, since they do not appear, or not to any extent, in an aqueous extract. Search for large organisms has revealed the presence in every soil so far examined of amoebae or amoebid organisms of colopoda and other protozoa. It was shown that the mixed culture growing in hay infusion was capable of destroying bacteria. It had not yet, however, been possible to ascertain definitely whether these protozoa were active in the soil, although the conditions obtaining in atmosphere saturated with water vapor and a film of water around the particles of soil would seem to be favorable to their development. The direct evidence of the existence of these injurious organisms was not complete. It ought to be possible to put some soil under a microscope and see them, but at present they had been unable to overcome the difficulties of working with an opaque substance like soil under the microscope, but the indirect evidence was sufficiently good to warrant the assumption as a working hypothesis that we had in our untreated soil some large organism capable of keeping in check the bacteria, and so reducing the productiveness of the soil. The term he had used of organism had been used for convenience. Whether it occurred in active form or in the form of something analogous to spores they had no direct evidence."

EACH APPLE BRANDED.

Brilliant in design as their fruits are in beauty, Hood River apple growers have come forward with another novelty that will attract world-wide attention. They are sending out some of their choicest apples with the names of the purchasers painted on them by the master artist, the sun. One dealer has made a contract with the Waldorf Astoria hotel and cafe in New York to supply all of the apples used on the tables and to have every apple bear the name of the famous hostelry imprinted on its side. For this purpose a light aluminum band stenciled with the name of the hotel is furnished the grower. After the apples reach maturity and before they begin to ripen the band is slipped over them as they hang on the trees. The sun reddens all of the surface except the portion covered by the lace-like metal band. When it is removed at packing time the hotel's name is painted in golden-green letters on a deep-red background. The method also insures every apple being exactly the same size. The grower receives 8 cents each for the apples in the orchard. The consumer at the Waldorf pays about 40 cents each. Another dealer has a similar contract with a famous Paris cafe, which furnishes stencils of artistic and elaborate design, and which read in condensed French, "Exclusively grown," etc. The novelty of the thing promises to fully repay all interested for the expense and trouble incurred.—National Horticulturist.

One planter at Indio is planning to put out about 20 acres of date palms next spring.

Garden and Field Crops

THIS MONTH.

Strawberry plants which have been rooted early enough may be transplanted, taking care to have ground thoroughly irrigated before and after planting. We have seen strawberry plants set in dry soil, water to follow after planting and of course immediately. However, the time elapsing before the roots are thoroughly soaked is often sufficient for the vitality to be lost.

Onions may be planted, especially for market, Silver Skin and Australian Browns. Late celery, cabbage, cauliflower, parsnips, turnips, salsify, beets, radishes, horse radish, rhubarb roots, may all be planted and add much to the midwinter vegetables.

A heavy dressing of stable manure may be applied to parts of the garden which will be used for January and February planting. If this is plowed under or spaded in deeply it will put the soil in fine condition and besides aid in holding winter rains.

Continue to gather rubbish and burn or compost for applying on orchard or other parts of the place rather than putting it back on the garden.

FEEDING GARDEN SOIL.

A variety of plants with a variety of plant food requirements are grown in the garden. To meet the growing needs of all these different plants many different kinds of fertilizers must be used on the garden soil. The garden gives large yields in proportion to the area cultivated, and no labor and means should be spared to make it yield abundantly.

We like to begin to fertilize our garden soil early in the winter, in fact, just as soon as the crops are harvested in the late summer and fall. Small amounts of trash and manure accumulate about the buildings and grounds. These amounts when raked up and collected are too small to pay for hitching up to the wagon and hauling to the fields, hence we use the shovel and wheelbarrow and get this stuff on the garden as fast as it is formed. The ashes from our wood stoves are removed at frequent intervals and placed about the base of the grapevines, bush fruits and larger fruit trees. The winter and spring rains leach out the easily soluble potash and other mineral elements of the ashes and carry them to the roots of the fruit trees, bushes and vines for early feeding when spring growth begins. Wash water and other soapy slops are poured on the vegetable garden, the small fruit patch, and on the flower beds. It is true these slops do not contain large amounts of fertilizing elements, but they must be disposed of in some way and it is better to save them for fertilizing food and flower crops than to throw them out in the back yard anywhere or allow them to run away through the underground drain pipe. The dirt and waste about the dwelling can be utilized in the garden soil better than in any other way, and in a few years the fertilization amounts to considerable.

About twice each week the cow lot is cleaned with the rake and shovel and the scrapings, amounting to some half dozen wheelbarrow loads, are removed to the garden and dumped in piles. By spring gardening time these small piles are decomposed and in a fine condition for working into the soil either for the vegetables or for the flower beds. Cow manure is mild and safe to use with the tenderest of plants, as very little heat is given off in decomposition. That which has remained in small heaps over winter in the garden works up in spring as fine as the finest garden loam, and is one of the best all round garden fertilizers tnat can be used.

The droppings from the poultry houses are cleaned out regularly during the winter and either applied direct to the garden soil, or they are mixed with stable manure and applied with it. Poultry manure is very strong and hence should be applied thinly over the surface. A little of it will go a long way. Where coal ashes or other similar absorbing material is used with the droppings there is less danger of over fertilizing the soil with them. The ashes absorb and hold fertilizing elements and when they are worked into the soil they give up these fertilizers as plant foods and at the same time improve the texture of the soil, making it light, friable, and very easy to work. Absorbing material should always be used with poultry droppings, since it makes the poultry house more sanitary and almost doubles the value of the manure.

Where not enough refuse about the home can be secured to properly fertilize the garden during the winter, we use manure from any of the animal stables. In spring all the coarsest portion is raked from the garden and hauled to the fields.

SOIL AND FERTILIZERS FOR ONIONS.

In the past, and even at the present time, most of the domestic onions that supply the markets of the large cities of this country are grown on what is known as muck soil, in most cases land reclaimed by draining swamps. This muck soil consists mostly of organic matter and is usually rich in nitrogen, so much so that the onion grower on these soils uses a fertilizer very low in nitrogen, usually a brand varying from 0 to 2 per cent, and having 5 to 10 per cent phosphoric acid and 5 to 10 per cent of potash, with very good results.

Most market growers grow the onion on upland soils, varying from sandy loam to clay, and, while they have to manure or fertilize more heavily than their brother grower on muck soil, they also produce a better quality onion for their customers. It is well known that quality in a vegetable is so variable owing to environment and climatic conditions as to leave the matter open for discussion. Yet I do not think any one will deny that a good clay loam will produce a better quality, a harder and a better keeping onion that one grown on muck soil. All of this should tend to the grower receiving a better price for the better quality onion.

As to the use of fertilizers no hard and fast rule can be laid down. A study of soil and fertilizer, for the improvement of the crops, as well as increased yields, will well repay the grower for his series of experiments.—Market Growers Journal.

Grower of Strawberry Plants only, and only the best.

The Development of an Empire

Wonderful Resources of the Great Valley. Description of Photographs on Cover Page.

The story of a contest of seventeen ranch owners in Glenn and Colusa counties for a highly-bred Holstein cow offered by the Sacramento Valley Irrigation Company was given in a recent Cultivator. It told how the ranches ranging in size from seven to 250 acres were inspected and the winner declared to be the little seven-acre ranch of Mr. Burt. That story had much of intense interest and it is with much pleasure that we offer on the cover page this issue photos showing scenes in the fields of this great empire.

It is an agricultural empire in size and in the range of products—one hundred and twenty-five thousand acres on part of which are now produced oranges, olives, figs, all kinds of fruits, all kinds of agricultural products. The great need is for men, men with a little capital and much ability for work. In this it is typical of other great stretches in the Sacramento Valley.

It was the writer's privilege to take a look on a beautiful October morning at the rice field shown in the bottom photo on the cover. It is not a big field, not as extensive as might be imagined from the photo, but it may be of great extent in results. This field has grown rice of excellent quality, but the future of the crop in that valley cannot be predicted. Abundance of water is a factor in its production. This field is just in the outskirts of Willows, county seat of Glenn county.

The pasture scene in which the Holsteins are luxurating in the rich pasture under the live oaks is some miles from the scene of the lower one; it is down the valley near the Sacramento river. This is one of the herds of the syndicate which is financing this great project. In fact this herd is one evidence of intelligent work being done by the company developing these lands. Only the best of stock is introduced by it and every inducement is offered the settler to breed only highest strains. The Holstein seems to be the favorite breed although Mr. Leonard at Jacinto has a magnificent herd of Jerseys and he and Mr. Guilford, in charge of the development company's agricultural work, have many a scrap over the merits of these two magnificent breeds.

By the way, speaking of Mr. Guilford reminds us of another feature of the work of this company in that these and other expert agriculturists are secured to give aid to those who are developing these rich acres. Mr. Guilford comes to the Sacramento Valley with wide experience in agricultural colleges and practical farm work. His services are at the command of all farmers who have bought lands of the company and to him is due much of the credit for the results shown in the recent contest. This company is following the same plan that the Kuhn Syndicate followed on its Twin Falls subdivision in Southern Idaho. There thousands of Eastern people were placed upon rich acres and happy homes have been made on what was practically desert land. This Sacramento Valley land has been under cultivation for many years but on the extensive plan. The results of the recent contest in which the little seven-acre ranch proved winner will show, it is to be hoped, the greater advantage of intensive cultivation, and instead of great stretches of land given over to grain growing, hundreds of homes will be erected.

The next picture above gives a view of one of the alfalfa fields of the company. This is the seventh cutting of the season and the farmer will quickly recognize the richness of land which places haycocks as close together as are these.

The top picture shows another herd of Holsteins. This showing of the dairying possibilities of this portion of the Sacramento Valley proves the wealth which will be brought to that section. Never yet has there been a dairy country but it was a rich country and continually grew richer.

This will not be a serial story, but we have in hand a number of other photographs which will prove very interesting as showing the productive possibilities of the Sacamento Valley. Some of these will appear in a later Cultivator.

ROOT CROPS.

The culture of root crops for succulent green feed is discussed by E. J. Delwiche in Circular of Information 16 of the Wisconsin Experiment Station. He states the essentials of root culture as follows:

Root crops are valuable for stock feeding, both for their content of digestible nutrients and in supplying succulent feed for the winter months. Under good conditions a large amount of feed per acre can be grown from roots; for this reason they are useful on small farms where the amount of land under cultivation is small.

Roots do best on loam soil, but may be grown successfully on either light or heavy soil, providing the ground is properly fertilized and prepared. Thorough preparation of the soil and an abundant supply of available plant food are necessary for good returns.

Mangels give the heaviest yield per acre, with Rutabagas and Turnips a close second, and Carrots third.

Carrots and Rutababas are about equal in per cent of digestible nutrients, and are higher in this respect than either Mangels or Turnips.

The Mammoth Long Red and Giant Feeding Mangels, the Monarch Rutabaga, and Mastodon Carrot are provisionally recommended as good varieties to plant.

Mangels and Carrots should be planted fairly early, Rutabagas and Turnips somewhat later in the season.

Root crops may be planted in rows eighteen to twenty-four inches apart when cultivated with hand machines, but at not less than thirty inches when a horse cultivator is to be used. Seed should be used liberally in order to insure a good stand. Thinning should be attended to promptly, leaving single plants from eight to ten inches apart, depending on distance between rows and kind of roots grown.

Thorough, yet shallow, cultivation should be practiced throughout the growing season.

Ridging at planting time is helpful on wet or heavy soils.

Roots can probably be grown for less than $2 per ton under good conditions.

The cost of production per acre is approximately $35 per acre.

A consignment of 1800 pounds of seeds from pines and cedars of the San Jacinto Mountains was recently received at the Lytle Creek Nursery near San Bernardino.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

FALL WORK.

By Mrs. M. E. Sherman.

The land is full of the developed maturity of tree and vine and there is a distinct pause, a rest and a softening of autumnal coloring after the strenuous summer time of growth. The golden autumn tones beautify and enrich even the straggling weeds with a magic touch. The birds are quiet except for gossiping chirps, as their season of nesting has passed. The hawk's raucous call in the day time and the coyote's yelp in the night are all that one hears of the wild things on the ranch. The fragrant odor of fresh cut corn and alfalfa mingles with the perfumes of ripe grapes and falling leaves.

Silage.

The soft coughing of the gas engine and the whirring of the cutter as the corn and alfalfa are being rapidly put into the silo fall pleasantly on the ear of the farmer. The cattle stand bunched at the fences, attracted by sight and smell of the green stuff, waiting with drooling mouths until at last a loaded wagon turns into the corral and the feeding racks are filled. Animals are very like human beings in their actions. Some of the younger cows push ahead of the horses, blocking the road in their eagerness to be first. A few snatch mouthfuls as they pass the wagon. Placid Juliana, Cresenta and Ideala remain standing quietly waiting until the rush is over. They have gained the calmness of maturity and trust providence that there will be enough for all. If there is not enough, then it is still better to go without than lose the blessed tranquility and become one of a trampling crowd.

Every year the value of silage increases in our estimation, and when the silo is once full we feel rich in feed. The happiness of the cows is equalled by our contentment when the silage is in the racks in abundance. Alfalfa silage does not give as much of a variety to the food as when we have corn in the silo and alfalfa hay in the racks, yet it is not hard to supply the missing carbo-hydrates by a little rolled barley in the mangers. Usually we have made the corn silage first and then topped the silos with alfalfa. This year we are returning to the way we made the silage at first, mixing the corn in with the alfalfa as it happens to be convenient. The haul from the alfalfa field is a little too long to keep the cutter running steadily if the alfalfa is filled in alone, so we are running the corn in whenever there is a lull in the alfalfa. Whether this mixing will add to the palatableness of the mass the cows will soon let us know by the eagerness with which they clean up their mangers.

The use of silage always improves the thrifty appearance of the cattle as it is full of juices and keeps their skins mellow and soft. While it is feeding water, it is feeding it in the same way that we human beings take in water in fruit and in green vegetables. Alfalfa silage is certainly a great milk producer and should be credited with the results of greatly increasing the milk yield. Each cow is allowed sixty pounds a day when on silage alone—it takes this amount to cover wastes in handling and the portion the cows may wish to eject. It is convenient to feed the cows by allowing that amount to each one and then adding thirty pounds for each heifer. After the evening milking the cows remain in the corral at the barn to eat hay, while the heifers are turned into the silage feeding corral to clean up the silage left by the cows. When the silage is eaten up clean each time, then the right amount has been reached to feed. The cows receive the first choice and the sharper appetites of the heifers clean up the remaining portions without loss.

Value of Corn and Alfalfa.

The need of improving corn in California is great. After buying the best seed I could obtain and carefully selecting the seed ears for the past three years, they still are not extra good, as compared to the standard ears that Dr. Shaw had on the demonstration train. The cost of the corn crop on the ranch this year has been as follows, by the acre: Cleaning the field of stubble by burning it off, twenty cents; one irrigation before plowing, twenty-five cents; plowing with four horses deeply, eighty cents an acre; harrowing, thirty cents; planting, forty cents; seed corn, fifty cents; cultivating, thirty cents; irrigation, forty cents; cultivation, thirty cents; partial irrigation, twenty cents; cultivation, thirty cents; rent of acre of land, six dollars (this includes taxes and irrigation water); wear on tools, fifty cents; a total of nine dollars and twenty-five cents an acre. The crop averages fifteen tons to the acre. The expenses of making silage, cutting by mower, fifty cents; cutting the corn blown over by hand, one dollar, an average price of seventy-five cents an acre will probably more than cover the total expense. Hauling in and putting it into silo is about fifty cents a ton. This is, of course, if the engine does not balk. The price of the work is not prohibitory to any one.

Alfalfa silage costs us somewhat more, as we have to buy it at a distance from home and haul it ourselves. In buying it in the shocks green in the field we pay at the rate of three to one. That is we pay the selling price of one ton of hay for each three of alfalfa. The cost of hauling amounts to sixty cents a ton and it costs about thirty-five cents to put it through the machine. This cost includes the unloading at the cutter. When there is alfalfa alone at hand the cost of the two should not differ greatly in the handling of the silo. The tonnage, however, of corn to the acre is greater than alfalfa. The crop of fifteen tons to the acre is rather lighter than the usual crops we raise. The intense heat of the past summer cut down the growth of the corn by hastening it into tasselling. Then at this critical time the water failed in the canals and

Clip Your Horses

with this superb Stewart No. 1 Ball Bearing Clipping Machine

The great enclosed gear machine at your dealers all complete, as shown,

only $8.50

No machine ever made at any price equals this one. It is the most perfect in every way of all clipping machines on the market.

It turns easier, clips faster and lasts longer. If you have but one or two horses it will pay you to have this splendid machine.

The gears are all cut right out of the solid bar, and all wearing parts are file-hard. It will last a lifetime.

If your dealer hasn't it, write us direct. GET ONE NOW

KEEN KUTTER
Tool Cabinets

A boxful of tools—good tools—just the kind you would select were you an expert carpenter or cabinet maker. That's what you get when you buy a Keen Kutter Tool Cabinet. In fact these are the only tool cabinets made containing a complete set of tools under one trade mark and guarantee, and it's a real guarantee—a fair and square guarantee—one that refunds your money if you are not fully satisfied.

Every tool has a place of its own and it's there for service. Whatever the tool—however hard the work—you won't be disappointed.

Keen Kutter Tool Cabinets are made in many different sizes, the prices varying with the number and kinds of tools selected. There's the $8.50 size containing enough tools for any ordinary job, several between this and $50.00 and one at $125.00, which includes work-bench, vises, etc.

the corn had to come through by cultivation alone to its ripening. If the water had held out the corn would have been at least two feet taller. There is a further advantage in growing corn that should be considered. The land can grow a crop of peas and oats in the winter time and yet be ready in plenty of time to grow a crop of either corn or sorghum. The sorghum that was cut last month is again coming up and if the present warm weather continues it will certainly produce another bit of grazing for the colts. Pumpkins and pie melons are adding a Thanksgiving touch to the animals' feed at present. The pigs are reveling in the cull grapes and everything seems fat and saucy down around the barns.—M. E. Sherman.

BUTCHERING TIME.

Ruth Brown gives our folks, in Farm Journal, some practical points on curing hams, making sausage, smoking, etc., as follows:

Only animals in good condition and perfect health should be killed for eating, for the flesh of those with even a slight disease is unwholesome, and the meat is very difficult to keep after curing. Bruises, broken limbs, or like accidents, have an effect similar to ill health; and unless the animal can be bled and dressed immediately after such an accident, the flesh should not be used for food, especially if there is any rise in temperature.

A reasonable amount of fat gives juiciness and flavor to meat. "Never kill an animal that is losing flesh," is a maxim of good butchers, for the meat is growing tougher and dryer. Never allow an animal to be excited or overheated before killing. It is important that the carcasses should be cooled soon after slaughter, but they must never be allowed to freeze.

Stripping out the leaf lard aids in quickly cooling a pig. For the best results there should be a circulation of cool, dry air. Meat should be cured as soon as the animal heat is out, usually about twenty-four or thirty-six hours after slaughtering.

This is a well-tested recipe for dry-curing hams and shoulders: For 100 pounds of meat use four pounds of salt. two pounds of bown sugar and a quarter of a pound of saltpeter. Mix these well together and divide into three equal parts. Rub one-third well into the ham and let it stand on a board for three or four days, until well soaked into the ham. Repeat this three times in ten days or two weeks. Take up the hams, scrub them off in warm water, hang up and dry, smoke with hickory or apple chips, wrap closely in paper and tie tightly in a bag.

Where a suitable place for dry curing is not at hand, the meat may be cured in brine, which also gives protection from insects and vermin. During warm weather brine should be closely watched. If it becomes ropy, like syrup, it is best to make new brine, or boil over the old. To brine cure, when the meat is cooled, rub each piece with salt and allow it to drain over night. Then pack it in a barrel, with the hams and shoulders in the bottom, using the strips of bacon to fill in between and to put on top. Weigh out for each 100 pounds of meat eight pounds of salt, two pounds of brown sugar and two ounces of saltpeter. Dissolve these in four gallons of pure water and cover the meat with the brine, after boiling and thoroughly cooling it. The bacon should remain in the brine from four to six weeks; the hams from six to eight weeks.

Meat that is to be smoked should be removed from the brine two to three days before putting it in the smokehouse. Scrub it clean in tepid water, and hang to drain for a day or two before smoking. When smoking, hang it so that two pieces will not touch each other. Make a very slow fire of green hickory, apple or maple wood, smothered with sawdust of the same. Do not use pine, or other resinous wood, as it will give an unpleasant taste. If the smoke is kept up steadily, and an even temperature is maintained, twenty-four to thirty-six hours should smoke it sufficiently. Let it air and dry, then wrap in paper and put in heavy muslin or canvas and cover with whitewash, to which some dissolved glue has been added; or use a yellow wash. To make the latter, for 100 pounds of meat use three pounds of barytes (barium sulphate), a short ounce of glue, an ounce and a quarter of chrome yellow, half a pound of flour. Mix the flour in half a pailful of water. Dissolve the chrome in a quart of water, and add it and the dissolved glue to the flour. Bring the whole to a boil, and add the barytes, slowly, stirring constantly. Make it the day before it is required. Stir often while using, and apply with a brush.

For sausage: To each pound of lean pork add one pound of fat. As the pork is usually from the shoulder, neck, etc., it is likely to be too fat unless part of the fat is removed and made into lard. Mix the fat and lean together in chopping. Where a rotary cutter is used, it is best to cut the meat twice; after the first cutting, spread it out thinly and season. To each four pounds of meat use an ounce of pure, fine salt, a half-ounce of ground, black pepper and a half-ounce of sage leaves, rubbed fine. The second running through the cutter should mix the seasoning thoroughly. Sausage will keep for some time if stuffed in skins or in long, narrow, muslin bags, rubbed over on the outside with lard, to exclude the air; or it may be packed in a jar, with lard run over the top.

COSTLY IGNORANCE.

It is astonishing what a price people will pay for ignorance even in this day of advancing intelligence. An example of costly ignorance in the dairy line recently came to our attention. A California man (you couldn't really call a man of his caliber a dairyman) happened in some rather accidental way to come into possession of a few thoroughbred animals, which in a few years multiplied until he had something like ten head of cows, heifers and a bull. He didn't have sense enough to keep up the registration and in this respect alone dropped several hundred dollars.

Recently he decided to sell them all, and apparently having no idea of the demand for well bred cows and their present day value, through being out of touch with everything pertaining to the dairy business, he sold them to a hustling young creameryman who had them sold before he secured them and cleared up something like three hundred dollars on the deal. The third owner, likewise a wide-awake young business farmer, sold half of them for what he paid for the whole lot and at this the fourth owner of part of the herd was satisfied with the deal. That's going some for cow finance but they finally got up to about the level of their real value. Had the original owner been possessed of good sense he would have known the demand for stock of this kind and at a cost not to exceed two dollars could have inserted a small advertisement in a live paper tapped this demand and saved himself from six to possibly eight hundred dollars. And to think how hard the average man works to get this amount of money into his hands. Truly the farming and dairy business demands more mind and less manual effort.—Dairy Review.

HOG CHOLERA SERUM.

A successful demonstration of the value of the new government serum for preventing hog cholera has just been concluded at South Omaha, Neb., by the Bureau of Animal Industry of the United States Department of Agriculture. The efficiency of the serum has been proved many times in the past, but in order that its value might be brought more strikingly before the people of Nebraska a demonstration was arranged for at the Union Stock Yards at South Omaha in co-operation with the Union Stock Yards Company of Omaha.

The stock yards company purchased thirty pigs, weighing from 40 to 60 pounds each, from a farm which had been free from hog cholera for several years. These pigs were brought to the stock yards, and on July 23, 1910, four of them were injected with blood from hogs sick of hog cholera. These inoculated pigs were placed in a pen by themselves, and within five days they had become sick, at which time eighteen of the remaining pigs were each given one dose of the serum, while the other eight pigs were not treated in any way. The eighteen serum-treated pigs and the eight untreated pigs were then placed in the same pen with the four pigs which had been made sick by inoculation.

The four pigs which were first given hog cholera all died, and the eight untreated pigs all contracted the disease from them. The eighteen pigs which were given serum, and which were confined in the same pen with the four original sick pigs and with the sick untreated pigs, remained perfectly well, and were finally turned over to the officials of the stock yards company upon the completion of the experiment, September 17, 1910.

The experiment was witnessed by representatives of the Nebraska Agricultural Experiment Station and of the Nebraska State Breeders' Association, as well as by representatives of agricultural papers published in Nebraska.

The Department of Agriculture does not distribute this serum to farmers, but is endeavoring to bring the value of this method to the attention of the stock-raising interests in order that they may arrange to secure state funds for the manufacture and distribution of the serum. The government authorities consider that this new serum treatment, if properly applied, will result in the saving of millions of dollars.

THE HABIT OF GOING DRY.

One of the most unprofitable things on any farm is the cow that persists in going dry three or four months before the time for her to be fresh. There is a great deal in habit, and if a young cow is started right she will go dry, say, from four to six weeks. That length of time is sufficient for her to recruit her strength. It will pay to give extra food and care in every possible way to the young cow so as to keep up the flow of milk. If she once forms the habit of going dry for a long period she will be very apt to pass the habit on to her progeny. In the purchasing of dairy cows this habit is one of the very important considerations, as it really marks the difference between the profitable and unprofitable cow.—Michigan Farmer.

DUROC-JERSEY HOGS.

There are three great breeds of hogs, and in the order of their numbers they are Poland-Chinas, Duroc-Jerseys and Berkshires, says a writer in the Western Farmer. The Duroc-Jersey hog is rapidly becoming more popular, and deservedly so. They have all the good points of the Poland-Chinas, but the sows have larger litters of pigs and the ability to save them, while the fat hogs when ready for market outweigh Poland-China hogs of the same age and finish. The Duroc-Jersey and the Poland-China breeds originated in Ohio, and constitute the corn belt type of hog. Long grown by breeders who selected for neatness of frame, a result favored by a ration, principally corn, which consisted largely of fat and carbohydrates, and low in content of protein and calcium salts, hogs of these two breeds are chunky, early maturing and producers of the best lard in the world. Hogs of these breeds are fine of bone and fatten easily at early ages, making possible the large run of 175 and 200-pound hogs that were so much in demand during the present year.

Though of the fine-boned, meat-built chunky type of hog the Duroc-Jersey is not so extreme as the Poland-China, being somewhat larger and possessing more scale. Their color is a rich red or mahogany, and is very pleasing. The faults of the breed are, a tendency towards too large litters of under-sized pigs, faulty backs and a tendency to sandy colors. The writer does not have much faith in the oft-repeated statement that sows of chunky conformation are less prolific and poorer mothers than sows of lankier type, for it would seem that it is a question of being too fat. Instead of a question of conformation, it is one of getting too much fattening food and not enough nitrogen and calcium phosphate and other needed calcium salts in the rations.

Secretary James Wilson, of the United States Department of Agriculture declares sugar-beet pulp is the best butter producer in the world. 40c per ton at LOS ALAMITOS SUGAR FACTORY

A GOOD LINIMENT.

One of the good old time remedies in nearly every stable in northern Ohio years ago was the following which many horsemen still swear by: sugar of lead 2 ounces; turpentine 1 ounce; oil of vitriol 1 ounce; tincture of arnica 1 ounce; vinegar 2 quarts; whites of 4 eggs. Put all together in jar and shake before using.

Another old time remedy is the following: linseed oil 1 gallon; hemlock oil 1 ounce; sassafras 1 ounce.

An English remedy to prevent horses from gnawing mangers and feed troughs is to give the wood a coat of tar, put on with an old broom, while hot. It is claimed that this is a sure cure for an annoying and destructive habit.

The mysterious actions of a horse which whirls and bites himself savagely are due undoubtedly to the presence of worms in unusual numbers. The rubbing of the tail is another symptom. The spasmodic reappearance of the trouble, and the almost frantic action at times, are probably due to colicky pain induced by worms. A wise course of treatment is to give a pint of raw oil or four drams of aloes in a ball. After it has ceased to act, give a vermifuge. —Farm Journal.

Arrange the quarters of the breeding sows so as to afford plenty of exercise, and encourage it, as the strength and profit of the pigs depend largely upon it.

A good currying occasionaly does not make a sleek horse. It takes everyday grooming to open the pores, soften the skin and produce a good healthy, sleek coat.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.

Raisins

With the raisin crop short at least 20 per cent and with the output on the whole of excellent quality, raisin men are inquiring as to why such exceedingly low prices obtain. We doubt not lack of organization of growers is at the foundation. If they were largely in one organized body the crop could be so handled as to secure legitimate returns, but with absolutely disorganized forces there seems no probability of a getting together which will result in advantage. We doubt not the packers are directly responsible for the present discouragement for they have maintained a bearish attitude during the whole season until some of the growers have been forced to accept any price offered, and the whole season may pass without a return to profit-bringing prices. Those who are following this great industry have tried various co-operative plans which have repeatedly failed so that now they distrust any suggestion of co-operation. The situation is not desperate, but it is serious enough to make the raisin people willing to give and take until a getting together becomes possible.

Friend of California Gone

Of all the efficient workers in the marketing of California fruits we doubt not Mr. H. D. Foy, representing the California Fruit Growers Exchange at Omaha was one of the best and this state suffers a great loss in his death. Mr. Churchill of the Limoneira Co., at Santa Paula writes:

"It is with keen regret that we advise you of the death, on last Friday, the 28th inst., at Omaha, Neb., of Mr. H. D. Foy who has been the General Agent for Limoneira Company and Nathan W. Blanchard for the past six years.

"Mr. Foy had been in the fruit business about thirty-five years, and no one knew it more thoroughly in its every detail than he. For a long term of years, he was one of the very successful agents of the California Fruit Growers Exchange. During the past few years, he annually sold several hundred cars of oranges and lemons from California, together with an equal number of cars of apples, peaches, pears and cantaloupes from the Colorado fruit district. He undoubtedly conducted the largest independent fruit brokerage business located in the middle west, if not in the entire country."

Sunshine

Perhaps the greatest need in home life on the ranch is more sunshine. At first that may seem the one thing most available, but we have seen so many farm homes which were gloomy, in which but little sunshine was admitted to the house and less to the mental and spiritual life of those who made up the home, that we believe we are justified in making an appeal for the letting in of more sunshine, most especially to the mental life. Bright, cheery, wholesome reading means much to the younger life in the home. It sometimes seems easier to get the other kind for much that is dark and lowering in its tone is found even in some homes. But with the thousands of good books, wholesome magazines and newspapers today we can have the most uplifting reading matter. Of the best of reading matter, especially for the youth, which should include all of us, is the Youths Companion. This weekly magazine takes as its slogan for the coming year, "Sunshine." It states in its prospectus that "for more than eighty years the Youths Companion has been bringing into American households a light entirely its own, a light that has grown in warmth and brilliance with the progress of years." The promise is that the sunshine will be brighter the coming year than ever before and we doubt not the promise will be fulfilled by this old favorite which stays in many homes long after the youths have grown up and become men and women. As a matter of interest in the farm home we may note that Liberty H. Bailey will during the year discuss the size of an acre. The statement is made that the size of an acre depends entirely upon the man who owns it. The reason will be given by Mr. Bailey.

"Chiquenesis"

The above mentioned disease is described more particularly on the poultry page of this issue, and is referred to here not so much because it deals with the poultry people as because the symptoms described are also manifested in all the various departments of agriculture in California. These are more particularly displayed in the literature put forth by boosters who are endeavoring to show the great profits which come from industries in their sections. The walnut or orange tree which under exceptional conditions has given a great return is used as the basis for figuring profits on an acre or on a thousand acres of land. These imaginary profits create false hopes in the mind of the tenderfoot or sometimes the old-time Californian, and often induce him to change his occupation and often to lose his funds. The truth is good enough with regard to our productive industries. Let us stick to it and if possible induce the boosters to do the same.

Eradicate the Pests

This is the best season of the year to take up the work of destroying the ground squirrels, but it is also the season when least work is commonly done, because of the fact that but few crops are now molested as the geatest devastation is in the springtime. But one squirrel killed now is worth a dozen killed in the spring. Succulent feed is now growing so that best success may be secured from use of dry poisoned grains.

Texas Oranges

The Texas Citrus Growers Association with offices at Houston is discussing the matter of adoption of style of boxes for shipping of its Satsumas. The state feels it has a unique position in orange culture and wishes something entirely different for packing Satsumas than is used by either California or Florida. The matter will be decided in the meeting to be held at Houston on the 18th of November.

Farmers Institutes

Imperial Valley institutes will be held under the direction of J. B. Neff, conductor for Southern California, as follows: Calexico, December 12; Heber, December 13; Holtville, December 14; El Centro, December 15; Imperial, December 16; Brawley, December 17.

The meeting of Congress is but a few days away and the Postal Progress League proposes to secure if possible the enactment of a parcels post measure. The Cultivator has mentioned instances in European countries where the parcels post has been of greatest convenience and value. The bill which has already been presented in Congess provides for carrying eleven-pound packages at eight cents per pound and it also provides for the increase of number of delivery systems by permitting mailing of letters or parcels up to four ounces at two cents with charge of one cent for each additional two ounces. In addition, packages up to 25 pounds may be permitted on rural routes with rates varying according to weight, the maximum weight to cost ten cents. This is a good time to imress upon Congressmen the necessity for advancement in our postal department. It has never been self-supporting; it never will be until it enlarges its business so as to take away some of the great profit which express companies have been receiving.

In the matter of co-operation it may be of interest to note that the farmers of this country own and operate sixteen large meat packing plants and that members of the Farmers Union, largely in the South, own and operate in excess of 5,000 manufacturing plants of various kinds. The American Society of Equity also is a large co-operator, owning over 4,000 co-operative manufacturing plants. The Grange is another large co-operator, maintaining many stores and purchasing agencies. Other farmers co-operate in the purchasing of supplies in the Rochedale system of stores. This system has not secured the hold in this country that it has in England. In the matter of doing our own merchandising we Americans are in no way equal to our British brothers.

It is marvellous the different attitude the buyer of fruits manifests toward the man who has strictly fancy, gilt edged fruit and the one who comes with an indifferent or poor article. The attractive fruit he wants and will have; price is a secondary consideration. Consequently the grower has the advantage in the deal and goes home quickly with good money in his pockets. The buyer, if he is up-to-date, knows that the attractive fruit can be sold in double quantity, hence encouragement in the fruit industry is always given where a first class article is produced.

Southern California has for a long time imported great quantities of dairy supplies from the lower San Joaquin Valley, and this will probably continue indefinitely but more recently advancement has been made along these lines. In the Imperial Valley and sections near to the city of Los Angeles great enlargement of the dairy industry has been made. During the past few months over 2000 cows have been added to the herds of Imperial Valley. Other sections in the valleys of the Santa Ana and San Gabriel have felt the impetus of the best prices for dairy supplies in the United States.

New York reports the shipping of Pacific Coast apples to various South American points, all under refrigeration, largely of Jonathans and Newtown Pippins. The farthest south point is Buenos Ayres.

Agricultural News Notes of the Pacific Coast

Northern California

One firm has shipped over 600 tons of hay from the Liveoak section.

Hop growers are holding all the crop not sold hoping to secure the 15 cent price.

The Natomas Company is rushing work on the levees in southeastern Sutter county.

The alfalfa Products Co. of San Francisco has increased its capital from $50,000 to $150,000.

The first car of Butte county oranges for the season was shipped November 1st from Oroville.

The supervisors of San Francisco have decided to prohibit the sale of short-weight packages of butter.

The Petaluma Poultry Association is having a large number of new coops built for the coming show.

Five hundred pairs of Hungarian pheasants have just been received at the state game farm near Haywards.

The short course in horticulture which began at the University Farm at Davis last week will close November 23rd.

Farmers at Yuba City are holding their wheat and barley, not being satisfied with the $1.35 or $1.40 offered for wheat or 85 to 95 cents for barley.

The total shipments of fresh deciduous fruits from Sacramento this season aggregated about 13,500 cars; 100 cars is the present daily shipment.

We note in the Corning Observer that one shipper, Mr. C. S. Jobe, shipped a car of 84 hogs from which he realized a total of nearly $1900, or an average of $22.43.

A company has been formed to reclaim and irrigate 100,000 acres of land near the city of Sacramento. Later the land will be sub-divided in small tracts.

The Gridley Canning Company has acquired a block of land at Gridley and will erect a new cannery and fruit handling establishment ready for next season.

The apple growers association of the Eel River Valley has given especial attention to a finer pack this year and this has resulted in more satisfactory prices.

Bean growers of Biggs, Butte county have harvested the full season's crop and marketed at fair prices.

A new cheese factory has just been established at Yuba City.

The Niles Chamber of Commerce has taken steps for community improvement which it is hoped will give that section the name of the Flower Garden of California.

The Sonoma County Co-operative Poultry Association held its annual meeting at Santa Rosa last week and elected J. B. Jackson President and re-elected C. S. Coy Secretary.

The estimate of the present season's output of hops for California is 69,750 bales. Sonoma county's output is the biggest, being 25,600 bales. The Sacramento Valley will produce about 33,700.

Central California

Visalia is purchasing land for a park.

An effort is being made to secure waterway facilities for Fresno.

Lindsay passed the 100 car mark in shipment of oranges on November 4th.

A new dairy company with $50,000 capital has been incorporated at Fresno.

The Farmers Phone Company at Kerman has chosen directors for the first year.

The farmers institute at Dinuba last week brought out a large attendance.

Fresno county's Fair management finds $500 in the treasury after paying all bills.

Pomona Grange of Tulare county will make a grange exhibit at the coming Citrus Fair.

Some little concern is felt that no soaking rain has been granted over the great central valley.

The Santa Clara County Poultry Association will hold its next annual show in October 1911.

Sanger, Fresno county, is cleaning up on Emperor Grapes and beginning the shipping of Navels.

The Corcoran, Kings county, Board or Trade is discussing the matter of a milk condensing concern.

The work of preparing for the Tulare county Citrus Fair at Visalia is now carried on under high pressure.

The Fresno Chamber of Commerce will make an exhibition California Day at the Chicago Land Exposition.

The contract has been let for a new creamery at Riverdale, Fresno county. It will have daily capacity of 5,000 pounds.

The Apple Annual management at Watsonville has cleaned up accounts of the last show and is now ready for next year's plans.

The San Jose Chamber of Commerce is exhibiting "some pumpkins" in the Ferry Building, San Francisco. One of them weighs 145 pounds.

The Sempervirens Club of San Jose is taking steps to secure additional acreage to the Big Basin Park of Santa Cruz and Santa Clara counties.

MacDonald & Sons' prize winning car of bellflowers, at the Watsonville apple show, was sold October 15 to Lafayette Weinberg, representing Weinberg Bros. of Galesburg, Ill.

The tract of land south of the lake near Corcoran, Kings county, is being homesteaded and some 20 or 30 families have occupied land which heretofore was government land.

At the meeting of Tulare County Pomona Grange recently Visalia Grange won the prize of a handsome silver-mounted gavel for securing the greatest number of new members.

Kings county board of supervisors is making an especial effort to stamp out Texas fever tick and competent inspectors have been appointed to take charge of dipping vats for a thorough round-up.

Southern California

Olive growers are hoping for satisfactory prices.

The Escondido cattlemen report shortage of feeding stock.

Covina, Los Angeles county, held a chrysanthemum fair last week.

Orange county's orange groves promise the biggest output in its history.

Cotton growers of the Imperial Valley have been granted a reduced rate to Galveston.

War of the creamerymen of the Imperial Valley is giving the poducers increased prices.

County Bee Inspector Pleasants of Orange reports almost entire freedom from foul brood.

Bolsa and Wintersburg, Orange county, will ship about 200 cars of celery this season.

Ontario fruit growers have tired of continual fruit stealing and are now arresting the pilferers.

Coachella Valley cotton picking still continues and some very fine fiber has been baled.

San Bernardino has recently completed a large cold storage plant for apples and other fruits.

A few sections of Southern California are shipping Navels as yet and the Valencia output is ended.

The stockholders of the Riverside Land Company re-elected the entire board of directors at the recent annual.

The Antelope Valley claims to have possibilities for the biggest honey production of any section of the state.

Escondido raisin producers are giving attractive pack to this season's raisin output and finding good returns.

Many orchardists are considering the advisability of planting more extensively of the avocado or alligator pear.

The heaviest daily shipment of beets ever received at the Chino Sugar Factory was 55 carloads on one day last week.

The grape growers of Imperial Valley will meet at Brawley at an early date to be addressed by Mr. Geo. C. Hussman of the Department of Agriculture.

Olive pickling establishments are paying $5.00 to $10.00 more per ton than last year. The crop is somewhat short. Some estimate the shortage at 33 1-3 per cent.

The Escondido Citrus Union has just completed a new packing house and has machinery installed for the fall cut of lemons. The output will be about 250 cars.

The horticultural commissioner of San Bernardino county will take charge of the apple orchards in the Oak Glen section and spray trees for San Jose scale.

The Limoneira Lemon Co. at Santa Paula is properly proud of the fact that one car of its lemons recently sold in New York City for $3653, or an average per box of $10.85.

The Coast

Spokane hop growers are making sales at 15 cents.

The Hood River apple crop is practically all harvested.

Five cents apiece is the egg price in Seattle, Washington.

Portland hop market is running close to the 15 cent mark.

A Walla Walla onion grower realized $1750 from one acre of onions.

A cent a pound is the prevailing price on potatoes in Portland market.

A North Yakima apple grower cleared $1872 from one acre of apples.

Hogs are commanding at the Union Stock Yards at Portland, Oregon, $9.60.

Bluestem wheat dropped four cents a bushel in one day at Tacoma last week.

Jap gardeners at Montesano, Washington, harvested this season 525 tons from 75 acres.

Alfalfa seed producers in the Yuma Valley are shipping seed to the Los Angeles markets.

Short courses in agriculture will begin in the Colorado Agricultural College January 9th.

A co-operative creamery is planned and will be in operation at Kimberly, Idaho, January 1st.

A car of Oregon productions has been made up for exhibit purposes in various eastern points.

The queen of the National Apple Show at Spokane was crowned and installed in office on Monday.

The Territorial Fair at Phoenix last week was the most successful of any ever held by the association.

The hop market at Portland is stiffening and is now commanding 15 cents or 2 cents over previous quotations.

The Department of Agriculture of the Hawaiian Islands will institute a suit against the heirs of Kehena II in condemnation of land for forestry purposes.

To prove the keeping quality of apples grown at Moscow, Idaho, exhibits will be made at the National Apple Show in Spokane of fruit which was picked in 1908.

The work of boring the tunnel under the Colorado to carry water to the Arizona side near Yuma will soon be taken up under direction of the reclamation service engineers.

The entire preamble adopted for the new constitution of the state of Arizona is as follows: "We, the people of the state of Arizona, grateful to Almighty God for our liberties, do ordain this constitution."

Farmers near White Salmon, Washington, have discovered a new process of removing stumps. It is called the "charpit" process and consists of stripping bark from the stump, surrounding with fuel and when once completely on fire the whole mass is covered with earth as in the manufacture of charcoal. The fire then eats its way to even the tips of the roots.

Coulson's
EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying powers and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the famous Coulson products and gives valuable information about Poultry Raising.

Distributing Agents for California

The worst thing we have to contend with in getting new customers to try

West Coast Egg Food

is the "stuffs" that have been put on the market called "egg foods," largely composed of unsound grains, mill refuse, and cheap, very cheap, Japanese rice bran and such offal. When we once get a trial of "West Coast" we have no further trouble. No such stuffs in ours. We are winning out in great shape by making first-class feeds at prices as low as those "cheap" ones. Try "West Coast" just once. 75-lb. sack only $1.80, or $45.00 per ton. If not sold by your dealer, send to us. Or, if you are distant from Los Angeles and have good grain products cheaper than to ship them in, you can make your own Egg Food as good as anybody's.

Egg-More Booklet

tells you how. It is free. Send for it. Send us addresses of 5 persons in your vicinity who have fowls, and we will send you an Anchor Egg Separator. Or, for 20 addresses, we will also send The Poultry Manual, a book well worth 50c, both postpaid.

Practical Poultry Culture

GREEN FOOD.

By Henry Langenschwadt, San Jose.

In those sections of the country where there is cold freezing weather during the winter season, it is a problem to supply green food for chickens during that time. Certainly fresh greens would be most desirable but are out of the question then. Dry cut clover or alfalfa, beets, mangels, etc., are much used.

Grain and meat are concentrated foods. In addition something bulky and at the same time having other elements present is needed. We would not attempt to feed cattle on grain only. Hay is fed abundantly. Our own systems go wrong when given too much rich food. Chickens need green food and lots of it.

The time is about here that those whose hens have their liberty will not need to worry about green food. But it hardly lasts half of the year. There is another time. In the greater part of California we have a dry season when there is little fresh green food to be had unless specially provided for. We should make provision in some way that we have abundant greens, in fact all the year round as well as during the dry season.

How about your hens, or the chicks you are planning to raise next spring? Are you thinking of the green food for them? The time is at hand to prepare for it, so that you have it when needed.

Certainly it would be best if the fowls could range where green food is growing. Comparatively few are able to have such a field for their hens all the year. One can, or should, have a piece of ground large enough to furnish green food for the size flock you have. Now is the time to plow and get in good shape for planting. It will depend upon the nature of the soil, what you intend to plant and how you should cultivate it. If you have water and can irrigate, so much the better. In some localities there are soils of such a nature that enough moistue can be retained when properly worked so that a hardy plant given a good start while there is rain will be well rooted and grow when rain has ceased. In Petaluma district much kale is fed chickens for green food. It flourishes there without irrigating.

We could trace many of the failures to get good results from chickens to the fact that they do not get the green food they should have. How they do relish it! Even the little chicks just a few days out of the shell; they will work like bees at the tender leaves when placed before them till consumed or they cannot possibly eat more. At all ages and from the beginning of the year until the end give your chickens all the green food they care to eat. Then with the grains and meat they are fed, other conditions being good, you will get results. Chicks will grow faster, pullets will lay sooner and a larger egg yield the year round will be had from hens. Also hens will be laying sooner after their molt if they always have had plenty of greens.

We say abundance or plenty of greens; not just a little and then maybe only occasionally, but all they care to eat at all times, to be fed every day. Get the right idea of what we mean by plenty. Not like we happened to see a party feeding a small dish of greens to a large flock of hens. It would hardly have satisfied the appetite of half a dozen hens. Yet these people fed greens to their chickens. Similar instances could be related of many others likewise. Start your chicks with some tender greens a few days after hatched and then keep on feeding greens every day—whatever you may have that is good.

There is another thing you want to remember, and that is that hens fed plentifully on fresh green food will lay larger eggs than those that are not. A party spoke of the large eggs he was getting from his flock. No wonder; they had free range in many acres of alfalfa.

Green food helps to balance the ration so that a hen can assimilate and digest more concentrated foods like grain and meat, putting her in such condition that she can lay eggs. You will find that the good laying hen is a good feeder and likes greens.

There are many different greens which can be fed to chickens. Alfalfa makes a most excellent food. Chickens that can range in a field of it do well. But in most cases it has to be fed. It is best then when cut into short lengths. Cut alfalfa hay is good if the fowls are accustomed to it. They do not seem to relish the fine meal as much. In some parts of the country, clover is used in place of alfalfa.

Kale makes a good fresh green food. It is a hardy plant and is very much used in some sections. Swiss chard and rape are often grown. Beets and mangels can be used. It would be best to have some other greens to change and not use roots exclusively for green food. Sprouted grains are being used by some. A field in which grain is a few inches out of ground is fine for young chicks. Lettuce is very good for chicks just hatched. Many more might be added, but have mentioned a few that are most commonly used.

You will generally observe that successful poultry raisers feed green food and aim that their chickens are never without it. It is essential particularly in warm weather. The manner in which it is relished by the flock will tell that they need it. Always feed plenty of greens.

"CHIQUENESIS."

A writer in the Rural New Yorker gives the following good take-off upon "Chiquenesis" which has to a certain extent been epidemic in California.

There is an incurable mental disease known as paresis, usually running its course to a fatal termination within five years, in which the victim imagines himself fabulously rich, and able to do all sorts of great things. I have invented a word to describe a mild and not necessarily fatal mental condition suffered by many people: chiquenesis. They feverishly dream of hens that lay an egg every day, and of profits in poultry culture that would lay the average mail-order business in the shade. The attack is brought on by the chance account of what some lucky wight has made with a dozen hens somewhere, and one symptom is the tendency to multiply these estimated profits by the number of hens, etc. The disease is

60,000 "Queens" in the Contest

all along the line last year, and the Queen never fell behind. Friends, you will be interested in knowing about the uniform big hatches produced by the

much aggravated by the advertisements of the various "systems" by means of which so many dollars per square foot can be coaxed out of the soil of a backyard full of chickens in the city; of $10,000 "Peggies," ten-dollar eggs, etc. Chiquenesis as a rule is fatal only to the person of small means and smaller patience and can be cured by a few years of sad experience. The great number of victims is a source of much profit to the dealers in the guff that causes the initial attack, and happy is the victim who can turn his own losses to gain by helping skin others of his class. This is no fling at legitimate poultry business, which is increasing in importance every day, but at the hysterical, overwrought exaggeration of values of poultry which enriches a few and disgusts and impoverishes the many. A years' reading of your conservative and well-balanced paper would be profitable to such victims.

FANNIE WOOD'S POULTRY TALK.

It should be remembered that late-hatched turkeys are not desirable as breeders. Keep the earliest hatched birds for next year's breeders if you want to maintain size and vigor in the flock.

Hens will do well on almost any kind of feed if they have enough of it; but they certainly can not make eggs unless they are supplied with certain necessary elements for egg-making.

Meat scraps put up especially for the hens may be had in almost any market, and it is a very necessary egg-producing feed at this time. Crushed oyster-shells are needed, also.

If it is out of the question for you to furnish house or houses large enough for the fowls you have, the best thing you can do is to cull out and sell until you have on hand only enough to house comfortably.

Nothing ever happens without a cause. One of the things that will surely cause sickness among chickens is crowding 150 fowls into a house large enough for only fifty or at most seventy-five.

Homeless hens, sleeping upon fences and in trees, and shivering in unprotected places during the wintry days are not comfortable; under these conditions, it will take all the food they will eat to keep them alive. The owner will get mighty little profit from the eggs they produce.

An essential to the hen's comfort in cold weather is a floor where no drafts are felt. While you are repairing the chicken house, bank it up well on the outside and if the floor is of earth, make sure to have it higher inside than the ground without.—Farm Journal.

KEEPING POULTRY IN CONFINEMENT.

A subscriber wishes to know if she can keep chickens confined in a lot forty feet square. Chickens can be kept in a very small space if that space is properly tended. Some breeders keep six hens in a portable house three by six feet the year around, and get good returns in eggs and fertility, but it requires more work to keep chickens in cramped quarters than with larger range. The ground must be frequently spaded and kept clean in a small enclosure, the grain buried in the litter to induce exercise, and the coop or colony house kept scrupulously clean. All the average farmer's wife has time to do to the chicken houses is to keep them reasonably clean; the small lot is all right, but keep a plentiful supply of grit and litter in the lot, provide green food each day, and if the ground is left bare, keep it spaded up and sweet-smelling. A poultry yard should be graded to let the water drain away from the house. A damp run is unwholesome.—Wallace's Farmer.

THE VALUE OF UNIFORMITY.

In culling a flock of either chickens or turkeys, try to choose and market birds of nearly the same size and weight at the same time. The butcher does not look at individuals when he estimates what he can pay for the chickens; he is impressed by the character of the lot. If there is but one undersized, roupy, sick-looking bird, he is suspicious of them all and offers a lower price than he would give for a coop of healthy, vigorous-looking birds.

If there are a few scaly-legged hens, don't put them in with young chickens; have the marketing coops made with a partition, and separate young and old, and old roosters. Care in grading means better prices and a welcome at the market.—Wallace's Farmer.

EGGS FOR SHOWING.

A commendable feature of some of the fall shows is the class for fresh eggs. The usual plan seems to be to charge no entry fee for the exhibit, but to take possession of the eggs—a higher entry fee at the price of winter eggs than is charged in most classes. Eggs for showing should be absolutely fresh and full. If they are to be held a few days, pack them in bran, air cell down. Double-yolked eggs are not desired. If a prize is given for the largest eggs, it is with the intention of rewarding the breeder who has hens that habitually lay large eggs, not for the occasional double-yolked egg. The standard of judging eggs gives freshness 30 points, color and evenness of shell 20, size 10, density of white 10, roundness of yolk 10, firmness of chalazae 10, breaking out of shell evenly 10. In candling eggs for freshness, the judge takes into consideration the size of air space.—Wallace's Farmer.

Turkeys meant for exhibition and breeding should not be fattened. Should the gobblers seem overfat, it is well to confine them for a while before the breeding season, feeding sparingly to reduce their weight. A gobbler is in the best breeding condition when he is thin and active. Choose the birds with the longest breast bone for breeders.

TO CALIFORNIA POULTRY RAISERS

Have your chickens got Roup, Canker, Diarrhoea, or Chicken Pox? If so, you can cure them in a few days by using Merval.

At the present time, some of the largest Poultry Raisers of California are using Merval and are all delighted with the results.

If you have sick chickens, get a can from your Dealer or send us $1.00 and we will forward you post paid a 1 lb. can.

Do it now. Remember, Merval wont cure dead birds.

Let the Hart-Parr Do Your Work

The best evidence of HART-PARR merit is not trophies or medals won in one-hour tests by so-called motor contests handled by experts from the factory, but by the thousands of satisfied users themselves, for the past eight years, the majority of whom have the means to pay any price for a machine if they were able to find one that would be better than the "Modern Farm Horse."

Is it not a logical reason that we have the largest factory in the world devoted entirely to the manufacture of Gas Tractors? We will leave it to you. Do you think we could build and keep this large plant running night and day for years and then not be able to meet the demands?

Could we do this year after year, if we were not building a Tractor that was doing all we claim for it?

Did you ever stop to consider which was the hardest test for a Tractor to stand, a one-hour test in a so-called motor contest by an expert from the factory on one individual machine, or on over 2500 Tractors, some of them that have been running for the past eight years? We will leave it to you now if you were going to buy a Tractor on its past performance, would you not choose the one that had stood the test year after year? That is the kind of a Tractor the HART-PARR has been for the last eight years. Not a winner of one-hour tests by experts from the factory, but a winner of several years' test by the men who own them. Are you not interested in this kind of a Tractor?

Remember this when you are considering the purchase of a Tractor, Can I get repairs without delay, and will they be interchangeable and fit without any trouble? We carry a complete stock of HART-PARR repairs in Los Angeles and we will guarantee them to be absolutely interchangeable, and will pay you for any loss of time that you may have on these parts not fitting.

THE GARDEN

JAPANESE IRIS.

The Japanese iris, when first introduced, consisted of but three sorts, and these at once created a sensation by the magnificence of their blooms, much larger than the older known kinds, and of much richer color. At the present time the varieties are very numerous and of great variety of color, allowing of the possessing of a varied collection. In one of our horticultural papers of recent issue, one of its writers said it was quite a mistake to think these Japanese sorts required a great lot of water, that they flourished very well without it, just as the old type of flags did. The writer has seen them under all conditions, and is sure that with more than the usual water they flourish better than without it. We see flags growing in all collections and situations in gardens, and growing and flowering, too, but even the old style kinds, German Iris, as many call them, do better in deep, rich soil than in that of a shallow nature.

Some years ago the writer says, on Long Island, New York, a plantation of the Japanese Iris in a low piece of ground, so low, in fact, that facilities were there to flood them with water at times, and this was done every few days, and the splendid foliage and dazzling display of flowers will never be forgotten. It is the writer's belief that both the old varieties and the Japanese ones are the better for lots of water. The wild ones of our own country are always in wet places. Give the Japanese ones position where the soil is deep and damp, and flowers will be had, meriting the name for them common with some who admire them, i. e., "the poor man's orchids." The Japanese ones are rather later flowering than other kinds, and as in the older ones were some blooming in April. It is now possible to have a collection from which flowers may be had from early spring until autumn.—Practical Farmer.

BEAUTY OF THE DAY LILY.

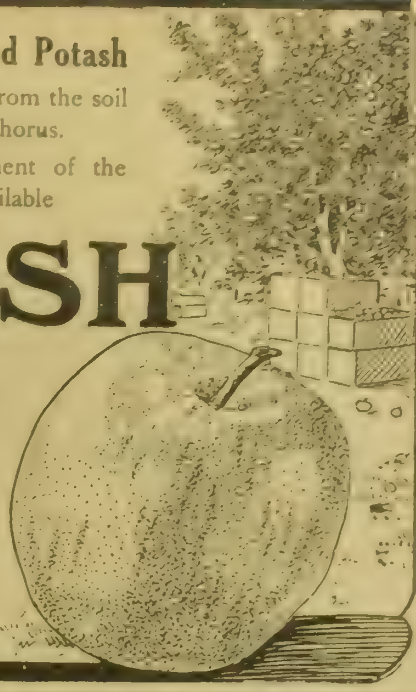
Every one admires the Day Lily (Hemereocallis), which in late years has been greatly improved. Earlier there were only a few sorts to select from, but today we have a good range of colors and a long season of blooming, the result of the hybridist's art.

Those who enjoy lilies in yellow shades in particular will find in this species much enjoyment and success for their efforts. This plant may be grown from seed or divisions of old plants. They are very certain bloomers.

They may be planted at any time and will stand more indifference than most plants. Every plant-lover should have some of the later introductions, as the improvement has been more wonderful in this than in any other plant I know of. I have done much hybridizing on this plant and my work has given exceptional returns and I have secured larger blooms and more beautiful shades than in other flowers.

Below are a few of the best sorts:

Flava, early, deep lemon yellow; Dumorteri, early, brownish yellow; Fulva, the old tawny day lily; Thunbergi, late, lemon yellow, very free; Aureola, pale yellow; Aurantiaca major, deep golden yellow; Disticha, deep golden yellow, double; Kwanso, double fulva.



Both Tree and Fruit Need Potash

Apple trees take more Potash from the soil than they do Nitrogen and Phosphorus.

Especially does the development of the fruit depend on the available

POTASH

Increased yields of larger, firmer apples, well flavored and rich in color, follow applications of Soluble Potash Salts.

Orchardists everywhere are proving that Potash pays.

See that your fruit tree fertilizer contains at least 10% Actual Potash, that is 400 lbs. Sulfate of Potash in each ton of fertilizer.

Our latest pamphlet, "Potash Pays," is of especial interest to Pacific Coast farmers. Sent free upon request.

Irrigation and Forestry

A TIME OF DROUTH.

The loss of cattle and horses during the famine years was one of the greatest calamities that ever visited California. The assessed value of property in Los Angeles County in 1860 was $3,650,330; in 1864, $1,622,370. Over two million dollars of property was swept out of existence, a percentage of loss greater than that of San Francisco by the earthquake and fire in 1906. On the cattle there was no insurance or salvage—the loss was total.

The great drouth began in 1863 and lasted two years. In the winter of 1862-63 the rainfall was less than four inches and in 1863-64 it was little less than a trace. By the fall of 1863 all vegetation had been licked up from the sun-baked plains by the hungry herds, and the cattle were dying of starvation.

As the time for the rainy season approached the rancheros anxiously scanned the heavens for signs and portents of coming storms, but none appeared. The heavens were as brass and the former and the latter rains came not. The winter passed and the hot, dry summer was upon them. Cattle were dying by the hundreds every day. Herds of gaunt skeleton-like forms moved slowly over the plains in search of food. Here and there, singly or in small groups, poor brutes, too weak to move on, stood motionless with drooping heads slowly dying of hunger.

In the long stretch of arid plain between Los Angeles and San Diego there was one oasis of luxuriant green. It was the vineyards of the Anaheim colonists, kept green by irrigation. The two square miles of colony grounds were surrounded by a close-set willow hedge, and the streets were closed by gates. The starving cattle, frenzied by the sight of something green, would gather around the inclosure and make desperate attempts to break through. A mounted guard, armed, patrolled the outside of the barricade, day and night, to protect the vineyards from incursion by the starving herds. There was no relief for the wretched condition. There was no means of shipping the starving cattle out of the country and no feed to ship in. The small amount of feed raised by irrigation was scarce sufficient to keep a few domestic animals alive. Hay sold for $150 a ton and feed barley for $100.—Professor J. M. Quinn, in September Monthly.

GATHERING SEED FOR REFORESTING.

Broadcasting has already been found to give good results in some regions. It was first tried in the Black Hills of South Dakota, with an encouraging outcome. To broadcast an acre of land with yellow pine seed about eight pounds of seed is used One of the most formidable drawbacks to this method is the extent to which the seed may be consumed by birds and rodents. If the season happens to be one in which food for these animals is scarce, the loss is very heavy. The problem of control of animal pests, such as field mice, ground squirrels and gophers, which eat the tree seeds, and also the further problem of preventing the depredations of rabbits, which are altogether too fond of the little trees themselves, whether nursery or field-grown seedlings, is receiving the attention of the Biological Survey experts of the Department of Agriculture.

In some localities the Department has had to purchase seed, but most of that used is gathered by Forest Service men themselves. The cost of gathering has varied for the different regions from thirty-five cents to one dollar a pound. As a rule the seed is collected in the fall months, when most conifers ripen their seed. Parties of three or four men ordinarily work together. Where lumbering is in progress the collectors follow the sawyers and take the cones directly from the felled trees. In standing timber, the task is much more arduous. The men must often climb tall pines and pull the cones from the branches as best they can. Where these are on the extremities and beyond the reach of the hand, pruning shears are used. The cones are dropped to the ground and then gathered into buckets and transferred to sacks, in which they are carried to a central point for further treatment.

The extraction of the seeds is tedious rather than difficult In some cases the cones are spread out upon sheets in the sun, when, after a time, they open and the seeds drop out; in other cases it is necessary to resort to artificial heat. This is applied by placing the cones upon trays with screen bottoms and raising the temperature of the room to the proper degree. The cones open, the winged seeds fall out, and the seed is separated finally from the twigs and dirt by a fanning mill. A good many seeds have been removed from the cone by hand, but this is a sore trial to the fingers of the pickers and an exceedingly slow process.

CENSUS IRRIGATION INVESTIGATION.

The opinions of government and state officials, corporations, and persons expertly informed on the subject of irrigation in the United States will be obtained by Census Director Durand with reference to the number and nature of the questions in the schedules of inquiry, and to the character of the printed instructions for the use of special agents, which have been tentatively prepared for the Census Bureau's impending irrigation investigation.

By the act approved February 25, last, amending the act providing for the taking of the Thirteenth Census, Congress required the Director of the Census to make a special detailed investigation in the United States. The act provides that the information shall show the area irrigated in the arid regions of the United States; whether such work is carried on under federal or state laws; the prices at which irrigated lands, including water rights, are obtainable; the character and value of crops produced on irrigated lands; the amount of water used per acre; and the location of the various irrigation enterprises, together with a description of their methods of construction, their physical conditions, the amount of capital invested, and the like.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Peas Destroyed.

I enclose growth from my peas which are infested with small green worm. It eats the outside of the leaves so that only the fiber remains. What will destroy it? Sulphuring seems to do no good.—Subscriber, Sespe.

Mr. Essig answers: "The samples of the insect larvae infesting pea vines were badly crushed. From the remains it was evident that the injury was caused by a small green larva of a butterfly or moth, the final determination of which cannot be told without adult specimens.

"This makes no difference in the remedy, which should be a poison because the larvae actually devour the foliage. Sulphur, as the correspondent says, can do no good. Therefore spray with lead arsenate mixed as follows:

Lead arsenate	10 lbs.
Water	200 gals

"First mix the lead arsenate in three gallons of water and then add full amount of water. Apply spray while the foliage is dry. There is no doubt but that the above spray will stop the damage immediately."

Lice in Hay.

I find in examining hay which we are storing in barn that it is full of lice very similar to chicken lice but smaller. They are white and very active, from the size of chicken mite to one-eighth inch long. One of the barns was built last year and never has had chickens near it. Will fumigation help? The barns are very large and it will be difficult to make them tight enough to hold gas.—Subscriber, Orange.

Mr. Essig answers: "The louse spoken of is evidently one of the common mites. More than likely it is the common clover mite, Bryobia pratensis, which sometimes is very troublesome in houses and barns. I cannot answer definitely concerning these until I may have specimens. In a very open barn, it is not likely that fumigation would accomplish much with reference to these lice. Salting the hay as it goes into the barn is a good practice to keep out insects. If the barns can be closed up fairly tight, it makes no difference how large they are. Certainly all of the living forms may be killed by using a heavy dosage of hydrocyanic acid gas."

Root Knot.

Is there remedy for root knots which are forming on my walnut trees four years old last spring? I noticed development of this trouble two years ago and now many trees are affected just at the ground and below where the trees swell and the knotty growth is formed.—Subscriber, Greenfield.

This is the ordinary root knot, one of the most perplexing troubles of stone fruit trees. It is practically impossible to control it, though where but few trees in an orchard are affected, some growers have secured fairly good results by chiseling off all the fungous growth, for it is a fungus, cutting until healthy wood is uncovered. Bordeaux or other antiseptic wash is then used to cover the suface of the wound, and if close watch is kept to keep down further recurrence of the trouble the trees may be saved, but if it is comparatively general over the orchard it is probable the ground was infected with the fungus spores when the trees were planted or the trees had the trouble in nursery when purchased. In either case there is little possibility of ever bringing the orchard to best bearing condition. Still worse, the planting of stone fruits in the same ground is not advisable.

Pruning Walnuts.

Do you recommend cutting back branches of grafted walnut trees in five-year-old orchard so as to force some fruit wood growth? At what age should young black walnut trees be grafted for best results?—J. H. H., Gilroy.

We would not head back any five-year-old walnut tree as the tendency is to produce wood instead of fruit spurs after cutting back. If it is necessary to prune the tree try to cut back to another branch that is starting in the right direction. Young black walnut trees can be grafted at any size above three-eighths inch in diameter. We think the most satisfactory tree is made by setting the young native black walnut trees in orchard form when two years old and then grafting when they are large enough to graft at five to six feet above ground. In this way you will have a rough bark trunk that will not sunburn and will not readily be damaged by careless teamsters. Nothing will be lost in production as the top will be formed by the time the tree is old enough to bear fruit.—J. B. N.

Seeding Alfalfa.

Should alfalfa be seeded in dry ground before rain or is it better to wait till the ground is damp?—Subscriber, Fowler.

I do not think it makes much difference if fine garden-like tilth has been secured. The reason why more people succeed in making a good stand of alfalfa in February than in any other month is because they do get the soil easier in a fine mellow condition at that time than earlier in the season.

The rain here, after the soil is well soaked and beginning to dry out, has a slaking action. The particles then slide off more easily and the seed is covered lightly and yet perfectly. The season is sometimes frosty before the first of the year and that has a bad effect on the young plants. I have planted alfalfa every month in the year when conditions were otherwise right and the only months I would avoid are June and July. The trouble then is that the young plants must be watered and yet they do not shade the ground and scale rather badly. If it should happen to be one of those rare seasons when neither month is hot, then the plants would go through. One of the best stands of alfalfa I ever secured was on the dry seeded barley field. I wanted the alfalfa to come quickly and sowed it in August on the dry seeded barley field. It grew like everything and when cut for barley hay it was hard to think that there had been room for any barley, the alfalfa so quickly made a crop of hay.—M. E. S.

Rife Engine Co. 2491 Trinity Bldg., N.Y.

IHC

OWN YOUR OWN IRRIGATION SYSTEM

CONVERT that creek, slough, pond, or other source of water supply that you think is worthless into a valuable asset—make it irrigate your entire farm.

You can have a dependable irrigation system of your own which will free you from the worries of uncertain rainfall and make you entirely independent of irrigating companies.

You know it is not so much the scarcity of water as the getting it from the place where it is not needed to the place where it is valuable.

An I H C gasoline engine will solve this problem for you by pumping the water economically and unfailingly. You can start the engine at any time and irrigate the crops whenever they need water—thus you are made master of the situation.

I H C Gasoline Engines

require very little attention and will pump water in large quantities economically and unfailingly. An I H C gasoline engine will not only serve as the basis for your irrigating system but it will run your fanning mill, feed cutter, grindstone, bonecutter, churn, washing machine, and all similar machines.

I H C gasoline engines are made in the following styles and sizes:

Vertical—2, 3, 25, and 35-horse power.

Horizontal—(portable and stationary) 1, 2½, 4, 6, 8, 10, 12, 15, 20, and 25-horse power.

Tractors—12, 15, and 20-horse power.

Air Cooled—1, 2, and 3-horse power.

Sawing and spraying outfits.

For detailed information concerning the one best suited for your individual use please call on the I H C local dealer or write to our nearest branch house.

I H C Service Bureau

What is it? A clearing house of agricultural data.

What does it do? Helps farmers to help themselves.

How can it be used? By sending your farm problems and puzzling questions to the Bureau.

We are co-operating with the highest agricultural authorities and every source of information will be made available to solve your difficulties. We shall be pleased to have an opportunity to assist you. Write the I H C Service Bureau.

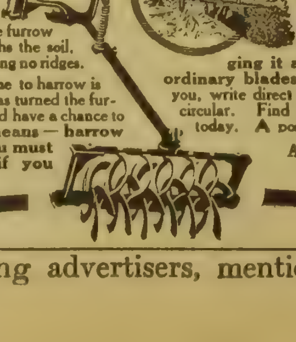
Harrow While You Plow

Put your ground in perfect condition for planting at one operation—by using the Racine Rotary Harrow Attachment for Plows. Readily attached to gang or sulky plow. Follows the furrow and cuts, packs and smooths the soil, keeping in moisture and leaving no ridges.

You know that the best time to harrow is immediately after the plow has turned the furrow—before the sun and wind have a chance to dry out the soil. That means—harrow while you plow. But you must get the right harrow if you want best results.



THE cutting blades of The Racine Rotary Harrow Attachment for Plows are curved. They cut throughout their full length—not simply at the point. Positively cannot clog or wind—self-cleaning. Bury the trash and litter well under the soil instead of dragging it around to the surface as do ordinary blades. If your dealer can't supply you, write direct to us for handsomely illustrated circular. Find out about this big labor-saver—today. A postal will do.

Los Angeles, Cal.

Poison Orange Trees.

How can I get rid of the shoots of poison oranges? The trees are on other property, but shoots are continually coming up in my yard.—Mrs. R., Petaluma.

We do not know what the "poison orange" is, though from reference to shoots perhaps the osage orange is meant, but in any case we would not know how to prevent shoots coming up excepting by continual hoeing or cutting off beneath the surface. If any chemical is used to destroy the plants it will also affect the soil for any other plants which may be desired.

Bermuda for Stock.

I have heard that there are some varieties of Bermuda grass valuable for stock and poultry. Will it hurt stock to pasture on milo and sorghum after frost?—Subscriber, Fresno.

Bermuda is used extensively in the Southern States as a pasture, many farmers cutting it for hay, but alfalfa and other plants are so infinitely superior to it that we would not advise its use in California. We have never heard of stock in this state being injured by pasturing on any of the sorghums, but there is a prevailing belief that a poison is formed—in fact it has been known to occur—but many stock growers take the chances and get the advantages of this wonderful forage plant.

Silver Holly.

I am sending leaves of a desert plant growing near here. Would like to know whether it can be propagated by cuttings or seed and would like its name. The leaves are almost perfectly white and it is a very striking plant. Do not know whether it blooms and forms seed pods or not.—A., Barstow.

We imagine the reproduction of this plant would be attended with many difficulties, but doubtless it should be from the seed. The leaves were submitted to a botanist of wide experience in California plants and he says: "This silver holly is apparently an atriplex or salt bush, one of the most common tribes of plants that are to be found in alkaline soils. It is impossible to give the specific name without a specimen of the fruit. All these plants grow readily from seeds and in a soil slightly alkaline may be sown in the springtime with every prospect of a successful growth."

VETERINARY

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Teeth Need Attention.

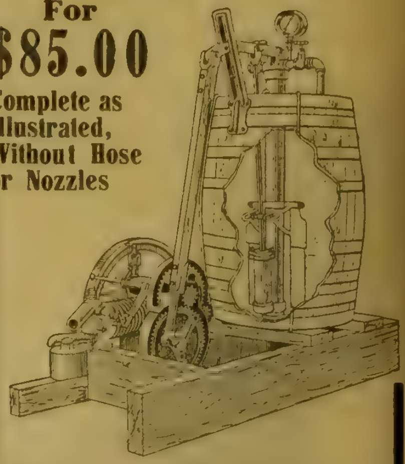
Have mare about 18 years old troubled with water dropping from her mouth while eating, sometimes so badly as to wet the hay. Seems to be healthy in other ways, eats well, but gets thin. Has been this way for two years.—Subscriber, Wildomar.

It is impossible to know very much about the mare at such long range. There may be several teeth lost out or there may be some very long ones cutting her mouth badly. There may be caculi in the salivary duct, or there may be sores in her mouth from eating barley hay. There are many things that will make a horse drool.—R. T. W.

Wart.

My horse has cancer wart near hoof

Power Sprayer
For
$85.00
Complete as Illustrated, Without Hose or Nozzles



Most complete low priced power sprayer on the market.
Bronze plunger, gland and valves.
Large air chamber.
Positive agitator.
Relief valve and pressure gauge.
Air cooled gasoline engine.
Uses only one pint of gasoline every three hours.
100 lbs. pressure with six mistry nozzles.

EUCALYPTUS

The best that 40 years experience can produce, being grown slow, in the cool atmosphere of the coast, are more hardy and more vigorous than those grown in the hot interior of the State.

Correspondence Invited.

W. A. T. STRATTON, Petaluma, Cal.

on foreleg. Can it be removed?—Subscriber, Pomona.

Cut the sore out a little below the level of the skin, or it may be cut level with the skin and burned with a red-hot iron. Then bandage on the sore a pad of cotton saturated with the following solution and change every other day: Formaldehyde, two ounces; water one gallon. The dressing must be kept on the sore all the time or the sore will not heal. It may be necessary to get a leather boot to hold it in place.—R. T. W.

Hardening of Skin.

Have pure-bred Duroc-Jersey boar imported from Kansas fourteen months ago. Was then three months old, in good condition. Afterward discovered on each shoulder place the size of two hands which is hardened or caked under the skin and apparently an inch thick. Seems to be a hardening of the skin tissues and moves freely back and forth. Does not seem to be sore. Boar is not overfat. Is this case of ossification of skin?—Subscriber, Morganhill.

The condition you describe is very peculiar and unusual. There is no probability of its becoming ossified, but is more likely to become a tumor.

The less liniment or medicine you rub on it the better, but if it should become very large it may have to be removed.—R. T. W.

Legal Queries

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Reponsibility for Damages.

We rented our farm last December for one year for cash rent and the contract stipulated that the place and everything on it should be returned as renter received. Recently a neighbor set fire to weeds on his place, the fire escaped and burned berry vines and injured peach trees on our place. To whom should we look for damages in this case, the neighbor who caused the loss or the renter under our contract? In addition the renter has not kept his contract as when he rented the place there were about 200 loads of pumpkins and pie melons and about eight acres of alfalfa nearly knee high. There are now no pumpkins or pie melons and the alfalfa is being pastured close to the ground.—Subscriber, Hardwick.

The one who is responsible for the fire and consequent damage is the one who negligently permitted it to do the injuries, in other words the neighbor.

The tenant has a right to reasonable use of the premises, and I should judge that pasturing the alfalfa, if an ordinary method of use and not destructive of the patch, would be a reasonable use of the premises.—E. L. P.

Trespass.

I am told the supreme court has rendered a decision that poultry which has escaped from its owner's gounds may be treated as wild game and killed by anyone.—Subscriber, Hemet.

It seems impossible that a case regarding trespassing poultry could ever reach the supreme court, unless a criminal case, and quite impossible that the supreme court, could decide domestic animals to be wild game when off the owner's premises.—E. L. P.

Divorce Proceedings.

Is a divorce legal when one of the parties was not notified of any proceedings? Can husband sell real estate without wife's signature under this divorce; also can he marry again, and his marriage be legal? What provision can the divorced wife compel him to make for her support? If his divorce is legal under laws of Wisconsin, what part of his real estate can wife get?—B., Los Angeles.

No. the divorce would not be legal unless the defendant was properly notified, either by publication, or personally. The questioner does not say where the real estate is situated; assuming that it is situated in California, it would be possible for the husband to dispose of community real estate without the wife's signature. Of course, his re-marriage would not be legal unless defendant had been properly served in the divorce proceedings with notice. The question of support is left entirely with the discretion of the court upon evidence of the financial standing and condition of the parties, unless the divorce is for adultery or extreme cruelty. In order to know what part of the real estate the wife would get in divorce proceedings, I would have to know the grounds upon which the divorce was sought; the state in which the real estate is situated, and the amount of property owned by each spouse, as well as what part of it was separate and what community property.—E. L. P.

Laying Hens, Pullets, Cocks, Cockerels, Etc.

700 to 1000 on hand daily. Right now is the time to get the best birds at the lowest prices as we wish to close out a few hundred before the fall rains come.

Write us for prices, STATING EXACTLY what BREEDS you are interested in and how many you need, and we will make you the lowest possible price. We ship everywhere and mail free a 32-page catalog and price list to all who ask for it.

Our prices are changing and will have to be made in writing on anything you wish in grown chickens. We are hatching and shipping many kinds of BABY CHICKS every week at present. Write today and tell us your wants. Largest Baby Chick Dealers in the World; largest fancy poultry yards in Los Angeles.

KOKOMO STEEL WIRE FENCE

Guaranteed to Please

Another of our farm fences. For hog, stock or poultry use. Made of the same special spring steel wire that has made our fencing so popular with all shrewd buyers. Before you buy get our catalog with **net factory prices.** It's free.

CALIFORNIA ANCHOR FENCE CO., MAIN and AURORA STS., STOCKTON, CAL

IT STANDS TO REASON THAT

The BEST Car for the Purchaser, or
The BEST Car for the Dealer, Is

The Car that made the Best Record in the 1910 Glidden Tour

FOR THE PURCHASER

WHY In buying a car you demand a demonstration to see how it runs; how it rides; how it handles and above all **what kind of service it will give. BUT—**

Any new car usually runs smooth—"any new broom usually sweeps clean." What you want to know is: **Will it give lasting service; efficient service; dependable service?** You can't determine this from an hour or two on a boulevard. It takes a test such as the recent Glidden Tour (where every single bolt was subjected to the most **drastic** abuse) to **prove** the things you **ought to know BEFORE** you buy.

FOR THE DEALER

BECAUSE If you are a dealer what better argument can you show a prospective buyer that the car you are trying to sell him will **"stand up"** through thick and thin—rough or smooth—give him the maximum amount of **real dependable** service, than the performance of the 1911 Moline in the recent Glidden Tour.

THE LONG STROKE MOTOR

Affords much **greater power**, especially on low speed; gives greater hill climbing ability; **greater flexibility**; smoother running qualities, **longer life** and a "feel at the wheel" that thrills the driver with a sense of certainty and satisfaction not possible in the short stroke type.

WHAT THE 1911 MOLINE AFFORDS THE BUYER,

The purchaser of the 1911 Moline will get the biggest value in **proved automobile merit** money can buy. He can pay more but he cannot equal the **intrinsic worth** embodied in the 1911 Moline.

This season's model will be built in two styles—**Touring Car and Toy Tonneau**—Five and four passenger, both on same chassis; same specifications. It will have

LARGER ENGINE
LARGER WHEELS
LARGER TIRES
LONGER WHEELBASE
LONGER HOOD
LONGER SPRINGS
MORE POWER
MORE SPEED
MORE ROOM
MORE STYLE

Following are brief specifications. Compare them with others, and you will realize the decided superiority of the 1911 Moline. Then, remember it has proved its merit in the most **critical test** ever imposed on an automobile and won over all competitors.

BRIEF SPECIFICATIONS.

POWER—35 horsepower.
MOTOR—4 cylinder, 4-inch bore, 6-inch stroke, water cooled, thermal circulation.
DRIVE—Shaft drive.
TRANSMISSION—Vertical, selective three speeds forward, one reverse. Full roller bearing.
REAR AXLE—Bevel gear.
FRONT AXLE—I-Beam.
IGNITION—Double independent system.
LUBRICATION — Precision combined with splash system.
CONTROL—Spark and throttle on steering wheel—toe accelerator, muffler cut out.
BRAKES—14-inch double acting.
CLUTCH—Leather faced cone, cork inserts.
WHEELS—12 spoke artillery.
TIRES—3½x36.
WHEELBASE—112 in.

1911 MOLINE $1750

35 H. P. LONG STROKE MOTOR 4 x 6

WILLIAM GREGORY

AMERICAN SURFACE IRRIGATION PIPE

SAVES WATER, GRADING AND TIME

The only scientifically constructed ***Surface Irrigation Pipe*** on the market. No round seams to leak, retard the flow of the water, or weaken the pipe. Cheaper than flumes. Easily handled. ***Will last a lifetime. The correct way to irrigate alfalfa.*** We make Riveted Water Pipe and Tanks. ***Write for illustrated catalogue.***

AMERICAN STEEL PIPE & TANK COMPANY
349 Pacific Electric Building **Los Angeles, California**

Pure

Alfalfa Seed

Good crops cannot be grown from weak or foul seed. Many fine stands of alfalfa have been ruined by the love vine and dodder that was not removed before sowing.

We have installed an alfalfa seed-cleaning machine that insures absolutely pure seed, and our stock is selected from only strong and healthy fields.

Germain seeds are not always cheapest in price, but you will surely get a dollar's worth for a dollar and be certain of the quality.

Germain SEED & PLANT CO.
LOS ANGELES

BUY SEEDS BY NAME

If you were buying apple trees you would rather pay a reasonable price for named varieties, guaranteed true to name by a nurseryman than to buy unnamed trees just because you could get them cheap. Did you ever think of the fact that this same argument applies to seeds? Branded and guaranteed seeds are the safest and in the end the cheapest. There must be quality in every package, for the maker must make good goods or he can't stay in business. When you buy Lilly's Best Seeds, Northern Grown, you buy seeds that are true to name, pure and of high germination.

Don't take chances. Send for catalog. **CHAS. H. LILLY CO., SEATTLE,** for over a decade the leading Seedsmen of the Northwest. No matter where you buy, ask and insist on Lilly's Seeds, and if your dealer does not sell them write to us and we will supply you. Lilly's "Crop" Book is of great interest to farmers. Free

LILLY'S SEEDS

New High Grade Automobiles

at Prices Lower Than the Price of Medium Grade Cars

To Prospective Automobile Buyers:

You naturally wish to purchase the highest grade car you can get for your money, and you naturally want a higher grade car than the dealer can afford to sell you for the amount of money you wish to pay—we will meet your views for a short time.

We have a limited stock to dispose of—all high grade—and all prices to meet the needs of moderate priced car buyers.

Whiting, Davis and Westcott Cars
in Two and Five-Passenger Models

These are not shopworn cars, they have never been driven a mile, and are the latest models received.

We have sold the lease of our garage and have not at present the necessary equipment and room at our store to properly handle automobiles, so we offer you the opportunity to buy a car of higher grade than you ever thought of owning and at a price no higher than is charged for a medium grade car.

Call at Newell Mathews Company, 200 North Los Angeles Street, Los Angeles, Cal., or write us, stating whether you wish to buy a one-seat or two-seat car and we will send you full information or have our salesman call.

Newell Mathews Company

General Agriculture

LOS ANGELES AGRICULTURAL HIGH SCHOOL.

Of the many high schools in the city of Los Angeles its Polytechnic is its pride and the peer of any school of its kind in the world. In common with other cities of this state its educational features have been given the best attention. More recently, in fact within the past two years, its high school located at Gardena, which though still within the city limits is in a purely agricultural section, has been converted into an agricultural school. Small fruits, poultry, and in fact all lines of intensive gardening are given full sway in that locality. When the adding of agricultural courses to the high school was contemplated a tract of land of a dozen or more acres was purchased. Many of the patrons of the school encouraged the departure and a liberal proportion of the attendance took the agricultural course. Regarding the work of the school Mr. F. H. Bolster in charge of the agricultural department last year, has furnished us the following information.

"The school board has spent on other work enough to make $20,000. The school has just completed over have a mile of irrigation pipe at a cost of $1563. It is a high pressure concrete line and one of the finest pieces of work of its kind in Southern California. This line has an adequate number of alfalfa and orchard standpipes and the water supply of the farm, the nurseries, school gardens, and school building has been properly provided for.

"It has a fine team of ranch horses, farm tools of the right kind, and a regular farmer is employed to do the heavy work of the farm. The school farmer lives in the farm house on the school farm.

"This school farm is primarily for the purpose of instruction and experiment. The school should try out new things for the benefit of the community. Let the school which is supported by the community prove the value or the worthlessness of these new ideas. It is better for the school to make a failure of a certain thing than for a number of individuals to do so.

"For example, three acres of alfalfa were put in last year. One acre was common alfalfa, the seed of which cost eighteen cents per pound; one acre Turkestan; and one acre Arabian. The seeds of each of the last two sell for thirty-five cents per pound when they can be obtained, and few farmers will run the risk of putting them in unless they know them to be better than the common kind. One-half of each variety was inoculated and one-half not. They were all put in at the same time under the same conditions and are so arranged and labeled that any man driving past can see for himself how the different kinds compare.

"The school is trying to develop a corn resistant to the corn worm and has planted seed furnished by the government which is already partially resistant. While corn is not in general a paying crop in California its highest possibilities have not been reached. We want the best producer and the one in every way best adapted to the section.

"The fact that any crop is not best adapted to Gardena is no reason why it should not be considered at all. Such a view would imply that the influence of the school would never extend beyond the limits of the community. The boys and girls who get their training here may go out to farm in the great valleys of the West or even into the wheat fields of Canada, so the foundation must be broad. And yet most careful attention should be devoted to those things adapted to the locality.

"Teaching by doing is the motto of the school and yet the pupil who comes here can not spend all his time in farm work. He must have some theory and there are other subjects such as mathematics and history and English which he must study also if the school is to turn out men rather than mere workers. In the work in sloyd the boy will learn how to make a manger or an outbuilding by making it, and at the same time he will be taught how to make certain things for himself as before.

"The garden work is graded. The first year the seeds of all gardens are the same and of easy culture. These are dwarf sweet peas, centaureas, nasturtiums, poppies, zinnias, turnips, lettuce, radishes, beets, beans, carrots, tomatoes, twelve-foot rows of each kind.

The second year along with agricultural botany the garden work is made more difficult. The individual plots are the same size as those of the first year and each pupil raises plants of a different family. Most of the seeds, too, require special culture. This year more than a hundred and thirty different kinds of plants were cultivated on the botany gardens.

"The third year gardens are a grade higher. Each pupil may make of his garden a fertilizer test plot or try different methods of raising a single kind of plant or experiment along any line which meets with the approval of his instructor.

"In the class room elementary agriculture is taught by experiment under the name of General Science. The second year work is Agricultural Botany. Next year Horticulture will be added to our course of study. The plan is to add at least one new course in agriculture a year."

The present instructor in agriculture is Mr. Clayton F. Palmer, who is now just beginning his first year's work.

BETTER AGRICULTURAL METHODS.

A nation which can count a harvest by billions, it might be supposed, would be prone to imagine that it is already practicing good enough agricultural methods.

But we imagine that when the banks are all repaid their loans to farmers to move their crops and profit and loss accounts are closed the per capita net earnings of our great agricultural population will not be wholly satisfied. When, too, the average yield per acre for each of our products over the entire country is compared with the yield in other countries, we are quite sure that convincing proof will be supplied that we as a nation are prodigal and wasteful in the extreme in farming.

To illustrate: The United States produces an average of 88 bushels of potatoes per acre, and the farmer who grows 300 bushels is justified in boasting of his skill in agriculture. Crowded England often raises 1,000 bushels to the acre, and still more crowded Belgium, with over 500 persons to the square mile, can often show 1,600 bushels to the acre. What is here said of potatoes is equally and strikingly true of all other land products. So that our Agricultural Department has sent a commission to Europe to find out how they do it.

The principle upon which European farmers work is that of paying due regard to the cost of production. That is all that intensive farm methods mean—getting the most possible out of an acre of land with the least possible expenditure of money. It is necessary to emphasize the word "money" for there is a system of farming which obtains in all countries that consists in getting the most possible out of an acre with the least possible expenditure of labor, time, investment, or care. If that is farming at all, it is not intensive farming, but the most expensive kind of farming.

Now and then we are told that the American farmer will soon have exhausted all the natural fertility of the land, and that he must come to intensive methods. That warning is uttered as though it were some impending calamity or fearful alternative.

It is not necessary to wait until the fertility of the land is exhausted before adopting intensive methods. All can commence tomorrow morning. And absolutely nothing else can be conceived which will contribute so much and so quickly to the national and individual wealth as will a radical reform in the direction of more scientific and businesslike methods of agriculture and horticulture.—Washington Post.

THE FARMER LAD TOMORROW.

Perhaps no axiom is more steadily overworked than the one that says: "The prosperity of the nation is in the hands of the farmer." Secretary Wilson has repeatedly expressed this view, and early in this year he quoted figures to prove it. He says: "The farm value of all farm products of 1908 reached the most extraordinary total in the nation's history—$7,778,000,000. This is about four times the value of the products of the mines, including precious metals and mineral oils. * * * During the latest ten years the wealth production of the farms of this country has exceeded the fabulous sum of $60,000,000,000."

Taking these figures as a basis, it is easy to see that the American farmer is collectively a mighty factor, possibly the mightiest factor, in the world of finance. Does he know it? If not, why not, when all others are having it dinned into them?

The fact is that the coutry boy has not yet been made aware of himself, of his dormant powers and his special privileges. He has seen that his father, so potent in his collective form is, taken singly, over-worked and under-paid, discriminated against in legislative bodies and snubbed in social ones. He observes that he and his brothers are put to school in poor school houses, under poorly-paid teachers and for short terms, and that the small schooling is so carelessly considered as to tend to fit him for city professions rather than for his career on the farm. What he learns of rural life he learns by the hardest knocks and with the least inspiration from the school room.

The country boy of today, fresh, quick, industrious and observant, is beginning to discover himself. He has traded, dug, hunted, teamed, felt in a hundred ways the pulse of victory, and learned the lessons of failure. He has acquired the conviction that one can excel only by having greater capacity for work and self-training. He has learned that to put personal comfort before duty is to miss the final victory. It will be hard to keep such a boy down.

Heretofore when he has waked up he has gone to the city to express himself, returning generally at the close of life, and wearing his laurels, to the farm. But the young farmer of today does not mean to go to the city to express himself. He means to stay on his own broad acres, carpeted with blue grass and dotted wth well-bred stock of all classes. He means to buy a furnace, bath-room fixtures and an acetylene-gas machine. He means to line the wall of his library with bookshelves and to have the rural free delivery bring him the daily papers, magazines and market reports. He intends to be a factor to be reckoned with in county, state, and national matters.

One other thing he clearly means, and he means it very emphatically: He means to see to it that the county boards of education understand why they were created, and that the school house shall be run for the people by the people. It is not his intention that an offer of some $8,000 for the erection of a modern model consolidated country school shall be turned down, as was done in Jefferson Co., Ky., by the county board of education, when two rich men of Louisville, country-born, wishing to express their sympathy with the farm lad and to help on his inalienable right to an education, offered the board this sum for such a purpose. In a decade or less the young farmer, who is now rubbing his eyes and stretching himself, will reckon with officials of this class. Little isolated country schools, so poorly paid as to be prohibitive of any real teaching talent, will be wiped off the map and in their places will rise large modern consolidated structures equipped for education, for organization and social life, with laboratories and lecture halls and club life; and the new scientific education of the country school will deal with agriculture in its varied phases in most inspiring fashion.—Mrs. Fannie Casseday Duncan in Breeders Gazette.

GOPHERS.

For several years I was bothered with gophers killing my prune trees. and I solved the problem of how to stop their destructive work. While my remedy does not kill them, it keeps them away from the tree. I discovered that gophers did not like sulphur, so dig a trench four feet in diameter around the tree six inches deep, and then take a small bellows and blow flowers of sulphur in it. It takes only about a tablespoonful and the cost and labor comparatively nothing. The trench should be filled with the earth again. The gopher will not go inside this circle of sulphur, and it lasts a long time, as by covering it does not evaporate. I do not see why this method could not be used for any kind of tree where the gophers bother much. Thinking this might benefit some of the numerous subscribers to the Cultivator, I send it in to you.—C. J. B. Moore, Calistoga.

"Flour City"
Gasoline Traction Engines

Made in 30 and 40 H. P.
Gold Medal Winner

We have recently sold six of these splendid engines, and every purchaser is highly pleased. One of them was taken a long distance over mountain roads, successfully hauling a load over grades where it was predicted that no traction engine would be able to go. One of them has been handling a large bean threshing outfit, and the foreman is enthusiastic in its praise. One has been put in the field near Los Angeles pulling plows and harrows and is doing fine work.

The "Flour City" has repeatedly won the first prize—gold medal—in competition with leading engines made in this country and England, for plowing more land and hauling a greater load in a given time, with less fuel and water consumption than any other engine.

These engines have points of superiority that are at once apparent. The extremely high wheels give great traction power and steadiness, while the four-cylinder motors being arranged vertically give an absolutely steady pull on the draw bar. It is extremely easy to handle.

Don't compare the "Flour City" with any other gasoline traction engine you have ever seen. It is in a class by itself — an absolutely reliable, dependable, economical, and powerful traction engine.

Write Us for Description and Prices

We are also dealers in everything for the ranch--John Deere engine gang plows, Deere plows, harrows and cultivators of all styles, Farmer's handy trucks, Feed cutters, alfalfa mills, Grain Drills, Fertilizer Drills, harness, carriages, automobiles and power wagons.

FARM LANDS FOR SALE.

Owens Valley Lands—Those who have written us regarding our lands, we wish to advise that the railroad is now completed and that the cost and time of going into the Valley is greatly reduced. Instead of an expense of $30.00, you can make the round trip, spending two days on our land and seeing the country thoroughly, for a total cost of $19.00, which will be refunded to you in the event you purchase. We urge upon the California farmer, who is considering a change of location, not to waste any time in investigating Owens Valley. The possibilities of this wondrous district are far beyond anything in California. It is not necessary for us to use bumper crops of one successful farmer to tell of the wonderful resources of this Valley. From 250 to 500 bushels of potatoes, from 60 to 90 bushels of corn is the general run. The choicest apple districts of Oregon, Washington or Colorado are not one bit superior to Owens Valley, where you can buy today the very best foothill apple land we have, with a perpetual water right, in steel and concrete mains, at $150 per acre, while the same land in the Northern States would cost you $600. There is no experiment about the Owens Valley as an apple country. The trees have been there for 40 years. Expert apple orchardists from the Rogue River, who examined the land in the Owens Valley this summer, contend that their former home never produced Wine Saps and Spitzenburgs equal to what they saw. The climate in Owens Valley is superior to anything in California, outside of the seashore. The hottest day in nine years was 102 deg. This last summer the thermometer ran to 100 deg. on two occasions. The winters get as low as 10 deg. above, but all farmers contend they work in their shirt sleeves all winter, the cold period only being in the early morning. You should write this office and let us send you an assortment of pictures, maps and complete descriptions. Our printed matter will give you a very complete story of all the conditions in the Valley. The man who lost his opportunity in buying Southern California lands when they were $150 an acre has the same opportunity awaiting him in Owens Valley. If you are in the city, do not fail to call at our office and see the exhibit of apples, corn, onions, potatoes and all grains, which you will acknowledge are superior to anything you believed California could raise. Owens Valley Improvement Co. James R. H. Wagner—H. S. Cook, Sales Agens, Room 13, 329 South Hill St., Los Angeles, Cal.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

For Sale—815 acres in San Luis Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. Forty acres of land suitable for these. Price $21 per acre. For further particulars apply to Mrs. F. A. Clink, Pozo, Cal.

For Sale—5-acre chicken ranch, ¼ mile from Petaluma, 5-room house, brooder house, windmill and tank, all new. Fine well of water, also fine view of surrounding country. Cow, horse, wagon, and 900 laying hens go with place. Net income last year over $1,000. Price $4,500, if taken before the first of January. Call or address A. B. Smith, Bodega Ave., Petaluma, Cal.

For Sale—At Corona, 12-acre lemon grove. This is a lovely grove, only one mile from town; lots of water, very best of soil; trees about 12 years old. This grove is worth one-third more than price asked. See owner, R. S. Smith, 502 O. T. Johnson Bldg., Los Angeles. Phone Main 2495, Hollywood 3128.

Tulare Co.—$35.00 per acre for short time. 80 acres level alfalfa land, 4½ miles from town and railroad. Unlimited pumping water at 14 ft. Electric power available. Terms, ½ cash, balance 1, 2, and 3 years at 7 per cent. Adjoining land improved. C. H. Biggin, Pixley, Tulare Co., Cal.

Irrigated Land—The famous Gridley Colonies. Improved lands, best homeseekers' proposition in California. Write for particulars. Gridley Land Co., Gridley, Cal.

For Sale—Fresno County, California, 10 acres vineyard, Missions, Sultanas and Emperors. Rich soil, no hardpan or alkali. Riparian water, price $2,500, terms. Statham, Box 78, R. R. 2, Sanger, Cal.

For Sale—El Cajon Grant Land. Virgin soil, 4 miles to railroad, good farm land at $30 to $60 per acre. S. B. Hawley, 1548 D St., San Diego, Cal.

The Best Buys in farm lands in Central California can be had through us. Call or write Sterling Securities Co., Savings & Loan Bldg., Stockton, Cal.

For Sale—In Sutter County, California, choice fruit and alfalfa farms, 10 to 40 acres. E. L. McCune, Yuba City, Cal.

Irrigated Land For Sale, Cheap—In the Lower Rio Grande Valley of South Texas. Ideal climate. Good markets. Large crops. Special inducements to several practical irrigation farmers. Address Manager, American Rio Grande Land & Irrigation Co., Mercedes, Hidalgo County, Texas.

For Sale—240 acres of good land in Mariposa County; 50 acres clear, balance easily cleared; suitable for a hog ranch, grain or apple orchard. Plenty of water; 3 miles of good fences; good buildings. Price $2,200. For further particulars, address C. Gliszinski, Los Angeles, Cal. Gen. Dely.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

HORTICULTURAL PRINTING.

The Kruckeberg Press, 123 South Los Angeles St., Los Angeles, Cal., makes a specialty of Horticultural Printing and Engraving. Cuts and illustrations of all standard, economic and ornamental plants on hand and subject to the use of patrons without cost. Samples and estimates cheerfully furnished. Remember, we design, write, engrave, bind and print; in brief, do the "whole thing," at no additional expense to the customer. Correspondence a pleasure.

POULTRY.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal.

Hayes, R. B., Poultry Fancier and Rhode Island Red Specialist—30 breeding pens of Reds, 20 pens miscellaneous varieties. See our birds, they tell their own story, or write for circular. Eggs for sale only. Yards in Arroyo, opposite Ostrich Farm. Box 35, Garvanza Sta., Los Angeles, Cal. Phone East 1631.

Milk Coolers, Bottles, Caps, brushes, Buhl milk cans, Sharples separators, Babcock testers, veterinary instruments, wood soled boots and shoes, and our celebrated "Prosperity" washing powder. Guy F. Kelsey, 108 E. 8th St., Los Angeles, Cal

Business Notes

SPECIAL FOR WESTERN USE.

A feature of notable importance is the rapidly increasing popularity among the users of wire fencing of the Kokomo Steel Woven Wire Fence, distributed by the California Anchor Fence Co. of Stockton, California. This company is new supplying a large portion of the fencing used by the shrewd buyers and those who can judge a practical fence. The Kokomo Fence, incorporates in its make-up a special class of spring steel wire, which produces a fencing of far superior durability and lasting qualities than is found in the ordinary fencing. It is also being adopted by many of the railroad companies, as well as large land owners. Among those recently furnished, being the electric line from Stockton to Jenny Lind, California. This company issues an illustrated catalogue to enable its patrons to make a selection of fencing, and mail same, together with net factory prices, on receipt of application to the main office, Main and Aurora Sts., Stockton, California.

BLIGHT RESISTING WALNUTS.

Several letters recently appearing in the Cultivator tend to show the increasing interest in the growing of walnuts as a commercial crop in Northern as well as Southern California. In the answer to one correspondent on this question it was stated that no variety had been found that was completely resistant to the blight. What constitutes complete resistance would be hard to say. As a matter of fact, however, the Concord has been growing and bearing nuts for nearly twenty years in Contra Costa county, amongst all other varieties, and has never blighted. The San Jose Mayette has the same record over a period of twelve years in San Jose.

Any who are interested may visit the large orchards of Mr. Ely I. Hutchinson of Concord, and judge for himself, or he may investigate the claims made for the Wiltz or "San Jose" Mayette at the orchard of Rudolph Wiltz, San Jose, or the writer will send samples of these nuts to any who would like to test them.—Leonard Coates, Morganhill.

A COMMUNITY HORSE.

Messrs. J. Crouch and Son, of Sacramento, importers and breeders of thoroughbred horses, have a very commendable plan whereby their horses are sold on shares. Every community can now own a fine Belgian or Percheron stallion. While the prices are too high for individual purchasing the community plan should meet with general favor as it gives the several owners the service privilege, improves the stock and reduces the cost.

Farmers' clubs, stock associations, and others interested in high grade horses should write for full particulars.

MODERN FARM HORSE.

Possibilities of profitable farming have been greatly increased by the introduction of the gasoline traction engine. Low in price, efficient and practical, this improvement, which has been called the "modern farm horse," has increased the capacity of every farm. If that portion of the farm which has been used to support farm stock can be used to increase profits, the farmer's difficulties will be lessened. One of the very best of these traction engines is that manufacturd by the Hart-Parr Co. of Iowa. Mr. O. A Jones will give California inquirers fullest information if he is addressed at 131, 133 North Los Angeles Street Los Angeles.

Household Department

THANKSGIVING.

Hushed as the silence that follows praise
Is the mystic peace of the autumn haze,
That soft and mellow and touched with gold.
Wraps hill and vale in its lustrous fold;
Here and there by the sunshine kiss'd
To violet, amber and amethyst,
Or blown by the breath of the breeze away
From the meadows shorn and the woodlands ray.

We've heard the last of the wild bird's call,
We've watched the loose leaves flutter and fall;
There are empty nests on the naked bough,
There's a dream of snow on the mountain's brow;
The summer's work is over and done.
And the brown fields sleep in the waning sun;
Fruit of the harvest is gathered in.
And grain is heaped both in barn and bin.

And up from the homes that are richly blest,
Dowered with abundance and crowned with rest,
And up from the hearts that in highest mood,
The lowest bow in their gratitude,
Anthems arise to the Giver of all,
Whose love beholds if a sparrow fall—
Whose matchless grace on the earth hath smiled,
Like the parent's look on a cradled child.

From near and far as the household bands,
Cluster and clasp in the best of lands,
That aye in the wash of the silver sea
Hears the lofty music of liberty.
That still where its mighty rivers flow.
Sees peace and learning and progress grow—
From near and far to the God above
Are lifted the strains of a nation's love.

And even from those who must sit apart
In the glimmering twilight of the heart,
Whose hopes have faded, whose dear ones lie
With pale hands crossed 'neath the autumn sky,
Because there is healing after strife,
And a conquering faith in the better life—
From the sad and the worn, as the last leaves fall,
There ascends a psalm to the Lord of all.

—Margaret E. Sangster in Harper's.

THE TIME FOR THANKS.

Gratitude is an old-fashioned word, seldom mentioned in these days. Even the professional doer-of-good, working in the slums, no longer expects it as a reward, and so far from looking for it on the part of our children, the modern attitude toward them seems to be one of apology. They have a right to expect so much more than we are able to give!

Still, when the harvests of the year are all in, the jostle and turmoil of election well over, and a lull has come in the strenuous pressure of a work-a-day world, honoring an old custom we take a day for rejoicing in our various goods and giving thanks. A national Thanksgiving implies a people still alive to the sentiment of the grateful heart.

A time of thanks may well suggest the kind of result that we ought to work for and expect, and a general estimate of our own advance in the path that we have chosen. It is a good time for looking backward and forward and keeping a tally on our own efforts and aims. If we are going steadily in the right direction we may well be thankful for every foot of progress. We have heard a great deal recently in public addresses and appeals of a moral awakening, a quickening of the conscience in governmental and industrial relations, a new sensitiveness in the common mind to questions of right and wrong. In so far as this is a real movement or tendency, it is surely ground for rejoicing for every right-minded person.

The common good is now the shibboleth of both parties, and we are called upon to trust in this or that man as a model of devotion to the best interests of the people. How is this service to the public to be made a practical reality? It can only be through individual, disinterested effort. Every man (and every woman, too) ought to realize that the whole work in life, to be acceptable—acceptable to ourselves, first of all—must be in its actual result beneficient. This rule holds good in all stations and for all kinds of work. The sum total must be something useful, valuable, helpful to the community. A carpenter or a lawyer or a president must make his work felt for good in some real way to be "a desirable citizen." This motive ought to be built into the character of every child. It would help immensely in making a true estimate of the value and attractiveness of the various callings open to the young. It would help to counteract the immense and demoralizing power of money as an object.

The victory of the higher range of aims and motives over the lower is slowly won; the world will not be converted to noble living in a day. The so-called reforms are often merely another device of self-interest, and sweeping novelties in government are urged in the misleading hope of getting something for nothing. The new methods proposed are mostly showy, untried experiments. Not one of them is likely to change the human heart by eradicating greed. Is it not true, rather, that this over-weaning self-interest is at the bottom of much of the industrial unrest and the passionate demand for a more general division of the profits of all large enterprises? Indiscriminate abuse of the rich and exploitation of the virtues of the working man are not in the interest of the common good. A rich man is neither better nor worse than a poor man per se. For both, justice and kindness and common honesty between man and man command confidence and respect. When we put these qualities before our minds as objects that give a new and more serious value to life, we see things in different proportions. Public control of public utilities may come in the future, but if it is a great gain it will be on account of higher standards in individual man. The good of the many must be truly accepted as preferable to the enrichment of the few.

The Thanksgiving festival surely belongs in an especial manner to the farmer and the farmer's family. He is "the man who feeds the world"—

Mayer
MARTHA WASHINGTON
COMFORT SHOES

Sensitive, feverish, aching feet get lasting relief from Martha Washington Comfort Shoes. They fit like a glove and are as easy as a stocking. No buttons or laces—just complete and lasting comfort.

Oakland's New Engineering College

THIRTEENTH AND MADISON STREETS

Polytechnic College to Have Elegant Building and Equipment

The magnificent new re-enforced concrete engineering building of the Polytechnic College, at 13th and Madison Sts., Oakland, is nearing completion. This new and modern building, together with extensive equipment, will give this college superior facilities in all departments of engineering work. This institution appeals to young men who wish a high-grade course in all the essentials, but who cannot spend four or five years in college.

Contracting and Practical Work

The crowning feature of the Polytechnic College of Engineering is in combining practice with theory. It is, perhaps, the only school in the United States that engages in actual engineering and construction work, and gives its students actual practice while pursuing their courses.

Complete courses in Civil, Electrical, Mining, Mechanical, Hydraulic, Gas and Steam Engineering; also in Architecture.

without him all other undertakings for pleasure or for gain would be cut short indeed. That his work in its large aspect is necessary to mankind and in the interest of all civilization and progress is self-evident. That it brings him close to nature in her beauty and in her power, and that he works in immediate co-operation with her immutable laws, adds an element which means something in the life, even when it is not consciously considered or valued. The living that depends on the sun and rain directly seems to bring us a little nearer to the source of all our supplies. For—

"All the plenty summer pours,
Autumn's rich o'erflowing stores;
Flocks that whiten all the plain;
Yellow sheaves of ripened grain:

* * *

Bounteous source of every joy
Let Thy praise our tongues employ!"

If life were all a matter of earning and spending, all the toil imposed by the instinct of self-preservation, it would be but a sorry gift for which to give thanks. Life itself, with all its wonderful possibilities, the sweetness of the home ties and the hold upon things infinite and divine, must be put before those material things which perish in the using. These are never more than means to an end. The sane, cheerful view of life that helps us to take its joys happily and its sorrows and difficulties hopefully is itself something to be thankful for. If little personal trials and vexations do not disappear, at least they seem smaller when we take a broader view, and think of our lives with reference to our best human opportunities. As a fighting ground and scene of perpetual strife it is, perhaps, a question how far we are raised above the level of wolves and tigers. It is character alone that gives man his preeminence.

It is true now, as it has been from time immemorial, that man can always win his bread from the earth by the toil of his hands. Every man who lives on his own land can find, if he will, that this privilege gives a certain superiority over the claims and demands of commercial interests. We are all mutually dependent, in a very real sense. But this does not lessen the value of that sturdy quality of personal independence by which a man not only thinks for himself, but sets the standard and aim of his whole scheme of life, in accordance with his own estimate of what is best worth while as an object of pursuit. In practical things the farmer has an independence that is also very real. He can afford better than those dependent upon capital for employment to take the highest ground in politics and in morals. He can and should demand in the interest of public service, that the men who hold trusts must be above criticism in their private life, men of high character and unquestioned integrity. To be conscious of unselfish aims means too, to believe in the possibility of unselfishness in others and to have a sense of the need of a loyal support to those carrying great responsibilities. All the social virtues depend on a keen sense of moral obligation. With it, the men who live plainly and work hard are the backbone of the nation.

If we believe in the persistence, through many dangers, of the country which they have made great, it must be because we believe in the persistence of these strong elements of character. For what they are, as well as for what they have received in the year's harvest, the time of the in-gathering may well be a time of profound thanks to the Giver of all Good.—Country Gentleman.

FOR THE THANKSGIVING PARTY.

There is no better form of entertainment at Thanksgiving than an old-fashioned candy-pull and nut party such as was popular with our forefathers and foremothers a century ago.

If possible, there ought to be an open fire-place for the work and for the fun of the evening; but candy may be cooked quite as well, if more prosaically, on a modern kitchen range, and nuts for fortune-telling can be made to burn upon a hot stove-plate.

There should be two kettles, one for the local nut candy, and one for the molasses taffy which is proper for a candy-pull. If not sufficiently cooked, it will not pull. If cooked too much, it hardens on the dish, and is spoiled for genuine taffy.

Then the pulling, which is the event of the evening. The young folks choose partners, a boy and a girl together, and there should be much rivalry as to who will do the work best, and make the prettiest batch of candy.

Telling fortunes with nuts is as old as primitive man. The ordinary method is to take two nuts—hickory or shellbark by preference, with chestnuts as a second choice—and, naming one for an unmarried woman, the other for an unmarried man, place them side by side upon the smooth hearth in front of a hot fire and watch the result of the heat upon them. If the nuts burn steadily together until consumed, the omen is that of a happy marriage for the two people whose names they bear. If, on the contrary, the effect of the fire is to drive the nuts apart, the love affair will never amount to anything.

In setting your Thanksgiving dinner table, always think of the comfort of your guests. Sweep and dust your dining-room right after breakfast and air it well, so that it may not be "stuffy." Look out for the temperature of the room, and see that no guest will be placed in a draft. Don't let the centerpiece or the lamps or the candles, provided you serve the dinner at night, be so high as to obstruct the vision.

As a usual thing, the Thanksgiving dinner is served, according to tradition, in the early afternoon, in which case artificial lighting is not necessary.

Do not overload your table with a multiplicity of small dishes. Have a pretty and artistic centerpiece of fruit or flowers. Fruit for Thanksgiving is especially appropriate. If you have an old-fashioned silver cake-basket, arrange the fruit on that. Have apples, red and green, polished till they shine like mirrors, bronze and ruddy pears; white and purple grapes and golden oranges.

If you have no silver dish or burnished copper tray, such as many housewives are now picking up in the Russian quarters of our large cities, "put them in a pumpkin shell," or one of Hubbard squash. Cut these in halves, scrape out the inside, line with a paper napkin or piece of tinfoil, train a bit of vine or sprays of autumn leaves over the edges, and

you have a jardiniere of beauty that could scarcely be improved upon.

Here are some suggestions:

Stuffing for the Turkey.

The stuffing for the turkey can be varied to suit the taste and predilections of the family. For those whose memory needs jogging, the following recipes may find appreciation:

Chestnut Stuffing.

For stuffing, use either the large imported chestnuts or the home-grown nut. The latter takes longer to prepare, because it is so much smaller that it is necessary to use three or four times as many as of the large foreign nuts. For a simple stuffing, shell and blanch about a hundred good-sized American chestnuts, then cook for half an hour in water to cover. Drain, mash the nuts and add to them three scant tablespoonfuls of butter, a level teaspoonful of salt and a third of a teaspoonful of pepper. Mix lightly, adding, if desired, a little minced onion and finely-chopped celery, and stuff. This will be sufficient for the average turkey. Reduce proportionately for smaller fowls. A rich dressing can be made by adding to the chestnuts a cupful of finely-chopped veal, chicken or mutton, with parsley and other seasonings if desired.

Walnut or Hickory-Nut Taffy.

Place over the fire in a kettle three pounds of sugar and one pint of water. When the sugar is dissolved, and the syrup comes to a boil, add half a teaspoonful of cream of tartar and cook to the crack degree. Spread in a buttered pan a pound and a half of shelled nuts, hickory or walnuts. Pour the boiling candy over them and, when cool, break in pieces.

Peanut Brittle.

Cover two cupfuls of granulated sugar with water, place in a clean pan over the fire, and stir constantly until quite brown. Add a cupful of chopped nuts, and pour into a buttered pan to cool.

Peanut Brittle, No. 2.

Shell and skin peanuts and strew the bottom of a greased baking-pan thickly with them. Boil together one cupful each of brown sugar and molasses, and add a tablespoonful of vinegar and two of butter. Cook until brittle when dropped in ice water, and pour over the nuts.

N. O. Pecan Pralines.

Add to two and a half cupfuls of water eight cupfuls of sugar and let come to a boil. Cook until it ropes, then add eight cupfuls of chopped pecans and stir until cool. A few drops of vanilla may be added if desired.—New Idea Woman's Magazine.

PERFECT PUMPKIN PIE.

One of the poorest of all dishes is a pumpkin pie which is not what it ought to be, and one of the best is a perfect pie. The trouble is that in making it the ingredients are not rich enough; thick cream and plenty of eggs are really essential to its composition. This recipe is very nice: Get a small pumpkin and cut it up without peeling it; put it into a covered colander and steam till soft, and then remove the peel; put it into a dish in the oven and leave the door open till it is dry, but be careful not to let it grow brown or bake. Press it through the colander and measure; to two and a half cups of pulp add two cups of cream, or very rich milk, one teaspoonful each of salt, butter, cinnamon and ginger, a tablespoonful of molasses, sugar to taste, and, after cooling and beating well, two well-beaten eggs, or the yolks of four. Make a rich pie crust, and line an extra large and deep tin, and leave an edge on top; pour in the pumpkin, bake slowly forty minutes, or a little more, till there is a good brown crust on top; serve very cold, and all around the edge put large spoonfuls of thick whipped cream—a modern idea, but a great improvement on the old-fashioned plan.

ORIGIN AND HISTORY OF THANKSGIVING DAY.

The first day of Thanksgiving on this continent was appointed by Governor Bradley of the Plymouth Colony, in September, 1621, after the first harvest in the New World. The first national Thanksgiving Day in the United States was proclaimed by Washington, at the request of Congress, November 26, 1789, to commemorate the establishment of a form of Government. Madison issued a proclamation in 1815 to commemorate the close of the war with Great Britain. It became an annual event when Abraham Lincoln appointed the last Thursday in November, 1863, as "a day of thanksgiving and praise."

In arranging the table for the Thanksgiving dinner, remember that it is a time of abundance and it will not be so much out of the way if the table does look somewhat crowded. There is nothing makes a prettier and more suggestive center piece than a good sized pumpkin cut into the shape of a basket and then filled with chrysanthemums. These flowers are not necessarily used, only that they are November's own flower. Any greens or flowers look well. The pumpkin filled and overflowing with fruits makes just as desirable an arrangement.

GIVE THANKS.

Give thanks, dear heart; give thanks to everyone
Who meets you with brave word and clasp of hand;
Give thanks for the sweet air, the morning sun,
The plenteousness that fills the pleasant land—
Light in the lover's eyes, souls that can understand,
Oh more than all for love—love that endures,
For all the love, dear heart,—that may be yours,
Give thanks.
Love bounds the whole, from day-dawn to the dream;
The blessed gift of life is Love Supreme.
The human soul secure in this, outranks
All word-creation else; to see and know
The sign will in the deed the purpose show—
Thus wise, dear heart, give thanks.
—E. C. T. in San Francisco Star.

DAINTY TOAST.

Try this for an invalid whose appetite needs coaxing: Toast a slice of bread, dip it into a small quantity of hot water to which has been added a generous piece of butter. Remove from water, pile on top of toast the beaten white of an egg, placing the yolk squarely in the center. Salt slightly and set in a hot oven until the egg is firm but not hard.

"He who thanks but with his lips
Thanks but in part;
The full, the true thanksgiving
Comes from the heart."
—Shedd.

"He who waits for Thanksgiving Day to be thankful, will not be thankful when it comes."

Hay.

Arrivals of hay on the San Francisco market for the week have amounted to 4250 tons. The arrivals last Monday morning on the Southern Pacific railroad alone were 127 carloads, which we believe to have been the heaviest arrivals by rail that we have ever received at this time of the year, on any one day.

General trade conditions have not noticeably improved in any direction. The only hay that is at all in demand, or that can be satisfactorily placed are the fancy types of wheat, or of red oat hay.. The bulk of the hay that has been arriving during the past few weeks has been marketed here on a basis of from $10.00 to $11.00 per ton on the tracks here.

The hay association report on hay will be issued in a day or two, and it is expected to show even a larger body of hay on hand than was accounted for on the 1st of November, 1909, at which time there were 258,570 tons. Unless something unexpected develops that cannot now be foreseen, it will be impossible for our markets to consume this vast quantity of hay before next season's crop, and therefore nothing can be seen in the present situation to lead one to reasonably expect any better prices than at this time prevail.

We quote the wholesale prices in round lots on today's market as follows, viz:

Fancy wheat	12.50@13.50
No. 1 wheat or wh and o	10.50@11.50
No. 2 wheat or wh and o	9.00@10.00
Choice tame oat	10.50@11.50
Other tame oat	8.00@9.50
Wild oat	8.00@9.00
Stock hay	5.50@6.50
Alfalfa	9.00@12.10
Straw	40@50

Grain.

Wheat, No. 1	1.37½@1.42½
Barley, fancy	1.01¼@1.02½
Barely, good to choice	98¾@1.00
Barley, poor to fair	92½@97½
Oats, white	1.45@1.55
Rye, new crop	1.47½@1.52½
Alfalfa seed	18@20
Mustard brown	4½
Millet	2¾
Flaxseed	5@5½
Broom corn seed, per ton	23.50

Feed Stuff.

Bran, per ton	29.00@31.00

Cracked corn	35.00@37.00
Ground barley, per ton	22.00@23.00
Rolled oats, per ton	29.00@31.00
Middlings	34.00@36.00
Oil cake, per ton	40.00@41.50
Cocoanut cake, per ton	25.00@26.50
Mixed feed, per ton	24.00@27.00
Shorts	30.00@32.00

Deciduous Market

SACRAMENTO, November 12, 1910.

The following circular of the California Fruit Distributors gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, November 11th, 1910:

Grapes:. 171 cars.

Grape movement has continued practically the same for the last seven days as during the preceding week. It is difficult to estimate the quantity still remaining in the state, but it will probably run somewhere from fifty to one hundred carioads.

Weather:

While there have been a few light showers in various places in the state, not enough rain has fallen to interfere with shipping. Another week will practically clean up the crop.

Citrus Market

LOS ANGELES, Nov. 16, 1910.

The temptation to crowd the season has induced the shipping of a lot of green oranges. This has resulted in rejections which have later been picked up by other dealers at low prices. These are not disastrous, but run in the neighborhood of $1.75 and $2.00 f. o. b. California points. It is probable the later holiday shipments will be colored up so as to meet with a better reception. There are a few Valencias in storage which are commanding good prices and ready sales.

Some of the finest lemons ever cut are now being sent. The fall and winter cutting will be rather heavy which has induced a slight shading in prices. $4.00 and $6.00 f. o. b. quotations are common however.

Shipments.

Total shipments of oranges since November 1st, 1910, 52 cars, of lemons 174 cars, making a total of 226 cars citrus fruits. To same date last season 127 cars oranges, 110 cars lemons, 237 cars citrus fruits for season.

NEW YORK, Monday, Nov. 14.—Eight cars of Valencias and three cars of lemons were sold. The market is steady. Cloudy and cool weather prevails.

YAQUI VALLEY.

The wonderful agricultural possibilities of Mexico have never been fully appreciated until now that some of its rich valleys are being brought under cultivation. One of the richest of these valleys is the Yaqui Valley on the west coast of Mexico in the state of Sonora, about 260 miles south of the American border. In soil, water and products this section offers wonderful inducements to the homemaker. Other factors claimed as vital are good markets, cheap transportation, one of the finest climates on earth, and all at exceptionally low prices. Land hungry people should learn more of this rich section, which they may do by addressing Charles F. O'Brien, 112 West Sixth street, Los Angeles.

AN ABLE AND UNBIASED OPINION.

Prof. Woodbridge, whom everybody here knows, says 1000 lbs. of Nitrate of Soda per acre annually for a hundred years would add to three feet depth of the soil twenty-six ten thousandths (.0026) of one per cent of Sodium, which no chemist can detect. And besides this, practically all crops remove some soda from the soil.

PROTECTION OF FORESTS FROM FIRE.

The problem of protecting the forests of the country from fires is receiving considerable attention from associations of private owners, associations of lumber companies, state forest wardens, and the national government, and the United State Department of Agriculture has just issued Bulletin 82, Forest Service, relating to the subject. In spite of all that has been done, however, probably 60 per cent of the private forests have no adequate system of protection.

There are three classes of forest fires: Surface fires, which burn the surface layer of leaves, dry grass, brush and small trees; ground fires, burning the deep accumulation of vegetable mold; and crown fires, which accompany surface fires and burn the crowns of the trees.

Surface fires are the most common and may start under ordinarily dry conditions. The severity of the fire, of course, depends largely on the amaunt of accumulated leaves and brush and the strength of the wind. Surface fires kill seedlings and young trees, but in many cases do not kill the larger trees Under some conditions they may kill everything in the area which they cover.

Ground fires occur only when the vegetable mold has become thoroughly dry. They burn slowly, but with intense heat, and are exceedingly difficult to extinguish. They have been known to burn all winter, creeping along under a deep layer of snow. Ground fires usually destroy all trees, killing the tissues of the roots, and the trees die and are blown down.

Crown fires almost invariably accompany surface fires and occur only when the woods are very dry and there is a high wind. Usually all trees are killed. Sometimes, however, where there are a great many hardwoods in mixture with coniferous trees, single trees or groups of trees may escape injury.

As the value of lumber and of the forests increases and the necessity of protecting them from fires as far as possible becomes appreciated, the owners and the different organizations controlling the forests are using every means of securing them against destruction by a thorough patrol system, organized fire-fighting squads with tools and equipment for extinguishing fires located at accessible points, by constantly warring against the careless use of fire, and by every other available means. The number of forest guards on the National Forests is inadequate for the work, in some cases a single man having the responsibility of protecting 100,000 acres, whereas in most places there should be at least one guard for every 10,000 aches. Prussia has a guard for every 1,700

California Cultivator Clubbing Price List

FOR THE SEASON 1910-'11

Prices are Good to Oct. 1, 1911

This magazine price list is prepared annually for the convenience and benefit of Cultivator subscribers. The prices given allow our readers the benefit of the lowest figures possible, in return for which, all we require is that to all orders a year's subscription to the Cultivator (class 18) be added at 90c (regular price $1.00 per year).

This year the pricing of various combinations of magazines is a simple matter; all are listed according to class number and this class number multiplied by 5 gives the cost price.

EXAMPLE.

Class Number.		Regular Price.
20	American Magazine	$1.50
16	Delineator	1.00
37	World's Work	3.00
18	Cultivator	1.00
—		

91X5=$4.55. Club price for all. Amount saved on this club, $1.95.

Periodicals in any combination may be ordered to the same or different addresses. Foreign or Canadian subscriptions are extra on account of added postage and prices must be gotten by correspondence. Subscriptions may be either "new" or "renewals," but it is important that this information be given in each case.

Books—Send us a postal for our list of agricultural books which we supply subscribers and which we recommend as most suited to California conditions.

Don't overlook this special:

The California Cultivator (weekly)
The Rural Californian (monthly) } **Both one year for . . $1.50**

Write names and addresses plainly and address all orders to

The Cultivator Publishing Co.

115-117 N. Broadway Los Angeles, Cal.

The price of the Cultivator and any single magazine may be obtained by adding 90c to the class price of the magazine desired.

Make up your orders from the following, noting that the class numbers multiplied by 5 gives the cost price. Also bear in mind that **all orders must include a year's subscription to the Cultivator (class 18) at 90c.** See example on reverse side of sheet.

THE YOUTH'S COMPANION

The Companion has lately added many new features, giving subscribers an increase of reading matter in the year's 52 issues equal to 400 pages of standard magazine size and type, but the quality remains as high, the price as low as formerly.

For the Boys

Expert advice on Football, Baseball and other Sports and Pastimes; Encounters with Indians; Fishing and Hunting Exploits; Handy Contrivances for the Young Mechanic.

For the Girls

Stories of Girls who have made their own Way; Stories of Obscure Heroines; Stories of everyday Girls at Home or in College; Careers for Girls; Useful Hints.

For the Family

Practical Short Articles about the Kitchen, the Parlor, the Garden, the Hennery—everything that can be of help in making home more comfortable, more beautiful.

300
Glorious Stories for Everybody

Stories that hold the interest, Stories of Pluck, Stories of Perilous Adventures, Stories of Athletics, Stories of the Mountains and the Sea.

1000
Notes on what the World is Doing

The most recent of discoveries and inventions, terse editorials, science, mechanics, natural history, politics and government.

50
Popular Papers by Famous Writers

These Papers take one into the workshop and the laboratory, into remote corners of the world with intrepid travellers.

2000
1-Minute Stories, Anecdotes, etc.

These include diverting thumb-nail sketches, odd happenings, bits of biography and history, the best selections of wisdom, wit and humor.

THE CHILDREN'S PAGE—NATURAL HISTORY—WITH THE SCIENTISTS—CURRENT EVENTS—THE DOCTOR'S WEEKLY COUNSEL, Etc.

THE COMPANION ENTERTAINS EVERY WEEK HALF A MILLION AMERICAN FAMILIES

All the Remaining 1910 Issues Free
How to Get Them

EVERY NEW SUBSCRIBER who cuts out and sends this slip (or mentions this publication) with $1.75 for the 52 issues of The Companion for 1911 will receive

FREE

All the issues for the remaining weeks of 1910, including the beautiful Holiday Numbers for Thanksgiving and Christmas.

FREE

The Companion's 1911 Art Calendar, lithographed in twelve colors and gold.

Then The Youth's Companion for the 52 weeks of 1911, equal to the contents of twenty-seven 300-page books of fiction, travel, popular science, sports and pastimes, etc., ordinarily costing $1.50 each.

California Cultivator

An Illustrated Weekly Magazine, Devoted to the Rural Home and Ranch. One Dollar per Year.

Los Angeles November 24, 1910 San Francisco

SUCCESSFUL WHEAT GROWING UNDER DRY FARMING OPERATIONS

The possibilities of dry farming have often been over estimated and efforts along that line have at times resulted in loss, but on the whole great wealth is being added to the country by its practice. The above photo used by courtesy of The Southwest Trail gives an excellent idea of dry land wheat under intelligent handling. The general method of preparing this land is given in Field and Farm as follows:

In preparing to grow winter wheat without irrigation I plow ten inches deep after breaking the land and then I usually have six inches of subsoil. I use horses and disc plows altogether. With a four-gang disc and eight horses I can plow from eight to ten acres a day in a strip half a mile long. The fall plowing is done on the stubble land after the stubble is allowed to grow about two feet high. In the fall it is turned under and in this way gets all of the winter's precipitation, the snow, rain and frost. I leave the rough plowing until the spring and just as soon as it is dry enough to work I put on the disc. I use a different sort of a disc than many of the western farmers. It is known as the six-gang disc. It throws the dirt all one way leaving no space for weeds to grow. The boy with six horses puts the harrows on and continues to harrow lengthwise and crosswise through the season for the purpose of killing seeds and pulverizing the soil, as well as conserving all of the moisture possible. About the first of September each year I put on the leveler and level the earth, the drill in the meantime being run in front and the seed drilled into the ground. We sow wheat at the rate of thirty-five or forty pounds to the acre and let it get the winter's precipitation. In the spring when it is two inches high, I take the harrows and tip the teeth backward at an angle of about thirty degrees, so as not to tear up the soil. This method breaks the crust and pulverizes the soil and if there are weeds it will kill them. We generally harrow both ways as it gives fresh life and vigor to the grain. We then leave it to harvest time. By the methods I have described I average thirty to forty-five of wheat to the acre, fifty to ninety bushels of barley, three to three and one-half tons of millet and have plenty of good pasture for the cattle.

New Type Vertical Pump

Does It Not Seem Reasonable

To Assume That a Company

New Type Horizontal

which has been manufacturing one line of goods for over thirty years must be in a better position to furnish superior goods than one which has been in business a few months or years? The old concern has experienced engineers, superior shop facilities and, above all, a reputation and standing to maintain.

Krogh Pumps Have Been Built for 33 Years

Our New Bulletin, C-12, tells about them.

Krogh Manufacturing Company

Our Branch House, 206 N. Los Angeles St., Los Angeles, carries a complete stock

149-157 Beale St., SAN FRANCISCO

The LaVerne Rotary Cultivator

The principle of Rotary Cultivation, is an entirely new one; the action of the teeth in the soil being different from solid, cut away Discs or ordinary Cultivators. It carries absolutely no soil with it and can be used at a greater depth with less draft than any other cultivator on the market today. The tool, works so close to the ground with no wheels or other attachments to catch limbs or tear off fruit, that it can be used to cultivate under the trees, where ordinary tools do not reach. The manner in which the teeth enter the soil, tends to keep them sharp and one set usually lasts a season.

We guarantee satisfaction in regard to work and quality of construction.

TRIANGLE TRIP OVER THE

Northwestern Pacific Railroad

One of the most delightful scenic One-day jaunts in America.

150 miles of Mountain and Redwood Forest Scenery, a Boat Ride on San Francisco Bay and by rail along the Russian River.

Leave San Francisco 7:45 A. M. daily excpt Sunday, and 8:45 A. M. Sunday only, by boat across the Bay of San Francisco, in full view of the Golden Gate to Sausalito (the Sorrento of America). Thence via picturesque San Rafael and thriving Petaluma (home of the chicken industry), through Sonoma Valley to Santa Rosa and Fulton. From Fulton, through magnificent mountain scenery and redwood forests and along Russian River, to Monte Rio. Return is made along the coast, passing Tomales Bay, Point Reyes, San Anselmo, etc., to Sausalito, arriving at San Francisco 6:35 P. M. daily except Sunday, and 7:05 P. M. Sunday only, the same evening.

If preferred, trip can be reversed, leaving San Francisco at 8:15 A. M. via the coast to Monte Rio and returning along the river and through the valleys, arriving at San Francisco 6:35 P. M. daily except Sunday, and 7:35 P. M. Sunday, the same evening.

Round Trip Fare for Triangle Trip $2.80, except on Fridays or Saturdays, it is $2.50 and on Sundays only $2.20.

Tickets on sale 874 Market St., (Flood Bldg.) and Sausalito Ferry Ticket Office.

Some Hardy Flowers for the Southwestern Gardens

Flowers and Shrubs Which Will Do Well Under Conditions in Arizona and Other Southwestern Territory. By J. J. Thornber, Agricultural Experiment Station, University of Arizona, Tucson.

It is the common lot of home-builders in new countries to meet with failure in their earlier attempts to grow the less hardy and less enduring plants, including flowers and similar ornamentals. This has been particularly true in the Southwest where climatic factors are a severe test for any but native species or hardy introduced ones. After no little experience and observation in the growing of such plants, the writer has prepared this article in the hope that it may be of some help to those desiring to beautify their surroundings, if this may be done without too great an outlay of time and money. It is, of course, to be granted that winning bread and providing shelter is always of first importance to a family, but after these and other necessary things are assured there comes a longing on the part of most of us for more pleasant environments, including the association of flowers, shrubs, and trees. The lack of these very things or the failure to realize them with reasonable effort, is often responsible for discontentment and dissatisfaction among rural dwellers in new communities, and their consequent removal to other untried lands to begin over again. How often has the farmer's wife amidst her solitude and too often desolate surroundings complained of the difficulty of getting a few plants to grow about the home!

In presenting what follows, it is with the assurance that the plants suggested are hardy, and ordinarily can be depended upon, except in instances noted, to grow with moderate care. Many of them are flowers that grew in the gardens of our forefathers and hence are hardy throughout the country being as valuable for the East and North as for the Southwest. Next to the picture of desolation and indifference portrayed by a home with no attempts at ornamental planting of any kind, is one set with a lot of half-dead, chlorotic plants keenly depicting failure and disappointment. Such plants speak poorly for a country and are a source of constant annoyance to the planter. Better a group of homely, rugged native varieties than a collection of sickly, sun-scorched roses, or a bed of old-fashioned zinnias to one of lilies, if the roses and lilies cannot be grown to moderate perfection without undue effort.

Climate versus Plant Varieties.

A lack of appreciation of the differences between our winter and spring, and our summer growing seasons is responsible for the failure of many plants, particularly flowers, to make any growth whatever when planted. Too often we are sowing sweet peas and poppy seeds when we should be planting petunias and zinnias. Some of us endeavor to grow the same varieties of flowers here in the summer season that we did in the states farther north and east, and in this we almost invariably fail. The exerienced Southwestern truck gardener, with his acre of rich valley soil, knows too well not to waste time trying to grow such vegetables as onions, peas, and spinach during our extreme summer heat, though these conditions are perfect for beans, squashes and sweet potatoes. The current statement of some years ago that the city-bred man is as much at home on a ranch in the Southwest as the experienced Eastern farmer contains some truth and is only another way of saying the same thing.

In a previous publication the writer pointed out that species growing remarkably well during our winter and spring months are seldom able to make any headway in the summer season. In fact such plants usually die at the beginning of the hot, dry fore-summer, or at least cease growth and production of flowers and seeds, even with moderate irrigation. Witness for example, the fruitless attempts at our lower altitudes to grow sweet peas, ten-weeks stock, candytuft, crimson flax, or even California poppies in the summer. And the reverse is likewise true for such varieties as flourish during the hot weather. Seldom do they make any growth worthy of note in the winter season, and usually they are not at all in evidence, having been cut down by the frosts of late fall.

Winter and Spring Bloomers.

As concerns annual flowers for late winter and spring blossoming it is true in general that varieties listed in seed catalogues as "hardy annuals" are the ones most certain to thrive during our cooler temperatures. This group is made up largely of such well-known plants as mignonette, candytuft, sweet alyssum, sweet peas, sweet sultan, ten-weeks stock, snap dragon, pot marigold, common parsley, annual or rocket larkspur, and corn and opium poppies. To these may be added also the equally hardy Arctotis grandis, crimson flax, perennial flax, blue lupine, annual phlox, Mexican evening primrose California poppy, and the gaillardias, the last six of which are indigenous to the Southwest. Along with these should be planted for spring and early summer flowering the biennial foxglove, Canterbury bells, and the ever-present and hardy hollyhock.

Seeds of the above plants may be sown any time in September or early October in ordinary, well-prepared garden soil. When sown in September the young plants grow to some size by late fall, and are less subject to injury from birds and grasshoppers. The plants require only moderate irrigation during much of their growing season by virtue of moderate temperatures, and of the winter rainfall which at times is sufficient to supplement a considerable part of the watering. With a few exceptions including the biennial species, the growth of these varieties is at an end by the middle of May when the hot weather sets in, after which most of us have little inclination to look after beds of flowers, while still others seek cooler climates. These winter and spring growing plants are accordingly well suited to our country and with the perennial species to be noted next should come to be widely grown. It is to them that we must look for cut flowers and diversity of color during our festive winter seasons when the landscapes in other countries are bleak and sere. During their season of growth they may be seen in profusion on the University campus at Tucson, and the Capitol grounds at Phoenix, where no little attention has been given to them.

In addition to Canterbury bells, foxgloves, hollyocks, and gaillardias, certain of the annuals, as phlox and larkspur, will continue with cultivation and frequent watering, to blossom well into the sumer season. No other of our winter growing plants supply so many flowers for cutting, nor so wide a range of color as the sweet pea. They should be given deep, rich soil and moderate irrigation, the latter in particular, after the first flower buds appear. Excellent results follow planting them in trenches a few inches below the level of the ground, and gradually filling these in with soil and rotted material as the plants get some size. This insures deep rooting during the dry spring, with the result that the flowers continue of good quality for a much longer time.

There are a few perennial species blossoming in winter and early spring that should be planted at the same time as the annual flowers just noted. Of these the well-known sweet or English violet is one of the most satisfactory. Besides blossoming freely during the winter, with moderate watering it remains green throughout the year, and even if allowed to go unirrigated two or three months in the summer a fresh growth starts up in the early fall, from the underground stems. Violets should be re-set about every second year to keep the roots from becoming too matted, and also to renew the soil. The usual custom of planting winter growing plants like the sweet violet in the springtime is not good, as such newly-set plants require constant watering throughout the summer to keep them from dying. Far better it is to set them in the fall just as growth begins naturally. This is a safe rule to follow with all plants.

The various kinds of Narcissus furnish excellent cut flowers for winter and early spring, though they are often shy bloomers. The more common of these are the Chinese sacred lily, poets' narcissus, trumpet narcissus, comon daffodil, and jonquils, though several others of the group do equally well. September and October are also good months to set out such other bulbous plants as the star of Bethlehem, Roman hyacinths, the several varieties of oxalis, and the Asiatic ranunculus. The latter furnishes an abundance of bright-colored, daisy-like flowers in the spring, being considerably grown in the Salt River Valley. Irises represent another group of valuable spring bloomers. The German iris is planted more than any other, and always with good results. A clump of these plants is a feature in any spring landscape. Though remarkably tolerant to arid conditions the German iris does best in deep soil with an abundance of moisture. A somewhat similar though less showy plant, is the sweet flag iris (Iris pseudacorus), quite common about Phoenix. The little Spanish iris (Iris xiphium) also does well here. Bulbous species like the above, and perennials in general need little attention when once established, but continue flowering in season year after year. For this reason they are more economical in the long run than annuals which need re-sowing, though the latter make a quick showing which is always desirable on new grounds.

Carnations, verbenas, and periwinkle or trailing myrtle, likewise are best planted in the early fall. Carnations in particular, should be given a moderately well enriched, sandy loam. These and verbenas are nearly continuous bloomers with us, while the varieties of periwinkle are evergreen trailers, with blue bell-shaped flowers appearing n the spring. Periwinkle is a general purpose plant, growing almost wherever planted, and thriving in both poor and rich soil, and in shade and sunlight.

Varieties for Summer and Fall Blooming.

On account of heat and aridity, only the hardiest garden plants will grow through the summer season with any degree of success, and even these require frequent or moderate irrigation. Of the annuals the following have been found to be the most successful: zinnias; globe amaranth; prince's feather; cockscomb; hyacinth and scarlet runner beans; golden feather; summer chrysanthemums; cosmos; China asters; four-o'clock or marvel of Peru; castor beans; garden sunflower; balsam apple (Momordica); cypress vine; and the various morning glories including scarlet, blue and purple flowered varieties, also Japanese morning glory and the moon

Citrus and Tropical Fruits

MELANOSE.

There has been much complaint during the present summer of the presence of Melanose on citrus fruits. The most of these complaints have come from the northern half of the cirtus belt, where the disease seems to be the most prevalent. One grower writes: "There are thousands of oranges in the groves hereabouts affected." The question of all is: What is it and what is the treatment?

General Appearance.

Melanose is a disease that starts only on the young leaves, stems and fruit. As the tissue of these parts grows older, it becomes immune to attack. The individual marks, or spots, caused by the disease, start as sunken points, which grow larger and more evident as the tissue grows older. They may reach a diameter as great as 1-16 of an inch. Frequently these marks are so plentiful that as they grow they run together, forming a mass or area in which the individuality of the marks will be lost.

The individual markings, and sometimes the areas, become arranged in circles, or parts of a circle. This is characteristic of Melanose.

In many cases, particularly if the fruit hangs so that water drips onto it from a leaf or branch above, the location of the areas will resemble withertip tearstaining.

Description of the Marks.

The markings of the Melanose in its mature condition are wax-like and reddish brown in color. They somewhat resemble a drop of melted sugar burned to a reddish brown color. They are slightly raised above the surrounding surface.

Effect Upon the Plant.

Leaves, stem and fruit are affected by the Melanose. Where markings are very plentiful, the leaf may be stunted and deformed. Such leaves will be more or less bleached.

Upon the stems and fruits the markings more frequently run together, forming areas. Where the disease is severe the stems will be more or less completely covered with the markings. Young terminal twigs, when severely affected, will die and dry up, appearing very much the same as the stained terminal branches in dieback.

The fruit, when severely affected at an early age, will be stunted. In most cases it will grow to a normal size, but will have the markings more or less completely scattered over its surface. The markings are not attached bodies like a scale, but are a part of the tissue of the fruit itself. Therefore they can not be removed and the fruit is worthless for shipment.

The development of areas is greatest on the fruit. Very often they are large, cake-like, and cracked in lines like dried mud.

Melanose and Dieback.

It frequently happens that Melanose and Dieback are confused. In some cases it requires very close observation to distinguish between the two. The following are some of the points of difference between the two diseases:

Melanose.

1. The markings of the Melanose on the leaves, stems and fruits are the same.

2. Its markings are very superficial and in most cases they are slightly raised above the surrounding tissue.

3. The markings are very small, individual, and scattered like pepper over the affected surface. Often areas of the markings will interlace, surrounding little fields of green.

4. The markings are sometimes arranged in circles or parts of circles.

5. No gum is formed in the angles of the segments and surrounding the seed in the fruit.

Dieback.

1. The symptoms of the dieback on the stems, leaves and fruit are varied. Any staining of the leaves that would be at all comparable to melanose markings very seldom occurs.

2. The dieback staining that occurs on the fruit and stems is almost never raised, and extends to more or less depth in the tissue.

3. Dieback stains nearly always occur in areas that are more or less continuous.

4. Stained areas caused by dieback are never arranged in circles or parts of circles.

5. Gum is very often formed in the angles of the segments and surrounding the seed in the fruit.

Prevention.

Melanose is present in small amount in nearly all groves. It is usually found on the rank-growing water sprouts. It is of practical injury to the leaves and stems only in severe cases. This is different with the fruit, where only a small amount will render it unsalable. No treatment is known that will cure the marks caused by the disease. Prevention is the only remedy. Since the disease starts only on very young tissue, the fruit becomes affected when it is very young. Therefore, methods of prevention must be carried out in the springtime.

In 1894, Swingle and Webber found that melanose could be controlled by the use of Bordeaux mixture, or ammoniacal solution of copper carbonate. They advised two sprayings, "the first about two weeks after the flowers have fallen, and the second about a month later. A Vermorel nozzle, and a pump giving a good spray, should be used. The spray must be applied to the fruits in the form of a fine mist covering them thinly and evenly." Since these sprays are fungicides, they will kill off the natural fungus enemies of the purple scale and allow this scale to develop. Hence these sprayings should be followed at intervals with some good insecticide until the friendly fungi have returned.—B. F. Floyd, Florida Agricultural Experiment Station, in Fruit and Produce News.

CITRUS TREES REQUIRE POTASH.

Apparently California citrus growers are not alone in discussion of the decadence of orange trees. In an article on fertilizers for citrus trees in a number of the Australian Cultivator we note:

"All orchardists must, however, admit that there comes a time in the history of every orchard when, in spite of careful cultivation, spraying and fumigating and liberal application of bone manures, yields do fall off in quality, if not in quantity; and, in fact, there is every sign that something is wrong. Many practical men can also testify that they have been able to clean and restore to health and vigor neglected and dirty orchards solely by careful cultivation and judicious manuring."

The article calls attention to the fact that potash fertilizers are so high in price in that country that nitrogen and phosphoric acid have been much more abundantly supplied and urges the return of more potash to renew the vigor of the tree.

It gives the requirements of the annual product of an acre of oranges as 32 pounds of nitrogen, 13 pounds of phosphoric acid and 52 pounds of potash. For lemons the requirements are 36 pounds of nitrogen, 12 pounds of phosphoric acid and 51 pounds of potash.

According to analysis many citrus soils in Australia are rich in potash Touching upon that point the writer says:

"There is the initial difficulty, which will be recognized by every practical man, of obtaining a small sample of, say, a few pounds weight at the very most, typical of the great mass of soil contained in an acre of land to a depth of one foot; there is the difficulty that chemists have not yet been able to determine even approximately, the solvent power of the roots of crop plants; and there are also the facts that, although all plants require exactly the same substances for their proper growth and development, different plants not only require these substances in different proportions, but also possess varying powers of absorbing them from the soil. All these factors combine to make a chemical analysis alone an insufficient guide to the manurial requirements of any soil. It is true that an analysis will show whether a soil is actually lacking in any ingredient, but that is all. A soil might contain abundance of a particular constituent and yet the application of a manure containing that constituent might give very profitable results.

"It is obvious that only practical trial can prove this and in going on to consider in detail the profitable manuring of citrus fruit trees, the writer will in the first place attempt to show why it is that the great majority of growers have failed to appreciate the importance of the general rule that only a suitable combination of artificial fertilizers can give the maximum profit.

Later, referring to the potash requirements, the writer adds:

"Ask the citrus fruit growers of Australia to name the commercial fertilizers they always use and nine-tenths of them will mention "bone-dust," "blood and bone," "phosphates," "sulphate of ammonia," etc. Only the most progressive will speak of potassic manures. The explanation of this is not far to seek. Phosphatic and nitrogenous manures are readily obtainable and are continually offered to growers by merchants, while potassic manures, by reason of their high price per ton, are difficult to sell and are for this reason left severely alone by vendors.

"Now the fundamental facts which every grower who would spend money on manures to the best advantage must clearly realize are these:

(1) That of the substances essential to plants, only three become deficient as a rule in ordinary soils.

(2) That these three substances are: Nitrogen, phosphoric acid and potash.

(3) That if large crops be removed year after year, one or more of these substances must become deficient.

"With these facts clearly in mind, the requirements given above will show the sceptical in the first place that oranges and lemons remove every year large quantities of potash and nitrogen and in the second place that in animal manures, i.e., bonedust, blood, etc., there is supplied absolutely none of that most essential substance—potash."

Touching more judicious fertilizing:

"By judicious manuring is meant a proper combination of manures supplying all that the crop removes. If growers have long been in the habit of using only "phosphates," "ammonia," "blood," etc., let them look once more at the figures given and realize, if they have never done so before, how they have gone on, year after year, adding, generally in large excess, phosphoric acid and nitrogen only and have entirely neglected to supply the potash which is of such prime importance to both yield and quality of fruit."

TREES IN EUROPE.

There are splendid trees in Paris and around it, the big horse-chestnut predominating. And they have a funny fashion over there of cutting back their trees in the country every year so that in the spring you see only the great stub sticking up out of the ground eight or ten feet with a big knotty place on the top of it. Out of this knotty knob spring a hundred or so shoots which are allowed to grow all summer and perhaps until the next spring. Then they are all cut off again and used for fagots, or possibly for some other purpose which we did not discover. The trees have a queer dwarfed look, but I surmise that in a closely settled country it is necessary to cut the trees back like this in order to allow the sunshine necessary for the crops. It is likewise necessary to use every shoot for some special purpose. The American who has seen France must find his heart bleeding at the waste of trees which goes on in America. We saw large trees in France, but nothing wonderful. And everybody kept telling us that in the forest of Fountainebleau we would see marvelous trees, giants. But when we got to the forest itself they told us that in order to see the giant trees we would have to stay over and walk way back into the depths of the forest.

As it was, we saw no trees in France nor in any other country we visited which began to compare with the wonderful trees in America. The largest we saw over there would look like saplings beside the redwoods of California, or the firs of Oregon. And the wonderful old English elms proved to be not nearly so large or graceful as the elms of New England, which sprang from them. English elms are very old and gnarly. The English are proud of the "artistic shapes" of their elms. To us many of them look grotesque.—Nautilus.

Orange county has approximately 13,000 bearing apple trees 167,000 bearing apricot trees, 92,000 bearing lemon trees, nearly 800,000 bearing orange trees.

Deciduous Tree-Shrub Fruits

INVESTIGATION OF GUM DISEASE OF DECIDUOUS TREES.

J. A. Prizer, Corona, California.

Visiting an orchard at Hemet, on the 14th and 15th of August of the present year (1910) for the purpose of investigating some gum troubles in apricot and peach trees, I found a great number of the trees affected, both the apricots and the peaches seemingly attacked by the disease, but the apricots suffering the most. Out of five acres of apricots there had already been lost some fifty or more trees.

The disease made its appearance in scattered parts of the orchard. Four or five trees would be affected and then it would skip a few trees and would appear on another one or two. The sap breaks out around the trunk and wherever a branch has been cut off. In the spring sap pockets were formed, the bark turning a shiny black and the sap finally breaking out and running down the trunk or forming balls of black sap on the trunk. And frequently it would not break out at all but would be found in a crystallized form under the bark.

Undoubtedly the cause of the trouble is poor cultural conditions found in this orchard. The soil is of a decomposed granite formation and runs from that into a sandy loam farther down in the valley, though in this particular orchard the soil is mostly of the granite formation. This soil shows a marked tendency to bake and last spring it was allowed to go without plowing until April, when it had baked so hard that it was almost impossible to plow it.

The improvement of the cultural conditions and the removal of the causes which undoubtedly brought about the gummosis in the peach and apricot may be discussed under the two heads, cultivation and fertilization.

So far as irrigation is concerned it would seem that the orchard had been well treated, as it has had plenty of water and this put on in a regular and uniform manner. It has been irrigated each month throughout the summer, begining with May and running 86 inches for two days on twenty-two acres.

But in the matter of cultivation we may look for our primary cause of the gum trouble. The soil as mentioned above has a great tendency to pack, and that around the crown of nearly every tree was packed hard and smooth for a space of about three feet each way from the trunk. This patch of soil should be loosened up around each tree with a mattock and kept in a loose condition throughout the spring and summer. Although the surface soil between the rows had the appearance of being in good condition, that under the surface was dry and hard, and in the form of a hardpan. This condition was probably brought about by continually plowing and cultivating at the same depth and when so caused is often called a "plow sole." It is injurious to any tree growth and many physiological troubles in the trees grown on it may be traced to this condition of the soil. It should not be permitted to continue and should be broken up with a sub-soil plow run to a depth of ten or twelve inches or even more.

A variation in the depth of succeeding cultivations and plowing will prevent its return. The bard baking of the soil last spring, as noted above, probably had not a little to do with bringing on the disease this summer, or at least gave it great opportunity to get in its work at an early date. The soil should be carefully watched and at the first sign of baking, plowing should begin. As soon as the soil is in a condition to work after the spring rains this should take place and under no circumstances should the surface be permitted to get into the hard condition of last spring.

In the matter of fertilization a great deal may be done to improve conditions and bring the trees back to their normal state. No green manure crops have ever been grown in this orchard and practically no barnyard manure or commercial fertilizer ever worked into the soil. By growing a cover crop of some legume as the pea, the physical condition of the soil may be greatly improved and a good supply of nitrogen added for plant food. Although the granite soil is usually full of the elements of plant food, yet these are not always available for the plant to use and the cover crop may do a great deal toward opening up the stores of such food. The cover crop will be of especial value to a soil like the one under consideration, through the addition of great amounts of humus. The roots of the plant extending down into the soil and decaying there will solve in a considerable measure the problem of hardpan. The soil will take water more readily and have greater power of retaining it. In short, the growing of some cover crop, such as vetch in the fall and turning it under in the late winter, or the cow pea in the summer and turning it under in the autumn, is of the utmost importance to such soil conditions as these, and is a practice which should be pursued if success is to be obtained.

The humus of the soil will also be increased by the use of stable manure, but great amounts of this need not be used if heavy green manure crops are grown. Applications of commercial phosphates will do much to give the plant new strength and vigor and should also be made.

In the treatment of the tree itself, a great deal may be done to help it recover by removing or cutting the bark in places and thus relieving the pressure in the trunk where the sap has accumulated. To do this a slit should be made from the crown to the forks of the tree wherever these accumulations have occurred. The slit should be made with a sharp knife and a strip of about a quarter of an inch wide taken out. Then an ocherous paint or some form of grafting wax should be applied to the wound. The latter is preferable and is easily made with four pounds of resin, one pound of beeswax and from half to a pint of linseed oil.

To sum up the methods to be used in bringing the trees back to their normal condition:

1. The hard soil beneath the surface or plow sole should be broken up with a subsoil plow run to a depth of ten or twelve inches and should always be kept in a loosened condition after once treated in this way. The Soil should be cultivated well up to the trees and that around the crown loosened up with a mattock; a good mulch should be kept.

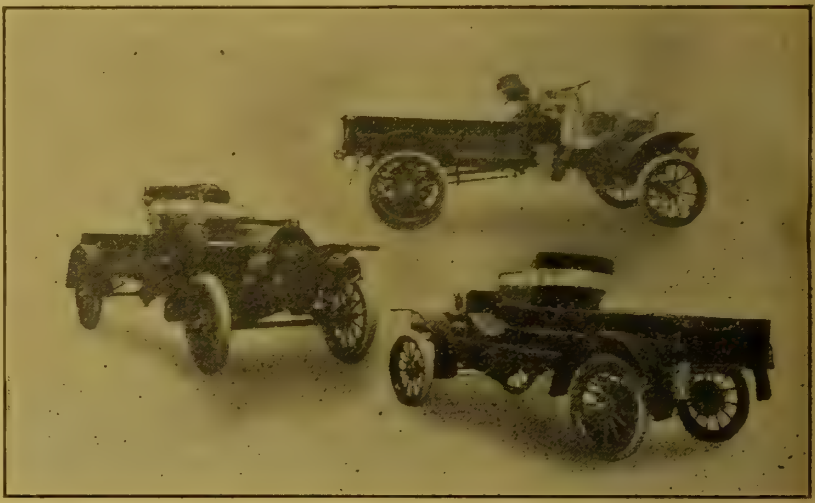
2. The surface should at no time be permitted to bake.

3. Some legume crop should be grown each year, the vetch for fall planting and the cow pea for summer planting.

4. All the stable manure that it is convenient to obtain should be placed in the soil and heavy applications of phosphates in commercial form should also be added each year.

5. The tree itself should have the bark on the trunk and if necessary on one or two of the larger branches, slit from the crown up, to relieve the pressure of the accumulated sap, and then an application of grafting wax placed over the wound.

The writer's attention was called to the fact that in the first two years after this orchard had been set out, the owner, in order to realize something immediately upon his investment, had grown potatoes and other crops between the rows of his peaches and apricots. Although Mr. Hale, one of the foremost peach growers of the country, says that potatoes are always harmful to the peach when grown between the rows, it is doubtful in this case if this fact has had much to do with bringing on the gum troubles. Probably the damage done by this practice at Hemet was in not giving the peach trees or the apricots their usual amount of attention at this time or it may have been that through shallow culivation at this time that the formation of hardpan took place.



The Duro Farm Truck

Ventura County bean farmers have already delivered 125,000 bags of Limas to the Hueneme warehouse.

TAKE CARE OF THE FARM MACHINERY.

Farm machinery is often sadly neglected when not in use. It is not uncommon to see binders, cultivators, grain-drills, plows, etc., left out all winter in the field where they were last used, or in the barn-yard. Here they are exposed to the sun, rain and snow at all times of the year, and the actual depreciation from such exposure is more than the wear caused by use. To leave machinery exposed to all kinds of weather has the same effect as it would have on house furniture, live stock, or anything that Nature has not provided with protection against the elements.

One of the best investments on the farm is a good machine-shed in which all machinery can be put when not in use. Statistics show that such an investment will mean a return of 30 per cent on the money invested. It increases the life of machinery fifty to one hundred per cent. Even at the present price of lumber, a machine-shed, 16x32, well built on a concrete foundation, will cost only about $125. Such a building will house all the farm implements used on the average Minnesota farm. To figure the life of such a building at fifteen years, with a small outlay for an occasional coat of paint, will make the annual cost of sheltering all the machines on the farm less than twenty dollars per year. Such small annual cost will pay many fold in its saving on the depreciation of the machinery.

A little time used in overhauling and cleaning up each piece of machinery, when one is through with it, is well spent. Tighten up all the bolts, saturate the bearings and cover all wearing surfaces with a good grade of machine oil. This will stay on from one year to another, and keep the parts from rusting. Plow lays and all polished parts should be cleaned and covered with oil or grease of some kind to keep them in good condition. There is no part of the farm operation at which a little time can be spent to better advantage than looking after farm machinery.—Minnesota University News.

CANADIAN FRUIT OUTLOOK.

The monthly Fruit Crop Report issued by the Department of Agriculture of Canada, shows that the apple crop generally is uneven, probably due to the difference in treatment of orchards. A much larger proportion this year have been cared for than usual and where trees have been properly looked after a good crop was harvested. The early apples have been picked and shipped, and fall varieties are going out rapidly. The fall and winter varieties are well matured and the risk of frost damage is less than in years.

Southern Ontario harvested a light crop of early apples but the fall yield was better. Winter varieties are scarce. The Norfolk Co-operative Fruit Growers' orchards produced about 30,000 barrels, but these were well cultivated and sprayed. Western Ontario is almost without winter apples. Even some well cared for orchards bore no fruit. The district on the northern shore of Lake Ontario will have a medium crop of winter apples. In this section Spies are showing up particularly well. Baldwins are good. Kings are light, and there are many failures in Goldens and Roxbury Russets. All fruit is well colored. In Eastern Ontario, the St. Lawrence Valley and the Eastern townships of Quebec winter apples are light. Duchess will produce a full crop and Wealthys medium. McIntosh Reds are light, but well sprayed orchards show good crops. A few orchards in the St. John Valley of New Brunswick will be light. In the central part of the Annapolis Valley the crop is almost a complete failure, but a slightly better crop is reported on the slopes of the North and South Mountains. The crop for the whole valley will be light and quality poor. Gravensteins are poor and light. Baldwins rank the highest in yield, but will be only medium. Ben Davis and Spies, though showing some failures, can be ranked as a light crop. Prince Edward Island has the poorest crop in years, even crabapples being almost a failure. British Columbia will harvest a large crop, but the fruit is small and deficient in color.

The principal commercial pear orchards in Eastern Canada report a medium to full crop. In Southern Ontario the Bartletts are maintaining their pre-eminence as a crop producer. Clapp's Favorites and D'Anjous show a good crop, while Keiffers have turned out better than expected. Duchess are light. The plum crop of the Dominion has not been large, both Bradshaws and Lombards being light to medium. Cranberries were light to medium. The commercial bogs in Nova Scotia had a good crop, but those in Prince Edward Island were almost a complete failure. Prospects for grapes have improved with the season and barring early frosts a medium to full crop will be harvested. —Packer.

REFUSED $30,000 FOR A TREE.

Thirty thousand dollars was the sum recently offered an Eastern Washington nursery company for an apple tree located near Lake Chelan. The proffer was made by a syndicate which desired to propagate the tree. It was turned down by the nursery company, which will develop the fruit itself.

The tree is twenty years old, and is called the Chelan. The fruit is golden yellow, and is said to be different from that of any other apple grown in Washington. It is also said to possess exceptional keeping qualities, a box having been kept in storage at Spokane for two years without any marked deterioration.

Twenty years ago, so the story runs, an Indian planted a handful of apple seeds, three of which grew. The fruit of but one of the trees was good for anything. The tree is now of great size and a prolific bearer. Last year, at the National Apple Show at Spokane, fruit from the tree took first prize for new varieties of apples.

The nursery company has for two or three years back taken grafts from the tree, and now has enough young ones to set out 1000 acres. This is to be done at once. Great precaution has been taken to prevent the theft of the young trees or of the grafts or buds.—N. W. Farm and Home.

The Department of Agriculture of the Hawaiian Islands is seeking for what it terms a "big small farmer," that is one qualified to take charge of a small tract of land on which intensive farming will be demonstrated.

Governor Hay of Washington, appointed a committee to draft a new irrigation code for that state. The committee held its first meeting in Spokane, November 17th.

The Ornamental Garden

GROWING LAVENDER.

A writer living in California says: "I never knew a well established lavender plant to be affected detrimentally by anything. It will stand extremes of heat and cold, drouth or flood or neglect, and still yield abundance of blossoms, which is the part used for scenting and in medicine. It will grow readily from seeds or from cuttings, and yield blossoms the second year, commencing to bloom in July. While the blossoms or seeds are the parts used for making extract of lavender, every part of the plant is full of perfume. A few dried stems and leaves burned in a room will perfume and purify the atmosphere deliciously. The plant is not extensively raised and a high price is paid for its product, its blossoms or seed selling as high as fifty cents a pound.

It is recommended that women might make a neat little sum by growing the plant, as it is very easy to raise, and sells readily to druggists and others. Its uses in the way of perfume are legion. Every part of the plant may be used in some way." This may be true as regards California, but its growth might not be so ready in other localities. The demand for it is said to be large, and the supply inadequate, as it has not been grown extensively for commercial profit. But it would be a good plan for every housewife to raise a few plants for her own use, as a few blossoms or even leaves and branches laid among clothing give a most refreshing perfume. For filling sachets, it is invaluable.—The Commoner.

THE PEONY AND ITS CULTURE.

Few people know the wealth of beauty and perfume of the peony. Quite everyone knows the brilliant old, red peony or "piny" of the old-time garden. But from that to the modern peony is a great evolution. The modern peony is superior in size, perfume and finish to the chrysanthemum, with less care and more certain results for labor expended.

The requirements of the peony are simple, yet at a few periods they are very easily damaged. We have large areas to handle and cannot give them the same care one could give a few plants.

We give the soil a thorough dressing of fresh manure early in the fall and sow to rye.

We prefer to plant any time during September, but planting may be done at any time (if well-watered for a few days) from September first to May. We do not approve of lifting plants in the spring after they have begun already to make a rapid and tender growth.

Plants that are kept dormant by being dug in the fall may be planted until June with fine success. We have planted big clumps when in full bloom and they grew well, but we do not advise it except when absolutely necessary.

When planting peonies in clayey ground, they should be set about four inches deep, but in light, sandy or loamy soil, five or six inches deep. Old clumps I plant a bit deeper, leaving the crown covered lightly until late when more soil is drawn over them to make the surface level.

Never use much manure the first year on newly planted peonies, and always care should be exercised not to overmanure them. The best way is to cultivate them about three inches deep, then apply about one inch of any manure, working the ground several times before winter sets in, or they may be manured after the ground freezes, and the manure worked into the soil in the spring.

Keep all the weeds out of peonies and do not dig over three inches deep, from October until the buds are as large as acorns. Many persons have complained about their peonies not blooming, and upon investigation and from observations from my own experience I found that whenever we dug deeply around plants at the time above stated the plants either came up blind, or bore a very small percentage of good blooms, so we learned to employ shallow cultivation.

Plant peonies in the bright sunshine, away from trees that are liable to shade them or whose roots may sap the plant-food in the soil where they are planted.

In lawns where peonies are planted they should be kept well cultivated to a radius of about two feet. Never plant peonies where the crowns are likely to be covered with water longer than a very short time. Peonies under water for several days are likely to be very quickly spoiled.

Peonies are grown from a division of old plants and also from seed. From seed they require from five to eight years to come into full bloom.—Farm World.

HOW TO USE CALADIUMS.

If you have an unsightly spot in the rear of the house—which by the way should never exist—you may hide it from the casual visitor by a border of the beautiful broad-leaved caladium. Against a background of sweet peas or salvia it produces a beautiful effect. The best way to cultivate caladium is to plant the tubers early in the spring. The soil should be very rich with leaf-mold and well rotted cow or sheep manure and should be worked up with a little sand into a loose loam. The addition of bone meal, well worked into the soil, will help the growth of the plants and add to their beauty. Of the fancy-leaved caladiums those best suited to outdoor planting are those having a predominance of green in the foliage, as the highly colored kind do not do quite so well.

With Christmas coming the Cultivator may be pardoned for referring to a beautiful little 232 page book, pocket size, which would make a most acceptable offering to a lover of wild flowers. This book is "Flower Guide. Wild Flowers East of the Rockies." Of course, we wish it were West of the Rockies, but as it is, many of the flowers mentioned will be of interest to Pacific Coast people, and to those who trudged through the Eastern woodlots it brings back the woodsy odors of springtime in childhood days. It has a color plate illustration on every page representing one or sometimes three or four different flowers. The book is published by Doubleday, Page & Co. and can be supplied by the Cultivator at publishers' price, which is 75 cents for flexible cloth binding or $1.00 for leather.

Garden and Field Crops

HOME VEGETABLE GARDEN.

Much loss of time in the planting of a garden can be avoided by making a definite plan of the garden several weeks or even months before the planting is to begin. After measuring the area that is to be used for the garden, the next step is to decide what vegetables are to be grown. If space is ample this will be determined primarily by the personal tastes of the gardener and his family. However, if only a limited amount of time and attention can be given the garden it may be wise not to undertake the growing of some of the more exacting crops, such as egg plant, cauliflower and celery, even though space is unlimited. If, on the other hand, the space is limited, it may be necessary to leave out a part or all of the vegetables requiring a large amount of room, such as potatoes, sweet corn, lima beans, cucumbers, squashes, melons, and sweet potatoes. In extremely limited areas in the city there may be room for only a small bed of lettuce and radishes, to be followed by string beans or a few tomato plants. Whatever the space available, the crops to be grown should be decided upon long before the time for planting.

The next thing to decide is the amount of space which is to be devoted to each of the crops which are to be grown. This will depend partly upon the nature of growth and productiveness of the crop and partly upon the particular fondness of the family for the given product. A very small area will supply all the lettuce the family can use, while the same space devoted to sweet corn would be merely an aggravation.

In planting the garden it is well to arrange the vegetables in the order in which they are to be planted. This facilitates the preparation of the land for planting and makes it possible to maintain the unplanted portion in good friable condition with the least expenditure of labor. In order that the vegetables may be so arranged, it is necessary to know the proper time for planting each crop. Failures often result from planting some crops too early and others too late. Each crop has its own peculiarities as to temperature and moisture requirements, and planting should be timed accordingly.

Vegetables may be roughly divided into two classes; cool season and warm season crops. The former are quite hardy and will stand light frosts without injury.

Of the crops that are to be planted at the same time, those that are similar in character of growth and cultural requirements, or that occupy the land the same length of time, should be planted together, since such an arrangement forestalls the interference of one crop with another, facilitates the proper care of the various crops and simplifies the matter of clearing the land and fitting it for later planting in the case of short season crops.

Having the garden definitely planned as to the arrangement of the different vegetables and the time of planting each crop, the only other arrangements that need to be made in advance of the planting season are the selection and purchase of seeds and the manuring and plowing of the land.

As a rule, it is more satisfactory to select the seeds from the catalogue of a reliable seedsman and order them by mail, than to depend upon the supply at the grocery store. In any case, it is wise to procure the seeds considerably in advance of the planting season.

After the crops are planted, success in the vegetable garden depends chiefly upon thorough and frequent tillage. The tillage should begin as soon as the plants can be seen, and should be repeated at intervals of about one week throughout the season. Much labor will be saved by substituting a wheel hoe for the hand hoe for stirring the soil close about the plants while they are small, and by using a horse for cultivation between the rows whenever there is sufficient space. If these methods are employed, the most irksome features of vegetable gardening—the weeding and tedious hand-tillage—will be largely eliminated.—John W. Lloyd, at meeting of Illinois Horticultural Society.

ENRICHING THE GARDEN.

Well-rotted manure is the best for garden enricher. In the market gardening sections stable manure is the mainstay for keeping the truck lands filled with fertility and humus. It is spread on so abundantly that a man has to follow the plow and fork the manure into the furrow. Pulverized sheep manure and commercial fertilizers are used to a limited extent, but stable manure is the main dependence.

On garden farms where a short rotation can be followed, green crops being plowed under to keep the soil filled with vegetable matter, it may be possible to use chemical fertilizers more extensively, but on lands that are cropped year after year and made to produce in some instances a succession of crops each season, nothing can take the place of stable manure.—Western Farmer.

ORIGIN OF HUBBARD SQUASH.

James H. Gregory, the seedsman who died at his home in Marblehead, Mass., recently, once told how he became a seedsman: "A man wrote to the New England Farmer for a nice winter squash; I heard of it and we happened to have one; my father called it 'Marm Hubbard's Squash,' because we got the seed from an old lady by the name of Hubbard. I sent him some of the seeds; he tried them and so well did he like them that he wrote an article, which was published in a number of papers, describing the good points of the squash. Before I realized it I was getting orders for this squash seed from all parts of the United States."

Take a ton of your chicken droppings and land plaster and add to this about six hundred pounds of ground phosphate rock, mixing these thoroughly, and scatter over one acre of ground in the spring, then scatter evenly fifty bushels of wood ashes, or use the proper proportion of kainit, instead of wood ashes, and you will have a well-balanced fertilizer for strawberries and for general purposes.

STRAWBERRY PLANTS

My plants are grown in Tropico and on land never before used for Strawberry Culture. Plants are selected by myself for breeding and the blossoms always picked, therefore the strength grows into new plants This is why my stock will produce by far the greatest amount of berries. If you are going to set out 100 or 500,000 be sure and write to

E. H. LEARNED R. F. D. No. 5, Los Angeles
Grower of Strawberry Plants only, and only the best.

(Continued from page 499)

flower. The seeds of the above should be sown by the middle of April, and preferably two weeks earlier, in order to give the young plants a good start before the beginning of the hot weather.

Of the above, China asters and cosmos are the most desirable for cut flowers, while for color and display, zinnias, globe amaranths, and four-o'clocks ranks among the first. China asters, summer chrysanthemums, golden feather, cosmos, caster beans, and the morning glories are least resistant to drought and should be watered twice a week during the drier parts of the summer; the others are robust, deep-rooting plants succeeding with ordinary care, i. e., irrigation once a week or thereabouts. Morning glories are very much at home in this country and may be sown any time from April to August. As herbaceous climbers they have few equals. They range from low bloomers with scarlet or sky-blue flowers to the tall-climbing moonflower. There are at least six native morning glories in Arizona in addition to the introduced ones mentioned. Balsam apple is a rapid growing, neat-appearng vine of the gourd family with delicate green leaves and orange fruits. The castor bean, like other rapacious growers and heavy feeders requires deep, rich soil and frequent irrigation.

Among the hardier of the rather few perennial summer and fall bloomers that grow successfully at our lower altitudes, are cannas, chrysantnemums, yellow, white, orange, and rose-colored lantanas, madeira vine, the native golden columbine, white and rosy fairy lilies (Zephyranthes), and the so-called crown imperial (Crinum amabaile), besides asparagus and lavender. Cannas are among the plants par excellence for display. Without fail, they should be re-set each year in early spring. Together with chrysanthemums and the crown imperial, cannas require good culture and frequent irrigation, otherwise it were best not to try to grow such plants. Columbines succeed only with partial shade and abundant moisture, while asaparagus and lavender are among the hardiest of the list. When once established, fairy lilies need no further attention, and altogether are very satisfactory plants. Their lily-like flowers appear from June to October. Lantanas are unexcelled for southwestern planting, being continuous and profuse bloomers, though they should be cut back and given some protection during the winter season. The above perennials should be set out in the early spring—the earlier the better.

Varieties for Growing at Higher Altitudes.

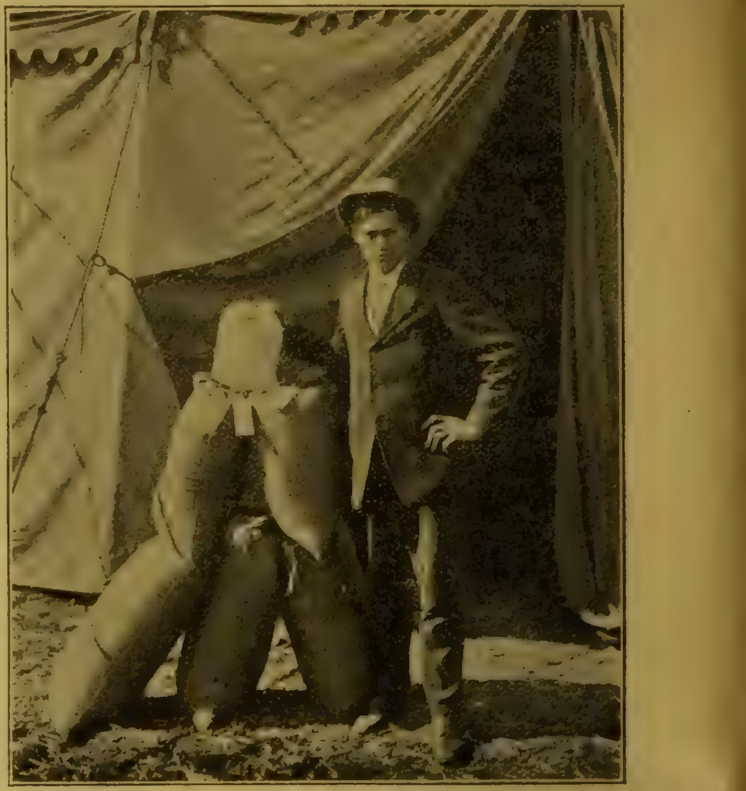
Between altitudes of 3,500 and 5,000 feet, or where the lower winter temperatures approach zero, the hardy annuals are sown to best advantage in early spring, i. e., after severe freezing weater is over, while tender-er varieties should not be sown until danger from frost is past. Perennials of whatever class are set out just previous to the time that they ordinarily begin growth, be that fall or spring. With these slight differences in planting due to the cooler spring time all the varieties noted heretofore can be grown successfully at these altitudes.

At higher mountain elevations, as for example, Flagstaff, where there is but one well defined growing season, spring planting is the rule. The conditions of growth are simpler here than elsewhere, approximating in a measure those of the prairie states to the northeast. As would be expected hardy annuals succeed best at these altitudes since the growing seasons are invariably cool, though robust summer growers like zinnias do well. On the other hand, such varieties as cosmos, chryanthemums, cannas, and castor beans are often frozen back in early September a short time after beginning to flower. In a variety flower garden in Flagstaff, the writer noted growing very luxuriantly the following plants: hollyhocks; sweet peas; sweet alyssum; candytuft; mignonette; snap dragon; foxglove; pot marigold; French marigold; China asters; Canterbury bells; sweet sultan; bachelor's buttons; coreopsis; gaillardias; corn, opium and California poppies; petunias; annual phlox; nasturtiums and morning glories, besides a goodly number of perennials. It is interesting to note that such perennial flowers as bouncing Bet, sweet William, grass and bunch pinks, Shasta daisies, phlox, larkspur, golden glow, dahlias, costmary or rosemary, tansy, gladiolus, and day lilies, together with blue grass and white clover appear entirely at home with the cool, moist growing season of the higher elevation while at the lower altitudes with great heat and aridity the growth of most of these plants is practically impossible without adequate protection.—J. J. Thornber.

STATE POLYTECHNIC SCHOOL'S BEAN GROWING CONTEST.

Last spring the California Polytechnic School at San Luis Obispo organized a bean growing contest for boys of San Luis Obispo county under eighteen years of age. The contest was organized on lines similar to those of the now famous boy's corn growing contests conducted by the schools of agriculture of the Middle West. Since this was the initial contest organized by the School a limited territory only was included. Last April the school sent out to boys who agreed to the conditions of the contest one-half pound each of three different varieties of beans—small whites, large whites, and pinks.

Under the rules of the contest the preparation of the ground, planting of the seed, cultivation and growing of the crop, harvesting and cleaning, was all done by the boy himself. The judging of the crops raised took place at the October District Agricultural Fair held at San Luis Obispo. Of the twenty boys who entered the contest Willie W. Wood of Arroyo Grande was the champion. Master Wood exhibited at the Fair 420 pounds of beans which he had grown from the one and one-half pounds of seeds. The school gave as first prize $10.00 in cash, keeping a portion of the beans raised by the prize winner for seed for next year's contest. To this amount a business man of San Luis Obispo added $17.50, the market value of the beans produced. The total first prize thus amounted to $27.50.



420 Pounds of Beans from 1½ Pounds of Seed
Grown by Wm. W. Wood of Oak Park near San Luis Obispo, Cal.

The second prize of $5.00 was won by Joaquin Pereira of San Luis Obispo, who produced 288 pounds of beans from the pound and one-half of seed furnished.

The Polytechnic School through its agricultural department is making an effort to arouse interest in agricultural instruction among the district schools within its reach, and the bean growing contest inaugurated this year is one of the methods employed for arousing activity. It is expected that next year's contest will cover a still wider area, interesting a still larger number of boys.

Fruit growers of Kootenai county, recently met at Coeur d'Alene, Idaho, and held discussions covering two days.

The Bureau of Statistics of Washington has issued tabulated information on the progress of reclamation work in that state.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

A PAYING HERD.

By Mrs. M. E. Sherman.

Cows worth retaining should make at least three hundred pounds of butter in a year. The necessity of having regular breeding animals must not be overlooked. A cow regularly breeding and producing three hundred pounds of butter fat is within easy reach of every dairyman. Many have already the bulk of their cows doing better than this and if they will only weed out the poorest ones they will find that the money they receive is greatly increased. The net income is the result that is sought by every one, except the farmer, I notice that so often at institutes when men tell of their gains, it is always the gross. Now it is perfectly possible to have a herd producing gross returns that look large, while the net is so small that it is invisible. In California if we attempt to make many large records, the cost eats up the profits when these are made officially. The cost of railroad and of official's time takes the profits out of the cows tested for that year.

Associations.

The cattle associations are naturally anxious for yearly records of cows, yet at the present time if these are to be made officially they are far too expensive to make it possible for the ordinary dairymen to compete and it makes every young animal from a cow that has a big record too expensive to the ordinary purchaser, I do not believe there is any more profit to the seller in the animals that he sells at $500 each than the ordinary breeder makes out of the animals that he sells at $150 a head. The expensive testing and feeding of the cows to produce the high records has come off their calves.

Three Hundred Pounds.

Now to return to the lowest possible amount that any dairyman should be contented to have each cow produce in his herd, three hundred pounds. Counting twenty cents a day as cost of feeding, milking and care, at present prices we have a margin of fourteen cents profit for butter or forty-two dollars for the year, counting the year at three hundred days. If the breeding is pushed the cow will freshen in five weeks after she has gone dry and bring a second calf within the year. Now if to the forty-two dollars skim milk product .6 a day is added we have $18 to add to the account beside the two calves. The cows producing three hundred pounds a year are all around us, so many of them that it is easy to get them. After a herd makes this amount then raise twenty-five pounds and after a year raise to three hundred and fifty. The fact is that plenty of cows producing only three hundred pounds have a further capacity of that second amount if fed up to it. The weeding or selecting of the cows produces within the mind of the dairyman a training that makes him wiser in his ways of attending to the cows. The only time many cows have all the food they can handle is when on pasture, yet few reason from this that if the pasture condition, of a stomach full of succulent food, was made the everyday life of the cows that they would hold to the amount of milk or butter they produce in the sweet springtime.

Statistics.

These are always dry as dust yet there are some of them that have interest right here. Some time ago back in Illinois, the tale of thirty-six herds ran about as follows. The records of 554 cows showed this difference. The best 25 of these cows produced as much butter fat as 1021 cows that had no greater capacity than the 25 poorest ones. I hope we have none that poor in California! I hardly think we have in the herds that sell milk as the cows do not have the cold weather to contend with out here. In California the majority of men hire at least part of their work done. This adds to the cost of the herd. The owner has to be boarded any way and if he does a full share of the milking it will count in the profits. A farmer never has seemed to catch on to the idea that he should count wages for himself and for his wife in estimating the actual profits.

Improvements.

Testing the cows comes first, then improve the feeding and then improve the breeding. The first testing takes out the unprofitable ones at once. Feeding liberally makes those in the profit class pay better. While breeding is looking into the future of the dairy cow in California yet I would like to say that I think there are too many rushing into the business without proper knowledge of it. I see all around me people that have taken to dairying with cows that are unfit. The old idea prevails that if we give them plenty of alfalfa they pay. Alfalfa is the best food ever known for the dairy cow but it will not make up for lack of brains in feeding or business capacit.—M. E. Sherman.

MILO FOR DAIRY COWS.

Every dry land dairy farmer in eastern Calorado should plant an acre of milo for each cow that he milks and should cultivate it thoroughly to get as large a yield of grain as possible.

Milo takes the place of corn in feeding dairy cows and will yield an average of twice as much grain an acre as corn. In seasons so dry that corn will be a total failure, milo will usually yield 15 bushels of grain or more an acre.

The heads of milo may be snapped from the stalks and fed to cows giving milk. This is an economical way to feed this grain, as a cow has to chew a head a considerable time before she is satisfied to swallow it, and the more she chews it, the better it will digest.

The whole heads may be ground without threshing, and the small stems that hold the seeds form, when ground, a good material for diluting the meal and making it more easily digested.

The threshed grain may be ground before feeding. It does not pay to

Clip Your Horses Yourself

Stop paying high charges for work that you, or any man or boy, can do. There's no need to employ experts to clip your horses when you can clip them **yourself better, quicker, cleaner, safer and cheaper** with a

Stewart No. 1 Ball Bearing Horse Clipping Machine

It's an economy for the man who owns one or more horses. For, with a STEWART, there are no delays. The machine is always ready for use. Horses can be clipped more frequently and at **Regular Intervals.** The STEWART is *the* machine that lasts indefinitely and gives good service *all* the time. It never requires attention, and runs practically without friction or wear. A tremendous speed of the knives is obtained by slowly turning the handle—and a boy can turn the handle. (Another boy can clip the horse.) **Complete for $8.50.**

The price is for the machine ready to begin clipping horses with. It includes six feet of flexible shaft, the famous Stewart Clipping Knife and a liberal guarantee. Get one at your dealer's. If not there, write us.

feed unground, threshed grain, as the cow chews the whole grain but little before swallowing it, and a large proportion passes into the manure undigested.

Milo is a constipating feed, and for this reason, when fed alone, induces an unhealthful condition, which is increased if the other feeds are prairie hay and cornfodder, both of which have the same defect.

To overcome this difficulty some laxative, succulent feed should be given daily. Green cured, alfalfa hay is the best for this purpose, and a combination of alfalfa hay and the grain of milo makes a dairy ration that will produce cheaply a good flow of milk. Other good laxative feeds, well adapted for growing in eastern Colorado, are stock melons, stock beets, and sorghum hay, made from plants cut when in bloom.

Milo contains an excess of starch and is deficient in protein (flesh, milk and blood making material). It gives the best results when fed with alfalfa. The new settler on the Plains of eastern Colorado can raise sweet clover until his land is in condition for alfalfa.

Sow 10 to 12 pounds of sweet clover seed to the acre, and cut it when the first bloom appears. It will make a hay which, fed with milo, will force a good milk yield? Sweet clover cut when the plants are in full bloom, or later, is nearly worthless.

Many dry land farmers in eastern Colorado let their cows become very thin while dry during the winter. When cows are emaciated at calving time, the milk yield is reduced throughout the summer, no matter how good the summer feed. Dry cows kept in good flesh with milo will yield, after calving, more milk throughout the season.—H. M. Cottrell, Colorado Agricultural College.

DAIRYING MISTAKES.

Starting in with mixed or beef breeds and trusting to individual traits alone rather than individuality and heredity combined in one.

Selecting the cows in the season of greatest milk flow instead of on the basis of their yearly average yield of butter fat.

Trying to raise beef and butter from the same cow. This may be accomplished, but it is not dairying.

After having selected good, pure-blooded stock with records of heavy yearly yields, it is a mistake to expect that, under ordinary care, such as most farm animals receive, the cows will do much better than scrubs.

A dairy cow must be fed and sheltered. High bred, high keep.

Failure to provide silage or other succulent feed in winter is a grave mistake.

Failure to keep quarters clean, to have the cows well and warmly sheltered in winter and comfortably shaded in summer are all fatal mistakes.

The dairying chain is as strong as its weakest link, and luck will seldom make it stronger.—Western Farm.

SELECTING BREEDERS.

It is not too early to select the hens you intend using next season as breeders. It will be too late about the time you are ready to set the first eggs, if raising early and productive stock is your object. Then you will not know which pullets matured quickly; and laid early and persistently, nor the hens that hurried through the molt and came back to business quickly; now is the time to select these. Visit the hen house occasionally and band the pullets found to be laying; you will soon learn to know those that lay often without looking at their band numbers; these should be used as breeders next season.

Don't wait until hatching time to sell your surplus poultry; do it now—all the old hens and all but a few of the best males. As these mature and show their good points, cull again, reserving only enough to head a choice pen of the best laying hens and pullets. Build a small colony house on 2x8 runners and haul it in. Fifteen to twenty-five hens kept here will lay more eggs during the hatching season than the average farmer's wife will know what to do with.

A flock built up by careful selection and built down by careful elimination of all useless and unproductive members will show double the profits and give four times the satisfaction.—W. E. Vaplon, Poultryman, Colorado Agricultural College.

CHICAGO STOCK SHOW.

Pres. H. J. Waters of the Kansas Agricultural College, on a recent occasion expressed himself as follows:

"The International Live Stock Exposition, which will this year be held from November 26th to December 3rd, is the court of last resort in all matters pertaining to the improvement of live stock. It is the place where all controversies regarding superior merit are settled for the year, and as such contribute more to live stock improvement than any other single agency in America. As an object lesson it is unequaled on the continent. As a means of awakening interest in improved live stock, it and similar shows are indispensable. It is a liberal education in live stock production for any farmer, breeder or student to attend the International."

PROTECTING CATTLE FROM FLIES.

At this time of the year, much discomfort to cattle and loss to their owners is caused by flies and other insects. Feed becomes scarce at this season; and this, combined with fighting flies and ofttimes leaving such feed as there is to seek relief from the pest in the brush—or in water where this can be found—often results in a loss of weight in cattle.

In dairy herds, even where stables are darkened and the cattle kept in a part of the day, the loss in milk yields resulting from the annoyance caused by flies is often quite material.

Many different anti-fly mixtures and "dopes" have been used with more or less success. Several of those advertised have been used by the writer and found fairly efficient in keeping flies off animals for from 3 to 12 hours, varying with the nature of the mixture and the amount applied. The mixtures are usually applied most satisfactorily by means of a small hand spray-pump, which costs about a dollar. They can be thus applied in a very short time, and the only important item of expense is the mixture itself. Most of the patent mixtures cost from seventy-five cents to one dollar a gallon. Where considerable quantities are used, the necessary ingredients can

be purchased and the mixture made up at a cost of 30 to 50 cents per gallon.

One of the common mixtures is 3 parts of fish oil and 1 part kerosene. The fish oil contained in many of them costs about 45 cents a gallon in barrel lots, or 60 cents in ten-gallon lots, in Minneapolis.

Another good mixture is: 100 parts fish oil; 50 parts oil of tar; 1 part crude carbolic acid.

Another, recommended by the Kansas Station, is: 1½ pounds resin; 2 cakes laundry soap; ½ part fish oil; ½ part kerosene. Mix thoroughly and add water to make 3 gallons.

Oil of tar—a very common ingredient, and one that gives a pleasant odor and makes the mixture stick—can be bought for 20 cents a gallon in barrels, an 30 cents in 10-gallon lots.—W. F. Handschin, Minnesota Agricultural College.

NATIONAL WOOL GROWERS MEETING.

Portland is making special plans to entertain thousands of sheep raisers and prize members of their wooly flocks at the 47th annual convention of the National Woolgrowers' Association and Mid-winter Sheep Show, to be held here January 4, 5, 6 and 7. Ample facilities at the spacious National Guard Armory have been provided for housing the meetings of the association and downstairs in the drill hall pens will be placed for prize sheep entered in the show.

Premium lists have been issued and show a fine lot of prizes for exhibits of blooded animals. The premiums cover all classes and the show promises to be the largest and best ever held by the organization.

The Hampshire Association has provided $100 to be given as specials and the Rambouillet Association has given $300. Other associations will take the matter up at their December meeting and it is expected a liberal appropriation from about every association will be given. The Angora Goat Association gives $100 for specials, besides cups; two Oregon woolen mills, the Pendleton and Salem, are making special blankets for prizes and local stores will give premiums.

The Oregon Woolgrowers' Association is going to do its part to make the show a great success. Secretary Dan P. Smythe has written to Secretary Minton of the show that the executive committee has voted to present two cups from the value of $35 to $50 each, one for the champion fine wool ram exhibited and the other for the champion coarse wool ram placed at the show.

The wool tariff will be one of the live subjects that will be given much attention at the coming convention. That the necessity exists of fighting the effort to lower the tariff on wool is the statement of Secretary George S. Walker of the Association.

FEEDING THE FARM HORSE.

Probably the most important part in the care of the horse is the feeding. A large majority of the diseases among farm horses result from faulty feeding. So many make the mistake of not securing the best feed. Their trouble begins when partially matured, musty and dusty feed is used.

Several points should be taken into consideration when we decide upon the amount of feed; whether the animal is accustomed to dry feed, and if in good flesh or in a thin, emaciated condition.

A horse should not be fed a large quantity of hay and grain without exercise. Many think that because a horse is thin in flesh no work should be required of him. It is always best to work the flesh into the animal rather than to fatten him as you would a steer.

A good plan is to have a stated program as to time and amount of feed to be given. Horses, by all means, should be fed regularly. Hay requires time for mastication and digestion. For this reason the large percentage of the hay should be fed at night. Horses soon learn the manner of giving food and water, so it is best to have one feeder and have his plan followed out for all the horses. The horse should receive some water the first thing in the morning. After watering the horse is fed a small amount of hay and then given grain after all the hay has been eaten. By this plan the feed which is the most difficult to digest is left in the stomach, and therefore receives proper digestion. The noon feed should be given after the horse is cooled and has been allowed to rest for fifteen minutes or half an hour. A small quantity of water may be given soon after the horse is brought to the barn. Feed hay, and when the animal is thoroughly cooled, give all the water he desires, after which feed the grain. At night feed the same as at noon, only give more hay; in fact feed as much hay at night as is given at both morning and noon meals. When a horse is working hard and is fed large quantities of grain, it is found advisable, once a week to give a bran mash for the evening meal. The bran acts as a laxative and prevents indigestion and possibly a case of colic.—C. L. Barnes, Colorado Agricultural College.

If you think automobiles are spoiling the horse market try to buy a good horse and see what it will cost! That is a good test, and you will be surprised to learn what is demanded. For the past 10 years this cry of death to the horse business has been raised. It frightened many New York and New England farmers out of a good opportunity. Some of those eastern farms are ideal places for raising colts. The pasturage is fine the soil firm and hilly enough for good exercise, feed can be grown cheaply, and the farms are close to the finest horse markets in the world. Yet in spite of these advantages our farmers have let the horse breeding business go largely to western farms. If that western land worth $150 or more per acre can produce good horses and ship them 1,500 miles at a profit, it stands to reason that our eastern land worth $50 or less and under the shadow of the market can do even better. What we need are the horses and faith in the business. There is a great opening for breeding and feeding the heavier type of carriage horses or horses for the army. —Rural New Yorker.

One candidate for congress from a district in eastern Oregon made his campaign on the promise of securing from the reclamation service a more just proportion of the reclamation expenditures.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.

THE SACRAMENTO VALLEY IRRIGATION COMPANY

Exceptional Value

Price: $125.00 Per Acre

Has started a big dairy movement in **Glenn and Colusa Counties:** Dairymen from all over the United States are interesting themselves in these lands, where alfalfa produces 7 to 12 tons per acre, and silage corn from 25 to 30 tons. In fact, all crops grown in California make big yields in the **Sacramento Valley.** Oranges, walnuts, almonds, peaches, prunes, grapes, and fruits of all kinds yield in the greatest abundance.

SUCCESSFUL WHEAT GROWING UNDER DRY FARMING, Cover.
HARDY PLANTS FOR ARID CONDITIONS 499.
CITRUS AND TROPICAL FRUITS.—Melanose; Citrus Trees Require Potash; Trees in Europe: 500, 501.
DECIDUOUS AND SHRUB FRUITS.—Investigation of Gum Disease; Take Care of Farm Machinery; Canadian Fruit Outlook; Refused $30,000 for Tree: 502, 503.
ORNAMENTAL GARDEN. — Growing Lavender; The Peony and Its Culture; How to Use Caladiums: 504.
GARDEN AND FIELD CROPS.—Home Vegetable Garden; Enriching the Garden; Origin of Hubbard Squash: 505.
BEAN GROWING CONTEST, 506.
LIVE STOCK AND DAIRY.—Paying Herd; Milo for Dairy Cows; Dairying Mistakes; Selecting Breeders; Chicago Stock Show; Protecting Cattle from Flies; National Wool Growers' Meeting; Feeding the Farm Horse: 507, 508, 509.
EDITORIAL.—Stick to the Farm; Health in Country Regions; Roadside Weeds; Fruit Growers' Convention; Florida's Loss: 510.
AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast: 511.
PRACTICAL POULTRY CULTURE.—Petting Domestic Animals; Roup Cure; Shipping Dressed Poultry; How to Pick a Duck; Care of Poultry Houses; Poultry Show Dates; San Joaquin County Poultry Show; Alameda County Show; Shipping Crates; Fall Hatched Chickens; Dust Bath; When Fowls are Blind; Roosts and Nests: 512, 513, 514.
BEES AND THEIR CARE.—Wintering Back East: 515.
IRRIGATION AND FORESTRY.—A Practical Experiment: 516.
QUERIES AND REPLIES.—No Indication of Tuberculosis; Pasture; Mealy Bug; Guinea Eggs; Cypress Hedge; Tapping Water Pipe; Fencing Highway; Moving Irrigating Ditch; Use Teat Plug; To Remove Warts: 517, 518.
SONOMA COUNTY BY BIKE, 519.
GENERAL AGRICULTURE. — Alfalfa on the Dry Ranch; Preventing Weevil in Corn; Cure for Alkali; Alfalfa Care; Farm Implements: 520, 521.
HOUSEHOLD.—Common Things; One of God's Charades; Christmas Buying; Apple Recipes; Pants; Cleaning Laces at Home; Water Bag: 523, 524, 525.
PRODUCE MARKET.—Los Angeles Market, San Francisco Market; Deciduous Market, Citrus Market: 526, 527.

Stick to the Farm

"Rural Manhood" is the name of a new magazine issued by the Young Men's Christian Association of New York State as one of the present day efforts toward improving country life. In it we note an article on progressive California which calls attention to much of the good work being done in his state. The magazine is filled with articles such as "Why Boys Leave the Farm," "Chautauqua Farm Boys Camp," "Rural Life in China," and others.

One short article touching upon the disappointments of city life often experienced by the country boy who tries it, mentions the following incident, quoted from a daily paper. It is to be hoped the warning there given may prevent some country boy from wishing "another chance."

"Locked in his cell at the station house last night, young Johnson, who snatched a lady's pocketbook on Fillson street and was captured by the crowd in pursuit, was indeed the picture of misery. He acknowledged that the name he gave was an alias, and said that he belongs to a respectable family in the country. It appears that he lost his position as shipping clerk because of dissipation, that he gambled away most of the last week's salary and then used the rest to go on a spree. Yesterday morning he found himself out of money and friends, with no work and hungry. He grew desperate and committed the crime.

"'I just got- in with the wrong crowd when I came here,' he said.

"The only ray of hope that seemed to enter cell No. 8 was when the forlorn occupant looked up and asked the reporter, 'Do you reckon the judge would give me another chance.'"

Health in Country Regions

An editorial in World's Work calls attention to the fact that recent death rate bulletins show that in cities and states requiring registration of deaths, during the past year fifteen persons per thousand have died. This is thought to be the lowest death rate in the history of the country. In 1903 the rate was 15.4 per thousand. England and Wales go us a little better with a rate of 14.5. It is claimed that this lessening of the rate is due in part to the fight upon tuberculosis, but the reason for referring to this editorial in our columns is to call attention to the fact that the total death rate in the country is greater than that in the city, that is so far as may be determined by means of the inaccurate records kept in most country districts. One doctor of the Virginia State Board of Health reported that sanitary conditions in neighborhoods of prosperous and reasonably intelligent country folk in that state were often appalling.

"In a word, the preventive measures and precautions that have become common in cities are yet unknown in many parts of the country. One naturally asks, 'Why, then, do the country people not die by scores and hundreds?' The answer is, 'They do.' Where accurate statistics are required, there is no knowledge on the subject. Preventable deaths and diseases are accepted as inevitable, and the presence of a few very old people in a community (and you can find them in any part of the world) is regarded as proof positive of the good health of the masses. Here is one of the pressing problems of country life."

Roadside Weeds

Horticultural commissioners have been confronted with a difficulty in caring for weeds which are pests along country roadways. Notice to acreage owners to abate the nuisance of Johnson grass, morning glory or other serious pest is met with the statement that it will return immediately from the infestation permitted along the roadsides. Whether this work should be done by the county or the abutting property owners is a question not yet satisfactorily settled. The county horticultural commission has power to order the cleaning up. but who supplies the funds? It is not the custom to take money for this purpose from the road fund, which is never too large, and the abutting property owner feels it unjust to throw the expense on him. This situation has been met in Los Angeles county by the board of supervisors taking money from the general fund; then notice is served on property owners alongside and the usual excuse being taken away there remains no reason for not abating the nuisance.

The best method of destroying Johnson grass is yet to be found. The laborious plowing and raking out of roots and work with the grub hoe is used wherever it is possible. Chemical tests are also being made, but nothing along this line has resulted satisfactorily. A new chemical is now being offered, but what merit it has we are not informed.

Fruit Growers Convention

We have from O. E. Bremner, secretary to State Horticultural Commissioner Jeffrey, announcement of the Thirty-eighth California State Fruit Growers Convention at Stockton, December 6-9. The Stockton Entertainment Committee consists of Messrs. J. E. Hall, D. B. Morrill, and Frank L. Williams.

Regarding the program which is not yet fully arranged the Call says:

"This fall convention is in a measure the summing up of the fruit season of the year from both a cultural and marketing aspect, and with these two phases before us we will work out the problems most likely to confront us the coming season.

"The success achieved during the past year by the deciduous fruit growers in the northern portion of our state is largely accountable to the widespread influence of the standardization movement which was inaugurated last fall; how great this influence has been on our industry and is to be in the future we hope to have clearly set before us during the day's session devoted to this important subject. The reports and papers on this topic will be taken up and discussed by those most intimately associated with the movement the past year, and in this connection we wish to say that as ample time has been provided for the discussion of all points brought out, it is to be hoped that every one will come prepared to take an active part in this portion of the programme. We realize that it is quite impossible to present every topic of particular interest that should engage out attention at the present time, and we must, therefore, select those which will reach the greatest number and produce the most permanent good. The subject of standardization stands alone in its general importance, and is sufficient to justify every effort on your part to attend.

"The programme as outlined presents other important matters for your consideration, and it would be incomplete without a session devoted to grapes, particularly as San Joaquin county is famed as the home of our renowned Flame Tokay. Wine and raisin grapes will also come in for a portion of this session.

"Among other timely subjects will appear squirrel eradication, colonizing northern California, agricultural education, agricultural legislation, and special subjects on such topics as soil bacteria and insect problems, besides many others of equal importance and interest."

Florida's Loss

Many California fruit growers will recall meeting Dr. F. W. Inman who was at the head of the Florida delegation of orange growers visiting California a year and two years ago, for Dr. Inman has made two trips of investigation into conditions in California orange groves and packing houses. It is with regret that we chronicle his death at his home at Florence Villa, November 7th. Dr. Inman was the father of the exchange movement in Florida and its inspiration since its founding. The fruit growers of Florida can erect no greater monument to this man than the perfecting of the organization to which he gave so much energy. From the resolutions adopted by the Florida exchange we clip the following:

"His life has been full of unselfish devotion to the interests that concern us as an organization, community, and state. His intiring efforts in behalf of the Florida Citrus Exchange have endeared to us his memory, and will cause us to miss his encouraging presence at our gatherings.

"His was the master mind which conceived and brought to a happy conclusion the crowning event of his busy life, our Florida Citrus Exchange and he leaves to us the burden of carrying the work to a successful conclusion.

"Let us not shirk the responsibility, but let the work which we shall endeavor, and eventually accomplish, bear testimony to the hopes and wishes of our departed friend.

"His integrity, his benevolence, his sterling character, stand as a monument to his memory, and a fit example for our emulation; and should nerve us to our greatest efforts to consummate and perpetuate the work he so well began."

The quality of corn is given by the Crop Reporting Board of the Department of Agriculture this year as 87.2 per cent as against a ten year average of 84.4. Potatoes are slightly better than the ten-year average. Wheat shows up well this year with an average weight of 58.5 pounds per bushel as against a weight of 57.9 last year and 57.6 ten-year average. With barley the average weight per measured bushel is 46.9 pounds.

Wenatchee Valley apple growers pooled some 275,000 boxes of apples which they disposed of to one purchaser at $1.75 to $2.25 per box. The Valley will this year have its greatest output. It is estimated that it will reach well up toward 3,000 cars.

Agricultural News Notes of the Pacific Coast

Northern California

Davis Tokay grapes have proven a very profitable crop this season.

A Tehama county 2000 acre orchard recently sold for $50,000.

Sutter county broom corn growers had a most profitable crop this year.

The new town of Gerber, Tehama county, has just established an alfalfa meal mill.

Poultry dealers at Chico, Butte county, predict a 30 cent price on holiday turkeys.

Stockton's Poultry Show last week was pronounced one of the most successful events of its kind.

Castro Valley near Haywards has long been a poultry center and is now appealing for more dairies.

The next meeting of the Sonoma County Pomona Grange will be held at Petaluma next Saturday.

Humboldt and Mendocino counties have been given light showers which have freshened up the pastures.

The farmers of Davis, Yolo county, are organizing the Farmers Telephone System, to be a purely mutual company.

Sonoma county was visited by a killing frost on the 11th. Tomatoes and similar tender plants were killed to the ground.

A Corning poultry raiser who started seven years ago with $500 capital now sells 7500 chickens and thousands of eggs every year.

Marin county dairymen are investigating as to advisability of transferring their activities to the Glenn and Colusa county sections.

The tract of 18,000 acres of swamp land north of McArthur, Shasta county, is to be reclaimed by the construction of a four and a half mile canal.

A new fruit purchasing company is offering $40 per ton for Sebastopol berries. The Berry Growers Association netted last year about $63 per ton.

Petaluma's Poultry Show will depart from the usual poultry show custom and elect a queen to preside during festivities. The show dates are December 7-10.

Representatives of various Sonoma county Granges have appeared before the county supervisors and urged the appointment of a county forestry commission.

The Shasta County Farmers Protective Association at Anderson at a recent meeting received report from a committee that the smelters which have installed smoke condensers are still giving out poisonous fumes.

Rocklin, Placer county, shipped its first car of oanges on November 1st.

Examinations for forest rangers for the Stanislaus Reserve were held last week and eight applicants have forwarded their examination papers to Washington.

The President has signed a proclamation eliminating about 3000 acres from the Stanislaus National Forest and adding to it nearly 7,000 acres. The area eliminated is chaparral land on the west side of the North Fork of the Tuolumne.

Central California

A few small sales of raisins have been made as low as 2½ cents.

Tulare county Emperor grapes are selling well, some commanding well up toward the $2,000 per car mark.

The Pajaro Valley has already shipped out about 3,000 cars of apples. There are about 1,000 cars yet to go.

President Barrett of the National Farmers Union addressed the farmers of Fresno county at Fresno last week.

Raisin growers at Clovis, Fresno county, have declared their intention of holding raisins until a better price prevails.

Horticultural Commissioner Volck of Santa Cruz county has been appointed lecturer at the State Farm at Davis.

A big exhibit of Turkish tobacco from eastern Fresno county is being made at the Chicago Land & Irrigation Congress.

The Kerman Creamery paid its patrons 38 cents for butterfat for last month and predicts 40 cents for the coming month.

The president of the National Farmers Union has announced that that organization will take up the fight against the raisin seeder patent.

Secretary Miot of Tulare county Board of Trade reports the arrival of fruit exhibits in Chicago in excellent condition and much interest taken in the exhibit.

An orange grower at Porterville, Tulare county, took advice from the State University as to soil analysis and cultural practice and secured very profitable results from his grove.

It is estimated that the 493 fires in the forests of this state during the last year burned over 108,000 acres of private and 220,000 acres of public land.

The stockholders of the Danish Cooperative Creamery at Fresno will build a new plant, the old one having been built twelve years ago. The new one will have much greater capacity.

The Tulare County Forestry Board is now organized with John Tuohy of Tulare, President, and W. A. Gates of Dinuba, Secretary. The Board will have charge of the forests and roadside trees.

The Committée of the Fresno Chamber of Commerce investigating shortage of this year's crop, states that Muscats are 19 per cent short; Thompson Seedless 26½ per cent; and Sultanas 17 per cent.

A suit is on in Santa Clara county courts brought by a fruit grower against a buyer for damages because of rejection of fruit contracted for, 172,000 pounds of prunes, at a contract price of 4¾ cents. The first prunes delivered, which were all but 40,000 pounds, were accepted at the full price, the later offerings being rejected because of claimed inferior quality. It is a significant fact, however, that the price had materially declined meantime.

Southern California

Imperial county farmers are planning for a big fair at El Centro, December 15,17.

The Sisquoc Investment Company has just completed a large dam near Santa Maria.

The best cotton sale reported from the Imperial Valley up to this date is 100 bales at 14 cents.

A section of Escondido High School is engaged in practical agriculture as a part of its course.

San Bernardino county's horticultural commission is giving special attention to Russian thistle inspection.

The first shipment of cotton from the Imperial Valley was from Brawley, the car bringing $3,000 to growers.

San Pasqual Valley in San Diego county is greatly increasing its wealth by the sinking of many artesian wells.

Farmers of Antelope Valley, Los Angeles county, will plant extensively of orchards and alfalfa during the coming season.

Southern California turkey raisers held for stiff Thanksgiving prices, many of them commanding as high as twenty-six cents.

The 1400 acre park which is to be the site of the Panama-California Exposition at San Diego has been named Balboa Park.

The president of the National Farmers Union visited the Imperial Valley last week making addresses at El Centro and Brawley.

Agricultural products of Santa Barbara county aggregated $10,000,000 during the past year. Beans are the principal factor.

Owing to scarcity of labor cotton growers of Imperial Valley are compelled to pay $1.25 per hundred pounds for picking.

Much mesa land near Palo Verde, eastern Riverside county, is being purchased for the planting of oranges the coming season.

Norwalk, Los Angeles county, shipped 450 carloads of beets, the farmers receiving in the neighborhood of five dollars per ton.

The agricultural productions of Orange county for the past year aggregated about $13,000,000; $2,000,000 of this was from sugar beets.

The Riverside County Horticultural Commissioner has a big force of men working with fumigating tents, about 1200 acres per month being covered.

A Redlands manufacturer has perfected an auto-cultivator which has been tested to the satisfaction of many orchardists who saw its recent trial.

A veterinarian of the local branch of the Bureau of Animal Industry reports Southern California to be freer from Texas fever tick than for many years.

The walnut harvest of the various southern counties is practically ended and while running lighter than anticipated earlier, exceptionally fine stock has been harvested.

The Coast

A farmers institute special will traverse northern Utah in early December.

Spokane apple growers are now hauling their fruit to market through the snow.

The Spokane county Farmers Union has decided to build a large warehouse at Spangle.

One stock man in Maricopa county, Arizona, is introducing a number of high-bred Angora goats.

Ninety five per cent of the fruit of the Inland Empire in eastern Washington, is grown under irrigation.

The Record at Paradise, Arizona, reports examples of dry farming which have been very successful.

Wenatchee, Washington, plans to boost the sale of its apple lands and to that end has raised a fund of $16,000.

Grapegrowers of Columbia and Lower Yakima Valleys, Washington, held a meeting at Kennewick last week.

The Moro Province Agricultural Fair will be held at Zamboanga on the island of Mindanao, February 1-7.

The Department of Agriculture is doing experimental pre-cooling of apple shipments in the Willamette Valley.

Blue Pearmain apple trees over 50 years old at Waitsburg, Washington, are still bearing exceptionally profitable crops.

Cashmere, Washington, is making an exhibit at the National Apple Show which will later be transferred to Chicago.

The Thirteenth Annual Convention of the Oregon State Woolgrowers Association will be held in Portland, January 3rd.

North Yakima, Washington, produced on its farms during the past year $17,050,000. Of this $4,000,000 was for apples.

It will require 50,000,000 feet of lumber to construct the 10,000,000 boxes required for the Inland Empire apple crop of 1910.

The rainfall in the Inland Empire of Eastern Washington was heavier during the month of October this year than ever before.

Cattlemen at Wilcox, Cochise county, Arizona, are making large shipments of cattle, largely to the Los Angeles market. This county has shipped more than 20,000 cattle during the present season.

The port of Zamboanga, P. I. showed agricultural exports during the month of September amounting to 95,605 pesos, or more than double those of the same month the preceding year.

Representatives of large interests from all over the Pacific Coast met in San Francisco last week in the Pacific Coast Congress to discuss matters of general interest and especially urge such matters as would be beneficially discussed in the national congress. Representatives of ten states attended.

The worst thing we have to contend with in getting new customers to try

West Coast Egg Food

is the "stuffs" that have been put on the market called "egg foods," largely composed of unsound grains, mill refuse, and cheap, very cheap, Japanese rice bran and such offal. When we once get a trial of "West Coast" we have no further trouble. No such stuffs in ours. We are winning out in great shape by making first-class feeds at prices as low as those "cheap" ones. Try "West Coast" just once. 75-lb. sack only $1.80, or $45.00 per ton. If not sold by your dealer, send to us. Or, if you are distant from Los Angeles and have good grain products cheaper than to ship them in, you can make your own Egg Food as good as anybody's.

Egg-More Booklet

tells you how. It is free. Send for it. Send us addresses of 5 persons in your vicinity who have fowls, and we will send you an Anchor Egg Separator. Or, for 20 addresses, we will also send The Poultry Manual, a book well worth 50c, both postpaid.

West Coast Mill

Office and Salesrooms, 115 Winston St.
Los Angeles, California

Coulson's
EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying powers and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the famous Coulson products and gives valuable information about Poultry Raising.

Coulson Poultry & Stock Food Co., Petaluma
Germain Seed & Plant Co.,
Distributing Agents for California

MORE CHICKENS—MORE EGGS AND MORE PROFITS

Big demand for poultry products at top notch prices—makes the chicken business *better than ever*. Go into it *right*. Pacific Coast poultrymen testify that

Cyphers Incubators and Brooders

the World's Standard Hatchers, give the *best results* in meeting Coast conditions and requirements. The Cyphers is a genuine non moisture incubator; self regulating, self-ventilating. It is used by more Government Experiment Stations, by more poultry fanciers and on more big and successful poultry plants than *all other makes of incubators combined.*

The Cyphers Is Particularly Adapted to the Pacific Coast Climate

You can rely upon the results from the Cyphers—*hatch after hatch.* Mr. C. Flewelling of Petaluma, Cal. uses 14 Cyphers and averages 75% of the total number of eggs set. Bertha M. Story of Oregon City, Ore. says "I rarely have less than a 90% hatch of good strong chicks." Cyphers Incubators and Brooders are fireproof and insurable. We guarantee Cyphers Incubators and Brooders absolutely and are right here on the coast to back our guarantee. Write today for our big handsome book: "Practical Poultry Raising" and 1911 catalog of Cyphers Incubators, Brooders and Poultry Supplies.

Cyphers Incubator Company, Dept. 46, Los Angeles, Cal. Also Buffalo, N.Y.

Practical Poultry Culture

PETTING DOMESTIC ANIMALS.

There is a difference of opinion as to the advisability of petting the live stock and animals on a ranch. Some hold that cows or horses, if fondled much and allowed to rub noses too freely with people are apt to become unruly and hard to manage. Not because they are afraid or wild, but because they are not. They have had so much association with the ones by whom they are soon to be brought under control that they have lost all respect for them.

They are like children who are given the hammer and nails, the cut-glass and looking-glass—they soon turn the lack of authority into lawlessness and cause great damage. I have seen cows that had been raised as pets, toss children over the fence with no more thought as to the effect that such tossing would have on the youngster than a wild bronco steer would have had.

Horses that have been raised around the back door, and fed apples and plug tobacco, and allowed to bite the arms and hands of the donors in friendly play, have sometimes developed into the most artful biters and kickers when grown. Of course, it is all done in play; but it counts very little to mankind in general when their brains are being kicked out whether the intent was playful or aggressive. The result does not justify any extenuation even if the intent was not unkind.

The result of much petting upon the owners themselves is demoralizing, for it makes the animal so much like a member of the family that it is almost impossible to sell it, even when a real necessity occurs for such a transaction.

We have often kept many an old hen and rooster until their period of usefulness was long past, and until, in fact, they died of old age, rather than sell them or consign them to a fricassee. It is senseless beyond conditions of excusing; but we are such creatures of sentiment, the prey of our own emotions, that we can not, when once these are set in motion, reduce them to a power of common sense and reason. Maybe it is just as well—in some ways—that we can not, but it causes us many an inconvenience and pain because it is so.

Trading on the superstition that a pig raised a pet will not be a nuisance, a sow was once raised by friendly folks. She was as gentle as a lamb or young kitten, while a young shoat but when maternity came upon her, she chased every one off the plantation, and had the hired men climbing trees and yelling for the dogs and the shotgun, before they could get back to safety. It was only by the most skilful maneuvering that she was finally induced to come into a pen and be providently provided with safe selter and food. She knew mankind and feared them not.

It is the same with cows. We have one beautiful big black cow, who is so gentle that the children ride her, and she will follow the men all over the place to have her head and neck rubbed. Well, you should see her patrol the yards and run for a half mile, straight as an arrow, after people, dogs and everything, when she has a calf. We call her, at such times, "Rough-house Kelly," for she moves like a whirlwind, and though she might not intend to knock down a friend when after a dog, the damage is just as great as if she really intended so to do.

It may be that the advantages in other ways offset the disadvantages herein mentioned, but it would seem more practical not to pet the stock too much, but treat them with kindly care and respect.—E. M. Stetson, of Lankershim, in Farm Journal.

A ROUP CURE.

It is one thing to raise a fine bunch of fowls and quite another thing to dispose of them in the pink of condition. Sick chickens are a very common thing at the approach of winter and unless you give them good attention you will probably lose heavily. Roup often makes its appearance where fowls are carelessly managed.

You can scarcely pick up a poultry journal but what you find something written upon the subject of roup, yet inquiries come to the writer almost daily asking for a cure for roup, etc. Roup is an enemy to hundreds that are striving to make poultry-keeping a paying proposition. It must be remembered that sickness of any kind in fowls is more easily prevented than cured. What causes roup any way is the question that comes to every breeder that encounters this most dreaded disease. In a majority of instances the fowls are allowed to crowd in the broad coops during the late fall almost like sardines in a can, consequently they became heated to the highest degree, come out in the cold frosty air and the result is colds and roup. Just as certain as fowls are allowed to "crowd" in the chick coops just that certain you will have roup and plenty of it.

Where fowls have been suffering with roup more or less for two or three years, I know of no surer or quicker remedy than to rid the premises entirely of all kinds of fowls for at least six months until you can thoroughly clean the place, destroying every germ of the disease before stocking up again. In restocking your place see that your new fowls have no trace of the disease. I am aware that if you have a choice lot of high-class birds it would be hard to dispose of them and get started up again with their equal in quality. But I can see no other way out of it, remember where you have roup thoroughly stamped into your flock for several generations back. It is like consumption in the human family, simply impossible to cure. In fact I have seen fowls suffering with genuine consumption. Where the disease is so thoroughly stamped in your flock it would be wise to kill and burn. Where roup apears in acute form the first thing to do is to separate all the sick fowls from the well ones, take a sewing machine oil can and force six or eight drops in each nostril. Repeat this treatment for three or four days each night and morning and give one tablespoonful of milk with three grains of bromide of potassium in the milk.

This treatment is a reliable cure for roup in acute form but where the disease is so firmly fixed in the sys-

Go In and Make Money

Poultry offers the surest, easiest way of anything that's open to you. Don't waste *all* your time considering. Go in and *make* it win.

I have started over 61,000 people the Queen Incubator Way. May I do the same for you? Get my offer on

The 1911 Queen Incubator

he incubator that makes money for poultry aisers. Take one and *try it* for 60, 90 or more ays and prove for yourself that it is the atcher I claim it to be. I take all the chances. *pay the freight*, too, and give a 10 year guarntee now. It is my way of showing people hat they can accomplish with Queens.

Get the 1911 Queen Book

he New Queen Poultry Guide and Catalog larger and finer this year than ever. It ells how to make money with poultry and ow to get a Queen Incubator on the most enerous terms ever offered. Let me send ou my great book to tell you about Queens nd Success. An infallible guide; no other ook like it. *Free and postpaid.* Address

OUR TRAPPERS GUIDE FREE

tem as to transmit the disease from one generation to another, nothing will cure the disease.

Where the fowls show a slight cold and the weather is damp and chilly, I give a pinch of quinine to a gallon of mash made of boiled rice and wheat bran. One teaspoonful of quinine to a gallon of mash will make a good stimulant for the fowls during a sudden change in the weather.

I am confident I have saved many by using the foregoing treatment. I procured the treatment from a poultry journal several years ago, which shows the advantage of subscribing for and reading good poultry literature.—J. C. Clipp in Poultry.

SHIPPING DRESSED POULTRY.

After the fowls have been dressed and are thoroughly cooled, they will be ready for packing. Poultry dressed for market should be kept off feed at least 24 hours previous to slaughter and should not be drawn before it is packed for shipment. The action of the air on the inside of the fowl will cause it to spoil, and make it impossible to keep in good condition. Use a flat box, in which two layers of poultry can be packed. Wrap the head of each bird in paper, so that any blood which may be left in the head will not come in contact with the body of the fowl and soil it. In some cases the whole bird is wrapped in wax paper.

Start a layer in the bottom of the box; take each bird separately and fold the head to one side, and place it in the box with the head up. Continue in this way until the bottom layer is filled. Put in the upper layer the same way, except that the head is in the middle and the side of the breast is up. If this method is followed in packing, either side of the box may be opened when it reaches the market, and a nice, uniform lot of poultry will meet the eye of the purchaser.

The poultry may be packed in barrels or larger boxes; but small flat boxes are preferred, because they are easier to handle, and there is also less danger of spoiling while they are being shipped.

It is a good plan to establish a permanent trade with some commission firm, meat-dealer, or large hotel, to supply them with poultry. This will insure a better price than when shipped only occasionally.

Poultry should be sent by express, so as to be on the road the least possible time. The cases, when shipped, should be plainly marked for whom and from whom they are; the number of birds in the case, and the weight.—W. H. Tomhave, University Farm, St. Paul, Minnesota.

HOW TO PICK A DUCK.

One of our ranchers wants to know how a duck should be picked and I shouldn't wonder if there were many others who would like to know, for there exists an idea that getting the feathers off a duck in a reasonably short time is wellnigh an impossibility. Once a lady told me how she and her husband stood watch and watch on the job of removing a duck's feathers and worked far into the night, and she warned all and sundry against the duck proposition because of that experience. In reality it is not job at all if done properly. Success principally depends upon killing the duck very dead, immediately and all at once, so that it dies instantaneously, for should the fowl die slowly the muscles tighten and the feathers are held with the grip of a vice. A good way is to use a short, heavy club, rapping the bird smartly on the head with it. Then stick in the throat with the killing knife. The fowl should die instantly and the muscles holding the feathers relax. Pull out the tail feathers, then wet the hand and push most of the feathers off. Professional pickers on the duck ranches shave off down and pin feathers with a sharp knife, only a few feathers have to be pulled out when an expert does the job, and 10 minutes per duck is all the time required to kill and pick.—D. Tancred in the Ranch.

CARE OF POULTRY HOUSES.

A well-kept chicken-house is one that is cleaned often. Some poultry-raisers clean their houses every day and would not think of neglecting this job.

When the house has been thoroughly cleaned, whether this is done every day or not so often, sprinkle the floor generously with air-slaked lime and dust a little in the nest. If there are insects in the house smoke it with sulphur and then wrap a cloth around a stick and apply coal oil to the roosts. It is also a good plan to whitewash the house on the inside occasionally. When a chicken-house is taken care of in this way it never gets in bad condition and the fowls will be comparatively free from parasites.

Another thing that will add to the comfort and cleanliness of the chickens is a box filled with dust and ashes where they can take a dust bath. This will need to be replenished quite often, for there will be chickens in it most of the time and the dust will be carried away in their feathers.—Michigan Farmer.

If coops are not well ventilated the growing chicks will be too warm during the night and will sweat out more strength during the hours in which they ought to rest than they will gain under the most favorable conditions during the day.

SAN JOAQUIN COUNTY POULTRY SHOW.

The management of the San Joaquin County Poultry Association is justly gratified at the results of the show pulled off in Stockton November 9-12. There were over 1200 individuals exhibited and many of them were high scoring birds and the average was exceptionally high. As between farm raised poultry and town-lot exhibits we fear the town-lotter had the advantage. The farmer may be too busy with his general work to stop to exhibit at a poultry show, but we know he will be much benefited by making comparisons such as are in evidence at an exhibition like this. Practically all classes were filled at this show, but perhaps the bantam fanciers were the largest exhibitors and in this class some almost perfect specimens were shown. The winners of specials were:

Grand prize for highest scoring bird in the show—J. Wildreth Crow of Oakland.

Cup for best display of pheasants—John D. Gall of Stockton.

Henry Lonjers cup for highest scoring male in American class—Charles R. Bliven of Santa Cruz.

Hoffman Cafe cup for highest scoring bird in Asiatic class—William A. French of Stockton.

Albert B. Parker cup for highest scoring bird shown by amateur of Stockton—Not yet awarded.

James H. Kroh cup for largest display of black Minorcas—William A. French.

Otto von Detten cup for highest scoring bird in Mediterranean class—O. E. Crawford of Stockton.

Logan enlarged photo to highest scoring white male, bantams excluded—William N. Ingram of Fruitvale.

Walter Sibley cup for largest display of one variety by resident of San Joaquin county—Eugene P. Sabin of Stockton.

Cup for best bird in Dutch class—C. G. Siegfried of Alameda.

Eugene D. Graham cup for best Cornish fowl in show—William T. French of Stockton.

Cup for largest display of turkeys—Ed Hart of Clements.

Harry T. Fee cup for largest display of ducks—William A. French of Stockton.

Ben M. Woodhull cup for best barred Plymouth Rock cockerel and pullet mating pens—Eugene P. Sabin of Stockton.

Hammond & Rardley cup for best pair of Barred Plymouth Rocks—Eugene P. Sabin of Stockton.

Coulson Poultry and Stock Food Company cup for best particolored cock, cockerel, hen and pullet—Eugene P. Sabin of Stockton.

Eugene P. Sabin cup for largest display of Leghorns—George W. Poppelwell of Stockton.

George H. Croley Company, Inc., cup for largest display of bantam—A. A. Arnold of Stockton.

Cup for largest display of Orpingtons by resident of San Joaquin county—W. D. Garden of Stockton.

Medal for best display of pit games—Asa M. Clark of Stockton.

Flatiron cup for 10 highest scoring birds of one variety—William H. Ingram of Fruitvale.

J. L. Phelps & Co. subscription to Daily Independent for highest scoring particolored chicken—Ben M. Woodhull of Fruitvale.

George Gorman cup for largest display of White Orpingtons—W. H. Ingram of Fruitvale.

Major Reibenstein cup for largest display of Wyandottes— A. L. Jenkins of San Rafael.

R. L. Wooster cup for highest scoring bantam in show—J. W. Crow of Oakland.

Law T. Freitas cup for largest display of Buff Orpingtons—W. S. Sullivan of Agnews.

Cup for best pen of Buff Cochin bantams—Ben M. Woodhull of Stockton.

American fence construction company cup for best bird exhibited by member—Ben M. Woodhull of Stockton.

Cornelius Leonard cup for best display of Anconas, L. M. Moore, Stockton.

Wm. H. McKay cup for best Houdans was won by Wm. A. French, Stockton.

The John D. Gall cup for largest entry outside exhibitor, Wm. A. Ingram.

ALAMEDA COUNTY POULTRY SHOW.

This is the week of the Alameda County Poultry Show. Fanciers around the Bay, and then some, are crowing over ribbons blue and ribbons red. Besides the various national associations are making handsome offers so that the contest is out for the handsome birds of the state.

SHIPPING CRATES.

Shipping crates should be light and durable. They should be commodious, large enough to accommodate the fowl or fowls to be shipped in them. Crates that are at least two feet in height are to be commended. A foot of ground or floor space should be allowed each fowl. A crate square or oblong is the usual shape and should be ventilated near the top on the sides. Handles may be added to assist those who handle the crate while en route.

The best material for a crate is white pine, for it is light and strong. The corners of the crate should be reinforced with posts as here is where the most strain will come in handling it. The cover may be fastened in with a padlock or a hasp or some device of one's own invention; but the padlock will prevent one's exchanging birds during shipment.

It is a good plan to paint all shipping coops or crates an attractive color, together with the names of your plant or your own name and address for in this way you would advertise your business. Have the words: "Return to" precede your name and address so your crates will come back to you. The express companies make no charge for returning empty crates.

It is a poor idea to use berry crates, dry goods boxes, or anything one can find in which to make his shipments Such a course looks slovenly to the outside world and makes a poor impression on your customers. "What is worth doing at all, is worth doing well." Endeavor to use uniform crates, that appeal to the eyes, and they will attract attention everywhere and bring you business wherever they go.—Successful Farming.

FALL-HATCHED CHICKENS.

The demands of the market now require spring and fall hatching of chickens. Formerly it was all spring hatching, but the change and great increase in the demands for fancy poultry show that the fall hatch is almost as profitable as the early spring product. Some practical breeders have found that the late hatched females lay the largest and most eggs and produce more eggs during July and August than do stock hatched in February and March which begin to lay in October. It is safe to say that it depends upon when and how the chickens are to be turned off whether or not they should be hatched in August and September or even in July. Males hatched from July to September make the best market poultry in February, March and April when they bring extremely high prices.—Field and Farm.

A DUST BATH.

When fowls are confined in winter they should have access to some kind of dry and dusty wallowing places. If such are given them they will generally keep themselves free from lice Quantities of dry dust or earth should be gathered in the fall so that it may be given to the hens during the time they are compelled to stay indoors. A box of common six-inch boards, about four feet square, placed where it will remain dry, filled with dry dust, into which a few drops of carbolic acid are sprinkled, will furnish the hens of an ordinary yard with rooms and means to keep themselves free from lice and their flesh clean, which will result in better health and more eggs—Kansas Farmer.

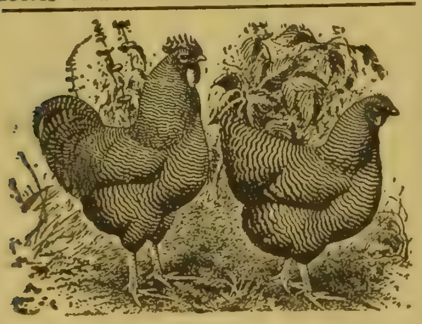
WHEN FOWLS ARE BLIND.

At all seasons of the year both grown fowls and chicks sometime appear to be blind. The cause ma be due to disease or to drafts of ai at night. In cases of this kind, th eyelids are often stuck together s firmly that the birds cannot ope them without assistance, and whe both eyes are in this condition the cannot see to eat readily, therefor lose flesh for want of food. Thes fowls can often be saved by dippin their heads in clean warm water an washing their eyes open, then anoin ing with vaseline.—Farm and Ranc

ROOSTS AND NESTS.

Roosts as well as nests are be made removable. It facilitates clea ing out the droppings and the pol are more easily whitewashed. Son of mine are hinged to the wall they may be hooked up out of t way.

Careful attention to roosts a nests is essential to good results all times, but particularly so duri the winter months, when the he are confined to the houses much the time.—Agricultural Epitomist.



To the Poultry Raisers:

Do you want sick, mopey chickens, or do you want strong, healthy ones?

Above are the kind of healthy chickens found on a ranch where Merval is used. Why not give your chickens Merval and have strong, healthy birds like these?

Merval will cure Roup in a week, and other diseases such as Canker, Chicken Pox and Diarrhoea in ten days.

Merval is also a fine tonic for run down hens. It puts them into condition again, which means more eggs.

Get a can from your dealer today. If he does not sell Merval, send us one dollar and we will forward you a one-pound can, postage paid.

Do it now. Remember, Merval won't cure dead birds.

Agents—C. H. Werdig, Sebastopol; Geo. P. McNear, Petaluma; Riverside Poultry Co., Riverside; J. A. Reinhart, Hollister; H. W. Thielsen, Oregon; A. W. Huskins, 713 Waterloo St., Los Angeles.

Bees and Their Care

WINTERING BACK EAST.

Much interest was shown in the following paper read at the last Los Angeles County Beekeepers Club, by Mrs. H. G. Acklin of Glendora. It has but little of California methods, but shows necessary work of Eastern beekeepers of which the Californian knows nothing:

* * *

I do not intend to draw comparisons, as all beekeepers here know the methods used in this state; but simply tell you how the wintering problem is met in some other states.

In Minnesota, and all through that section, if wintering could be successfully and with a certainty coped with, I believe a happier lot of people would be hard to find than the beekeepers of that region. There are many women beekeepers and that is possible; as bees are kept right at home. My queen-raising apiary was in the back yard and we lived on the corner of two busy streets.

Foul brood has done considerable damage in the past few years, but even that dread disease can be successfully met and disposed of, while the uncertainty of wintering is always confronting the beekeeper. Many people try bees for a year or two, but are unsuccessful in wintering, so give them up forevermore, thoroughly discouraged with the business, all on account of the wintering problem.

Very few bees change hands in the fall, although the price is much less at that time, because of this wintering uncertainty. I never advised a beginner to buy bees in the fall, although we always had bees to sell.

We wintered bees in three ways and finally, after much experimenting and some heavy losses, succeeded in getting them through nearly all right. A cave at the Snelling apiary took the lead for certainty, as we had not lost a colony there for several years before I left. But the young man who bought that apiary lost nearly all of his bees the next winter.

The next best way was in the cellar under our dwelling house, which held about 300 colonies, but was not as dry as the cave. Here we removed covers and put on quilts and tiered the hives up at a slant so the dead bees could be rolled out of the entrance. At the cave both bottom and cover were left on. The colonies put in this cellar nearly all died the winter after I left, while we had been wintering there with scarcely a loss for several years.

Another way was winter packing outside. We had 10-frame, two-story tenement hives, four colonies in each hive. That, of course, left only two outside walls for each colony. And then the colonies on the northeast corners would succumb to the cold some winters. But outdoor wintering in chaff hives or chaff packed winter cases is practiced successfully in many sections, especially in states just south of Minnesota and the Dakotas.

I have known men who brought their bees through in good condition by placing them in trenches. That is, digging long, narrow ditches in the ground and filling the bottom with straw or leaves and placing boards on that and setting the hives on the boards, after which straw is placed on the hives and the whole thing cased in with soil. I know nothing of that method from experience, as it never looked feasible.

Occasionally the chaff packed bees outside would get a flight duing a warm spell, but many were lost in the snow. Taken one year with another the bees wintered in the cellar and cave came out in spring just as strong as the ones outside, while the latter always consumed more honey.

The weather regulates as to the time bees are put in winter quarters. Any time from Nov. 10th on, if the fall weather is fine. They are taken out usually the first part of April, but sometimes the last of March if the weather is especially fine. I have seen the hives covered completely with snow as late as May and many times in April. As the sun is apt to come out bright and warm after one of those snowstorms, it is always best to take the snow out of the apiary, so the bees will not alight on it and get chilled.

We brought some of the out-apiaries home to winter, as we did not have wintering facilities at all the out-yards. In preparing for winter every colony was weighed and from 35 to 50 lbs. of honey allowed for wintering, according to the strength of the colony.

The best time to take bees from the cellar is about dusk, so they get accustomed to the outside air during the night and come out of their hives gradually as the morning advances. Many times I have asked neighbors all around us not to put out washings on the days the bees were set out, as they spot badly during their first flight. Honey invariably found its way to those homes later.

There is considerable cleaning up to be done in the spring when bees have wintered well; but when losses have been heavy and dysentery prevalent, I would almost rather do anything else than clean up such an apiary. The whole outfit gets into a very filthy condition, especially the combs.

In favorable seasons we had almost a continued honey flow from the time bees were set out in spring till frost. First came the soft maple and willows which were succeeded by fruit bloom and dandelions and by the time the main flow came, which is white clover, usually about the 10th of June, bees were in prime condition for storing honey, and swarming, too, for that matter.

Before the white clover was gone yellow sweet clover blossomed and shortly after that another main flow for those who live in the basswood section. White sweet clover comes along very soon after the basswood bloom and lasts till frost. There is also a variety of fall flowers, such as goldenrod, asters, Spanish needle, etc., from which an amber honey is produced.

When through with the last extracting we put our combs into hive bodies or extracting supers and tiered them up outside for the bees to clean off; after which they were stored in moth-proof boxes and left for Jack Frost to do his part. After passing through one winter combs will keep indefinitely, provided the receptacles in which they are placed are moth-proof.

FACTS ABOUT THE GREAT
OWENS RIVER VALLEY

In presenting to a California farmer, the many virtues of Owens Valley, my position is made awkward by the fact that I am in the real estate business, and that you, as a farmer, have read hundreds of advertisements of new lands, depicting the most remarkable conditions; probably have investigated several of them, only to find that the actual property being offered was far from what was described and the pictures used to interest you had been taken at some remote spot and had no bearing upon the property you were investigating. The result is that the more I say about the wonderful virtues of the Owens Valley, the more I am convicted of juggling with the truth.

Probably the most convincing argument I can use, is, of the many things I am about to tell you of the Valley, that if they are not true, word for word, I will pay your expenses for the trip, both ways, plus $5.00 per day for your time and, on top of that, buy you a new hat.

First, I will give you my opinion and observations of the Valley. I am a practical farmer, have raised deciduous fruit, alfalfa, corn, sugar beets, cauliflower, cabbages and potatoes on very large acreage. I am a student of farming, have studied soil conditions thoroughly, irrigation, fertilization and climatic conditions. I firmly believe that I am capable of passing an intelligent opinion on the virtues or shortcomings of any farming territory, which I have had the opportunity to investigate.

It is my firm conviction that the Owens Valley is so far ahead of any other farming community in California, that there is hardly a comparison to make. The only thing that I am at a loss to explain, is the direct reason for this condition. Whether it be the deep granite soil, or the abundance of pure, mountain water, or the total absence of fog, or the perpetual sunshine, or the high elevation, or whether it is a combination of all these conditions, I am at a loss to say. Nevertheless, the conditions are, that apples, pears, alfalfa, potatoes, corn, onions, and honey are produced in quantity and quality beyond belief. All these remarkable conditions are apparent to the observer, on top of the fact that there is no evidence of what you might call modern methods of farming. We know that the great corn belt of the Middle West has been brought up to a standard of from 70 to 90 bushels of corn to the acre, after years of educational work by the Department of Agriculture, Farmers Institute trains and state colleges; that seed has been distributed and lectures given, to improve the farmer in his raising of corn—and although not one of these advantages have been offered to the Owens Valley farmer, the corn they are producing today, both in quantity and quality, very nearly equals the best corn grown in America. I firmly expect to see 100 bushels of corn per acre taken from the Owens Valley in the next few years.

We know that in Greeley, Colorado, and in some European points, they have grown as high as 500 bushels of potatoes to the acre, with an average of about 330, but this has been accomplished only after the most scientific and modern methods of cultivation. Such methods are unheard of in the Owens Valley, but in spite of this, we find the same result in quantity—and the quality not to be excelled. I personally saw a potato field this summer, that when I looked at it, appeared to contain nothing but weeds, but when harvested, ran 330 bushels to the acre.

It was my good fortune to have with me, on one of my trips, an apple grower from the Rogue River Valley (Oregon), who had spent 23 years developing commercial orchards in that famous section. We were fortunate in being in the Valley at harvest time. He made the statement that he never saw finer apples in Oregon than were then on the trees—and that the remarkable thing was that the evidence of total lack of modern culture, both in the way of pruning, spraying and cultivating, was so marked, that should an Oregon orchard be left to get into such a condition, that the apples would be next to worthless. He surprised me by telling me that the Owens Valley possessed all the favorable conditions for raising apples that Oregon did, on top of the fact that the soil conditions were far superior.

Probably the one condition surrounding this remarkable territory which needs more publicity than any other, is telling the farmer of the true climatic conditions. There seems to be a prevailing opinion that the summers are very hot and the winters very cold. This is all wrong. The Owens Valley has, without doubt, (excepting the seacoast towns), the most ideal summer climate in all California. While there is sufficient warmth to assure a vigorous growth, they have no depressingly hot days—proven by the weather reports which are on file in this office and which will be forwarded to you upon application. Although they have an occasional snow in winter and, of course,more cold weather and frost than we have in Southern California, there is only a difference of about 10 degrees in the winter climate, and that, with the exception of last year, which was an unusual year throughout the entire country there is never a day that you cannot plow. It is a common remark among the farmers there that after 9 o'clock in the morning they work in their shirt sleeves the entire winter. They do acknowledge, however, that to get up early and feed the stock, one needs to be warmly clad.

It is my firm opinion that the resources of the Owens Valley have not been discovered. I have personally found celery that was as fine as any I ever saw. I have heard of the remarkable qualities of fancy table grapes, currants, gooseberries and cherries, that were as superior as anything grown in America. It is my firm belief that within the next five years, Owens Valley will be known as the garden spot of California and the lands with good water rights will be commanding the highest prices of any agricultural lands in this state.

I believe that you will agree with me that the time must come when we will arrive at the value of farm lands as we would a piece of close-in business property in a large city, namely, that its value is contingent upon its earning ability, and that land that will grow 400 bushels of potatoes to the acre, should be worth four times as much as land that will grow 100 bushels, for we know the same amount of labor is expended upon both.

You, who have raised citrus fruits and have paid your good, hard cash for commercial fertilizer, know exactly the value of lands that are rich in phosphoric acid, nitrogen and potash.

Although our regular terms are ¼ cash, balance in three equal annual installments, less than one-half of our sales have been made according to these terms—and to the good, serious, honest, thrifty farmer, who wants to get on to our property and develop his little piece of land, we are always ready to co-operate with him, in modifying our terms to permit him to accomplish his object. We, however, will not encourage any man whom we feel is not able to make a success. I firmly believe that the man who has enough money to get established on the land, that his crops will produce each year, many times the amount of money he may owe on his property. Of course, we cannot guarantee this, as there are some men who could not make a living on 1,000 acres.

If you have any idea of making a change—and what I have said interests you sufficiently to feel that you would like to live in the Owens Valley, I want you to cut out the attached coupon and mail it today. I will send you a complete assortment of pictures, descriptions and maps, that will tell the story as vividly as I am able to express it.

I realize that the best way of carrying the good news to the farmers of California, is through a personal interview, by a thorough farmer who has seen and knows the Valley. I am looking for good representatives in every community. I do not want the regular stem-winder real estate man. I would rather have a thorough farmer.

JAMES R. H. WAGNER.

Irrigation and Forestry

A PRACTICAL EXPERIMENT.

When the Country Life Commission of the state of Washington, appointed recently by Governor Marion E. Hay, meets in Spokane the week of November 14, plans will be presented for a model community center and consolidated country school, to be established in one of the rural districts adjoining Spokane, early in 1911.

David Brown of Spokane, chairman of the commission, announces that Governor Hay and possibly Colonel Theodore Roosevelt will attend the conference and assist in formulating a practical plan for the betterment of life on the farm, along the lines suggested in the report of the Roosevelt Commission on Country Life, which, headed by Professor Liberty Hyde Bailey of Ithaca, N. Y., made a tour of the larger farming districts of the United States the latter part of 1908 and early in 1909.

This is to be the preliminary step of a nation-wide movement, co-operative with the various states and territories, in an endeavor to teach the youth of the land the fundamental principles of agricultural and domestic economy and manual and industrial training, also giving the farmers in the communities the benefit of the most approved methods of agriculture and allied subjects. The community center is designed to furnish a place where men and women can meet for the interchange of ideas.

Primarily, the school is for the average boy and girl, whose institutional education ends even before they finish the secondary school, the purpose being to train them to become useful men and women and capable of supporting themselves, and thus adding to the wealth production of the country at large and the districts in which they live and to better their condition of life.

The Washington commission has prepared tentative plans for a community center, including a consolidated rural school. It is designed to cover 10 acres and will serve a school area of 36 square miles, the most distant point being three miles. In addition to the school building the plans show a large community hall, residence for the principal and supervisor, athletic and play-grounds, tennis court, pressure water tanks for domestic, lawn, irrigation, stock and fire uses and plots for the practice of agriculture, horticulture, floriculture and forestry. Surrounding and bisecting the tracts will be models of good road building.

The school and other buildings will be under the direction of a principal, trained in the various branches of agriculture and familiar with conditions in the Northwest. This official will be assisted by a supervisor and a corps of teachers. In connection with the community hall will be a bureau of information, containing all the available data of federal and state departments of agriculture and experimental stations in the country, also books and journals dealing with all the branches of the industry.

The community center is to be made beautiful with trees, shrubs, flowers and lawns without being ornate, and no saloon, store or other commercial institution can be located within half a mile of its boundaries. The teachers will be men and women with red blood in their veins and able to adapt themselves to the ideals of the center and school of the type outlined. Among other qualifications they much be broadminded and optimistic and able to see the human side of life, also be helpful to those under their charge.

The keynote is that the best defense against misfortune is to give every child in the country such education as will enable it to make its own living on a piece of land, if necessary, when it becomes of age. It is purposed to launch a campaign, urging the people of the open country to work together, not merely with the view to forwarding their own economic interests or in competing with those who are organized, but to develop themselves and establish an effective community spirit.

The consolidated rural school will be similar to the graded city institution, the betterment of the curriculum being by emphasizing industrial and manual training and domestic science and adding such other studies as will give the students a knowledge of things with which they come into contact in actual life and presenting means of working out the chief studies in practice. It is also purposed to teach the students the principles of business. However, the value of agriculture as the greatest of all industries will be constantly kept to the fore.

"This may be termed a 'back to the farm' movement, the necessity of which is becoming more apparent every day," said Mr. Brown. "We need more men and women on the farms; in fact, it would be better for the nation's prosperity if 65 per cent, instead of 33 per cent of the population, as at present, were tilling the soil, milking cows and setting hens. The open country, however, is not the solution of the out-of-work problem, for, unless instructed in some branch of agriculture and keenly interested in the work, the average man is worse off in the country than in the thronged city.

"This takes the Spokane plan to the first principle, that the child should be educated along practical lines, and to bring this about the country school much be made a new kind of institution. The rural schools are held by some to be largely responsible for ineffective farming, the general lack of ideals and the rapid drifting from the country to city. The rural schools are not declining; they are simply in a state of arrested development and have not kept pace with the changed conditions of life.

"We believe the movement will meet with favor not only in the rural districts but also in the cities, as every citizen must be interested in the enlargement of the country's agricultural resources and maintaining the nation's growth. This means the full development of the farm as expressive of all the social and economic forces that make for the welfare of the farmer, the real backbone of the nation, and those in other lines of endeavor who are dependent upon his successes."

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

No Indication of Tuberculosis.

Please tell me is it a fact that three teats on a cow is a sure indication of tuberculosis?—Subscriber, Imperial.

We never heard of any such claim and fail to see where it could be the faintest indication of such disease. We have heard of excellent cows which were so afflicted and lived to old age and were good producers.

Pasture.

I have recently bought small ranch having alfalfa lot used as pasture. Can be irrigated from flowing wells. Pasture has been over-stocked and needs plowing. Will rye make good pasture?—Subscriber, San Bernardino.

It is always a little hard to advise any one from merely hearing their plans. I have no doubt you are studying and planning out the best way possible. Wheat, barley and rye are all in use here for a fresh quick bit for the cows. If they are all planted at the same time the rye will come first then the barley and then the wheat. In speaking of the pastures being plowed up, I wonder what is being sowed on them? Here in the San Joaquin we would sow them with barley, first plowing the land ten inches deep, then harrowing well and then drilling in the barley, then on top of that we would put alfalfa seed on covering it lightly. Eighty pounds of barley and ten of alfalfa will give a heavy crop of barley hay and a thick stand of alfalfa. The land that alfalfa is on is land that can be irrigated during the summer time. The alfalfa seeding may be considered too light but it is not if the land is well cultivated and the seed not buried by covering too deep. When rye and barley is to be pastured, it had best be sown alone for the tramping is bad for the young alfalfa plants and then too the cattle will pull it up as they will graze it off before they touch the barley or rye. The neighbors will be glad to advise about the customs of the country and it is safe to follow these for most of the land. Then try out new or personal ideas on a small scale to demonstrate their utility without being a financial drain if not successful.—M. E. S.

Mealy Bug.

I send lemons infested with scale. What is it and what is the proper remedy? Resin wash does not kill them.—Subscriber, Pacific Beach.

We regret very much to inform our subscriber that he has a bad infestation of mealy bug, one of the worst pests of citrus orchards. Next week's Cultivator will have an article by Horticultural Commissioner Essig of Ventura county on this pest. He has tried a great number of treatments, securing best results with fumigation, but at a prohibitive price as continuous treatment is necessary costing two or three dollars a tree or even more. This compelled him to turn to sprays and he has found that the carbolic acid emulsion gives the best results. The treatment will be given with details of mixing and applying.

Guinea Eggs.

Where can I secure guinea eggs for hatching; also Indian Runner Ducks, either gray or white?—Mrs. E. D. Starks, Imperial.

We give the subscriber's name in full and any who can supply her should send particulars. Further, we may add that we have constant inquiry at this office as to where guinea eggs may be secured and this indicates a good line of advertising for those who have them.

Cypress Hedge.

I have cypress hedge which is gradually dying out. It is not from lack of water as irrigating ditch passes trees. Is it because of too much water? How often should hedge be trimmed? How often should it be irrigated where ditch does not supply almost continual water?—W., Los Angeles.

We presume our subscriber means the Monterey cypress. It is a forest tree and while it will stand severe pruning for a few years, ultimately it rebels and dies out in spots. We have seen it grown where it had almost no water and where it had continuous water, and the dying out has been invariable. In fact, the tree when allowed to grow to its natural height—and it is a tall tree—is not particularly long lived. When young and vigorous it is one of our handsomest hedge plants, but we do not think there is any possibility of saving a hedge which is beginning to die.

Tapping Water Pipe.

A has a water pipe line (private) which crosses B's land, the same laid when B's land was a government claim. Has B the right to tap this pipe for domestic purposes, and if so, how much or what proportion can he take?—A. B. C.

B has no right to tap A's pipe line. —E. L. P.

Fencing Highway.

Please let me know through your paper if all or a portion of a sidewalk on a country road can be fenced in and used. The sidewalk never has been used as such, but farmed by adjoining property owner. —J. H., Sespe.

No part of the highway should be fenced. If your property line is outside of the sidewalk and the public has not acquired an easement by reason of long and continuous use, you might fence.—E. L. P.

Moving Irrigating Ditch.

Can I be compelled to move irrigating ditch which has been in use over five years? Ditch was constructed along high line side of my holdings according to Imperial Land Company's survey which is the basis upon which practically all our claims are adjusted. The government now moves our line 12 rods.—J. W., Brawley.

The inquirer does not state whether the irrigating ditch is left on his premises, or by the change is left on some one's else property, but I cannot conceive of any combination of circumstances short of an understanding with the party upon whose land the ditch is, which would compel the removal of the ditch. It might be that the inquirer would be obliged to make a new ditch in order

to obtain water if the old ditch is now on some one's else land and that party refuses to permit access to it. The solution of that question, however, would depend upon many facts which are not stated by the questioner.—E. L. P.

Use Teat Plug.

My cow has sore on end of one teat, extending up into it a little way. There is also small lump in same section of udder. I have to open teat with quill night and morning and then can hardly milk.—R. J. R., Lindsay.

I would insert a greased wooden plug into this teat. You can cut one with a knife and make it very smooth and blunt, about the same size all the way and at the end make a head with a rim around which a piece of cloth can be used as a string to hold it in place. Now if you will take half a clothes pin for this stick to cut you will find it easy to make. Grease the plug well with vaseline and then bathe the sore with warm water, soaking off the scabs, and grease it well with vaseline. Insert the plug and use a strip of cheese cloth about an inch wide to tie to it. Tie it in the middle of the strip of cheese cloth. Insert the plug which is long enough only to reach past the sore spot. Then bind the pieces of cheese cloth around the teat, covering it completely, and tie the ends in a neat bow knot. Each day before milking wash the teat in hot water and again after milking before putting in the plug. After the actual soreness passes, dry it up with subnitrate of bismuth powdered on it. A milking tube should be used for milking this teat in order that as little pressure as possible is put on the tender spot. The lump in the udder I think you will find has been caused by not getting all the milk away from this quarter. I would gently work this with my hands until I could reduce, using hot water over it and then using vaseline until it was gone. The use of a milking tube will help this probably in that it will remove the milk clean. Sometimes it is necessary to paint these lumps for three days with iodine and then leave for three days and repeat if not entirely absorbed in that time.

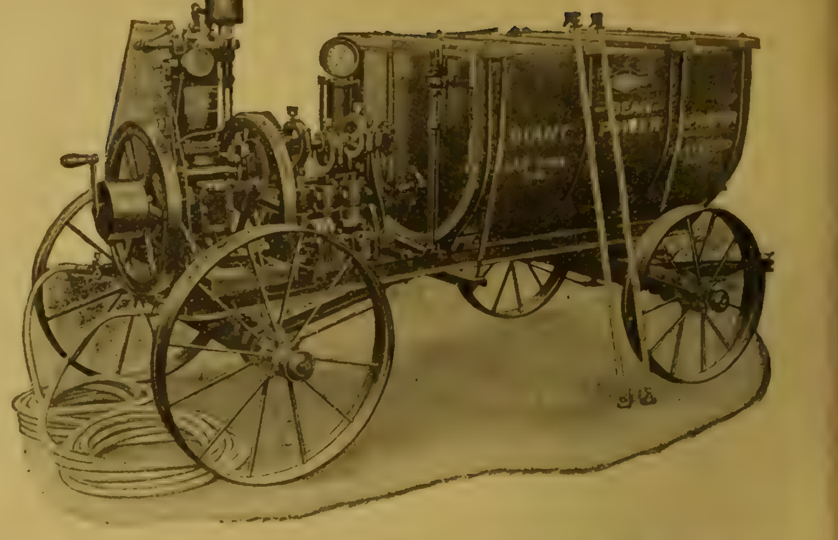
If you cannot secure a milking tube, by sending a dollar to O. J. Weber Co., Los Angeles, they will mail you one. They also will send you a lead teat plug that is useful to have in these cases. You will find their advertisement in the Cultivator.—M. E. S.

To Remove Wart.

Is there any remedy for wart or large soft growth on cow's teat? I have a cow with such a growth, and it hinders correct milking.—Subscriber.

Wash the teats clean and then use castor oil on the wart each time after milking. This seems the simplest way to remove warts from any tender tissue. Butter of antimony is sometimes used but it is poisonous and if the cow licks it or a calf sucks at the teats it may do mischief to the digestion of the animal.—M. E. S.

Wool growers of the Northwest will mke a strong fight at the Wool Growers' Convention which will meet in Portland in January to secure less stringent regulations in forest reserve pasturing.



BEAN POWER SPRAYERS

ABSOLUTELY RELIABLE

You can depend upon a Bean sprayer. Whenever you're ready, it's ready. Every Bean outfit is carefully tested before it leaves the factory and **Every Bean Sprayer is Guaranteed to Operate Perfectly After It Leaves the Factory.**

Built low down and built for short turns. An ordinary team can haul a Bean outfit anywhere under any conditions. And they're as light as a GOOD power outfit can be made. Soft soil does not bother the owner of a Bean.

All our outfits have Bean Patent Bell Metal Ball Valves. They can't clog or corrode and can be reached in half a minute.

All Bean parts are readily accessible and ALL ARE **Interchangeable.** When parts wear out they can be renewed at small cost. Any orchardist can make his own replacements.

Send for our New 1911 Catalog.

ADDRESS ____________________

SONOMA COUNTY FROM A BIKE.

By Nat. E. Luce.

Yes, Sonoma is a county to be reckoned with. She is great agriculturally. Her agricultural lands lie in the western part of the county from Petaluma and Sonoma on the south to Cloverdale on the north. Of course Petaluma is known the country over as the greatest poultry center in the world and after one has been through the district, he can well believe without a doubt that it is what is claimed—the largest any where. They not only raise hundreds on individual ranches but thousands. Large numbers of ranches run from two to four thousand head. Then there are many hatcheries that hatch baby chicks by the thousands. The poultry raisers there do not pursue haphazard methods but go at it in a scientific and business like way, thereby making a complete success.

East of Petaluma about fourteen miles is the Sonoma Valley running from Schellville through Sonoma and around to Santa Rosa. This little valley of Sonoma is rich though small, with wonderful vineyards and splendid orchards and now they are finding that English walnuts do splendidly there, the bottom lands are warm and rich and produce everything in abundance without irrigation. Have seen and eaten grand melons there and corn does well on the bottom lands. North of Petaluma is Santa Rosa the county seat of Sonoma county. Round about Santa Rosa is a large area of splendid farming land. Here is the home of Luther Burbank.

Santa Rosa's products are largely diversified as shown by hops, grain, dairying grape growing and deciduous fruits. All have their places on the ranches and many small ranches are now being taken up and small fruits and poultry are the main item on these places.

West of Santa Rosa six miles lies the well known town of Sebastopol famous for its wonderful apple district. This apple belt lies on what is known as the Gold Ridge. The soil and climate about this district seems to be especially adapted to the growing of the very finest quality of apples as can be attested by their record at the Watsonville apple show. The soil is a sandy loam. The trees look vigorous, clean and healthy. It is also a great berry grower. Hundreds of acres are devoted to this industry, with large flocks of poultry on nearly every ranch.

One criticism I wish to make about the Petaluma and Sebastopol districts, they tolerate poor roads. If they could only get the inspiration of the gospel of good roads, good and hard, it certainly would appeal to the stranger coming into those sections. To my knowledge four good sales were lost in these sections lately because of poor roads. It most certainly behooves the citizens to get busy and do something toward bringing about a general movement for better roadways.

North of Santa Rosa is the Healdsburg district, about which lies some of the finest lands one could wish. The Russian river section south of Healdsburg to Forestville is also a most productive territory, with beautiful ranches under a high state of cultivation.

Corn, yes corn! I saw a six acre field on the Darby ranch about three and a half miles south of Healdsburg that would average at least ten feet in height. I walked through trying to realize that I was in California instead of back in the corn belt of the middle west. Ears of corn 18, 20 and 22 inches round were the rule. While not as long ears as one would see back east they would rank as extra good anywhere.

Many splendid hop yards and beautiful prune orchards are seen on every hand and large dairy herds of blooded cows were also in evidence. The lands are a dark, rich loam, easily worked and wonderfully productive.

The Dry Creek Valley to the northwest is another splendid body of land, and as one rancher put it, its only fault is there is not enough of it. Good roads prevail. One early morning I came to a place where I had to dismount and walk around a new concrete bridge which was under construction. It is under the supervision of road superintendent H. A. Hall, for that district. He said that the people in that valley were awakening to the fact that good roads and good bridges are a valuable asset to any community and that they were trying to keep up the crusade for not only good roads but the best they could make.

Take the Healdsburg district as far north as Geyserville and the Alexander Valley, the writer does not believe there is a richer section of farming land anywhere. This district produces exceptionally fine prunes. Good roads are the rule in the north part of the county and it was a pleasure to travel through it and visit the ranchers of a section where they are awake to their own interests.

On the Rasor ranch at Geyserville I saw dried peaches that would be classed as extra fancy in any market. As might be imagined very few ranches are for sale and those at good stiff prices. Many of these ranches have turned off two to four hundred dollars per acre this season, and one man said he had offered his ranch at a price on which he had received twenty per cent.

From Geyserville to Cloverdale is the great Italian-Swiss vineyard colony section where thousands of acres of rolling foothill land is given to the growing of wine grapes. Cloverdale is the live little town at the extreme north of the valley and in a sheltered, fertile spot. Here oranges are grown and the enterprising ranchers have built a large building of concrete in which a citrus fair is held each season in February. I saw many fine groves ranging from one to ten acres. Trees are healthy and practically free from scale, with their loads of fine fruits turning to gold.

All in all Sonoma is a great county. A few figures may help one to realize something of its magnitude. Poultry and eggs has two millions of dollars to its credit; butter and cheese nearly three quarters of a million dollars, wine two and a half million dollars, hops three-quarters of a million berries seventy-five thousand dollars, fruits three-quarters of a million.

Great is Sonoma.

WORK FOR THE GRANGE.

The grange can force the battle for the farmer. It must meet the conditions that arise, with intelligence and strength. Better financial conditions for the farmer mean better homes, happier families and a greater love of the farm. By reason of its strength the grange has added responsibilities which it must assume and carry through to success. It has an opportunity no other organization ever had to build for the future. The great agricultural interests look to the grange to represent them in the legislature, before congress and in the executive mansion .

The grange has an equal duty to perform in the town, in safe-guarding the farmers' interests there. The business side of the grange is assuming important proportions. The grange is not only a social and literary club, it also reaches out and is intimately connected with the business interests of the farmer. It stands for education of the young—whether of the farm or other calling. —Santa Rosa Republican.

This season's Arizona oranges and dates have sold at fancy prices in Chicago.

The University of Idaho at Moscow has adopted the "Wisconsin idea" and will conduct movable schools of agriculture.

Utah claims that with her magnificent grazing possibilities she is the peer of any state for dairying.

Utah dry farmers report ideal fall conditions.

ALFALFA ON THE DRY RANCH.

The art of raising alfalfa without irrigation is to accumulate sufficient moisture in the subsoil and then get the roots down into it. Two to three feet of moisture will carry the alfalfa a whole year and insure a stand whether it rains or not. By plowing in the fall 10 inches deep we can usually conserve this amount of moisture by springtime. But for those who plow only six or seven inches deep it is better to fallow the land a whole year.

Dry year plowing in the fall is not detrimental, provided the ground is not planted until spring. The tilth of the soil at time of plowing matters nothing, but at time of planting it matters everything.

The best time to plant is usually about the 20th of April. Late planting is dangerous for all small seeds which have to be planted near the surface, for in hot weather the top inch or two dies out very quickly, and if the seeds sprout and the next rain is too long in coming the whole stand may die out before the rootlets can reach the wet dirt down below.

It can be seeded broadcast by hand or drilled, but the solid wheel drill is not as good for the purpose as the split wheel, which I am glad to see they are commencing to manufacture for all purposes. The split wheel leaves an unpacked streak in the seed row for the young sprouts to come through and obviates the necessity of forcing their way through a crust, which is a great advantage when the rains are few and far between. Ten pounds to the acre is a good amount to plant.

In 1908 we had two feet four inches of moist soil to start with. We plant-April 15th; a soft snow May 4 brought it up, a light rain May 15th helped it along, then it turned dry and did not rain again until July 29, a total of 10 weeks' douth. The alfalfa grew about six inches high, and we had a fine stand. We cut, weeds and all, in August, leaving it on the ground.

Alfalfa can be planted in rows and cultivated as often as necessary, but when planted in the ordinary way it can be cultivated four times in the season, which is as often as the general run of farmers will cultivate anything. The first year it can be lightly harrowed in the fall or if not very large it can be left alone, for if it lives until August it will hold its own anyway. The next spring it can be harrowed, before sprouting and after each cutting. After the second year the disk may be used, cutting deep or shallow, according to the size of the plants.

Farmers sometimes complain that
r a year or two their alfalfa dies
There are two reasons for this.
s shallow soil with a poor sub-
he other is not conserving

e is
re-
re
into it. The alfalfa is living from hand to mouth and the first dry winter knocks it out.

It is the same with any crop. The normal length of the roots of small grain, for instance, is somewhere about four feet, but if a man who never conserves moisture plows only six inches, his subsoil is bound to be dry, the roots do not go into it and he is trying to grow a four-foot root in a six-inch space.—Dry Farming Congress Bulletin.

TO KILL OR PREVENT WEEVILS IN CORN AND PEAS.

While we have printed this remedy several times, we must print it again, for we are almost daily getting letters asking for the recipe. The best method known is to use carbon bisulphide. This is a liquid but is sold by the liquid pound. One pound is sufficient for 75 bushels of corn. You must have an air-tight crib or bin, else you must have a large cloth sheet sufficient to cover the pile of corn to be treated. The carbon bisulphide is placed on top of the pile of corn in an open vessel. It is very volatile, and the fumes flowing from it as it evaporates are heavier than the air and poisonous to the weevil. These fumes will settle down through the corn and kill the weevil. After the carbon bisulphide has evaporated, you lift your sheet or open your tight crib or bin, and the air soon dispels all fumes,, your weevils are all dead and your corn perfectly healthy to feed or eat. The exposure to the air will remove all danger in feeding. This has been tried and is a sure and safe remedy.

Care must be taken not to bring a lighted lantern or match about the fumes for the first day or so, as they are explosive.—Southern Cultivator.

A CURE FOR ALKALI.

Almost all soil contains more or less alkali. Whenever the soil strata is such that there is no natural drainage, and water is applied to the surface it generally collects in the basin, the surface of the underground water gradually rises, and when it gets near the surface, excessive evaporation occurs and as the moisture passes away as pure water the salts contained in the water are left at the surface of the ground. In due time the soil takes on a white appearance and vegetation suffers.

Naturally, the cure for this condition is to lower the water table, and if there is no natural drainage, this must be done by artificial drainage. Anything that will provide a channel through which the underground water may get away will answer the purpose.

In many cases tile have proved to be unsatisfactory. Both cement tile and some burned clay tile have shown the effect of alkali, and there are instances where each has disintegrated and gone to pieces in a few years.

The open-bottomed wooden box seems to last as well as anything, and there are instances where these have been in service for eighteen years and the wood is still sound. Wood kept absolutely dry will last indefinitely, and wood kept soaked will also last indefinitely. There are instances where piles have been driven and kept continually covered with water. After centuries of time these piles have been removed and found to be as sound as they were the day they were driven.

A wooden pipe or box used for a drain is surrounded by moist earth and water continually runs through it, so it is saturated, and therefore has a long life under these conditions.

Get a good engineer to plan and lay out your drain for you and it is necessary for him to make an examination of the subsurface soil as well as of the surface soil in order to intelligently place the drain.

This is a common statement: "My ground will not drain, for I have tried it." If an investigation is made, however, nine times out of ten it will be found that the drain is an open drain, the banks have caved and choked the channel, the weeds have been allowed to grown in it. Of course, it won't work under these conditions.

Wooden boxes are easier to lay and lay properly than tile, for the sections are longer and there is less danger of tilting and choking the channel. Remember, however, that in all cases careful work must be done if the drain is to be a success. It is not an exaggeration to say that all land can be drained if the system is properly planned and the work properly done, and this is the permanent cure for alkali.—Journal of Agriculture.

TAKING CARE OF THE ALFALFA.

Alfalfa is essentially a deep-rooted plant and produces the maximum yield only when the roots can be maintained in healthy condition to the depth of at least four or five feet in a fertile, well-drained soil. In a few localities here in the west our soils are relatively shallow, being underlaid at from 18 inches to two and one-half feet by gypsum or rock. At present it does not appear that this class of land can be expected to yield the maximum in hay, although the average yield seems to be as good if not better on this class of land. However, plant life is full of surprises to us and alfalfa is a remarkably adaptable plant. In the past few years a number of our farmers have realized the importance of available fertilizers to increase their alfalfa yields and in a few instances the value of either top dressing or plowing under barnyard manure has been proved beyond question by bountiful increase in the yield.

One example with which I am personally familiar will suffice to show the value of manuring. Early in October, 1907, we prepared five acres of raw land. After clearing, plowing and leveling we irrigated and spread 100 loads of barnyard manure. This was turned under at once, a fine seed bed prepared and 12 pounds of seed to the acre was sown with a press drill. A hard rain followed quickly and so packed the ground that a poor stand resulted. As soon as dry enough we harrowed and sowed more seed broadcast. We were preparing to irrigate when another rain storm saved the trouble of irrigating. A first-class stand of alfalfa resulted. During the following season we cut three times after an early clipping and we cut 4.2 tons of hay from each acre which was baled in the field and weighed immediately. In the fall we plowed up half of this alfalfa to plant to grain and other annual crops as an experiment on fertilized ground. I will say in passing that oats and wheat raised on this land proved the only good grain crops we had on the place.

During last season we cut the remaining two and a half acres of alfalfa five times, the total weight of stackable hay amounting to a little over 17 tons. Alfalfa hay in the stack shrinks 25 per cent in 60 days, after which time there is no appreciable loss. Taking account of the loss this alfalfa patch yielded 5¼ tons of hay to the acre, which could be sold in the winter when the maximum price prevails. During the first season it was attacked to a very limited extent by root fungus. It was irrigated usually in the day time when there is the greatest danger from scalding and thus weakening the plant when it becomes an easy victim to the fungus.

Let us take care of the alfalfa field. We must not lose sight of the very apparent fact that it is much more profitable to grow 50 to 60 tons on 10 acres of land than it is to grow 40 tons on 20 acres. In shipping alfalfa in the bale we cannot afford to permanently rob the land of that which we have taken away. I hope it can be conclusively demonstrated in a few years that we can double our alfalfa yields by applying highly available commercial fertilizers. Let 10 men this season buy 500 pounds of high-grade phosphorous fertilizer, incorporate it with their soil and at the end of the season figure up and compare results. We can further increase yields by cutting and by irrigating at the right time. Alfalfa hay is the richest food when cut early in the blooming period. Do not wait until it is in full bloom. Alfalfa cut early starts its new growth quicker, especially if the ground is wet. Irrigate just before cutting or as soon after as posible. In other words, do not allow the plants to stop growing. One thing is quite certain: A lot of farmers are not getting the full profit from alfalfa. —L. E. Foster in Field and Farm.

CARE OF FARM IMPLEMENTS.

One of the most serious leaks on the farm is in the poor care taken of farm implements when not in use. As soon as the season is over, binders and other machinery, no longer needed this year, should be carefully cleaner; the grease and dirt should be removed from the bearings, and these should be carefully oiled and all bright parts greased, to prevent rusting. Preparations should be made for replacing any broken or defective parts.

If time does not permit of all this, make a memorandum to be governed by on some stormy day, and then see that everything is put in readiness for the next harvesting or haying season. Get the repairs and place them on the machines at once. Take care of the plows. Get them under cover. Clean and grease the bright parts, so that, when wanted next spring, they will scour and save the time so many farmers lose in putting their implements into working order. —Minnesota Ex. Sta. News.

The most practical way to handle dodder is to avoid buying clover or alfalfa seed which contains it. Dodder seed is of a dirty brown or gray color, with a spherical shape and a roughened surface. It is slightly smaller than clover or alfalfa seed.

Money Making Little Liners

In this department we will insert your advertisement under a classified head for 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for our many thousand readers.

LIVE STOCK.

For Sale—Registered Holstein Bulls; 1 to 2 years old. Some sired by Prince Juliana, brother of former world's record heifer, Juliana De Kol. Dam and granddam, A. R. O. cows. Three record-breakers in some of their pedigrees. M. E. Sherman, Minnewawa Vineyard, Fresno, Calif.

Buy Does Bred to "Andreas Hofer" due February, March. Black Tog. Saanen grade, hornless, wattled, $30; Red doe, fine dairy type, beautiful hare-like ears, $20; and others. R. M. Cartwright, 1353 Palm St., San Luis Obispo, Cal.

Fistula, Poll Evil, Quittor and all running sores cured permanently by a recent discovery of medical science. Write for particulars. Dr. Fred G. Matthews, Veterinary Bacteriologist, 1232 Central Ave., Los Angeles.

Jersey Bull For Sale—Golden Lad Strain. Dam has authenticated butter record. G. B. Reeves, Mountain View, Cal.

A few young White Hornless Swiss Saanen Grade Milch Goats for sale. Mrs. E. Banta, Calistoga, Cal.

Registered Shorthorn Bulls and Poland China Hogs for sale. Best breeding. P. H. Murphy, Perkins, Cal.

MISCELLANEOUS.

A Bargain—To be disposed of at a sacrifice, well established grain, hay and feed business with a trade of $3000 a month. By right party trade can be doubled. Low rent. Ill health the cause of selling. Call or address A. B. Smith, Bodega Ave., Petaluma, Cal.

Raisins—Producer to consumer, new crop loose Muscatels in 50-lb. boxes, 2 crown, 4c; 3 crown, 4½c; 4 crown, 5c; seedless, 4c. guaranteed. A. H. Dugdale, Etiwanda, Cal.

Income city property from $50 to $500 per month for ranch or acreage, equal value. Submit details, description. Parrish Barker, 207 Union Trust Bldg., Los Angeles, Cal.

For Sale—Female Scotch Collie pups; pedigreed stock. Descendants of Wellsbourne Conqueror and Anfield Model. A. C. Wisegarver, San Fernando, Cal.

WANTED.

Wanted—Your work pays the expense to learn a trade that pays $5 a day, in a few months' time; electricity, automobiles, plumbing, bricklaying; actual contract jobs; 200 students last year. United Trade School Contracting Company, 647 Pacific Electric Bldg., Los Angeles, Cal.

Help Wanted—We want several good solicitors to solicit for a high class suburban monthly publication. Good profitable employment to the right party. For particulars address Box H, Cultivator Office, Los Angeles.

Wanted—To purchase windmill or small engine and tank, also irrigating pipe. Rogers, 120 Winston street, Los Angeles.

TREES.

If You Have No. 1 Deciduous Fruit Trees, berry vines, or citrus trees, true to name and first-class, we will buy for cash or exchange for No. 1 ornamental stock; have a surplus of Acacias, Pittisporums, Date Palms, Guavas, Camphors, Monterey Pines, Cedar Deodoras, Cornichon Grape Cuttings, Spineless Cactus (Mission). Good Columbus Surrey, fine 20th Century Carbide Gas plant. Get busy. Address H. L. Bauer & Son, 737 S. Spring St., Los Angeles.

Ornamental Eucalyptus—Cleanest and best shade trees for the ranch. Acacias, pines, etc. Large stock. Ballou's Nursery, 728 East Orange Grove Ave., Pasadena, Cal.

Write for Special Price on peach trees and French prune trees, on Myrobolan root. Gridley Colony Nursery, Gridley, Cal.

Marsh Seedless Grapefruit—600 large trees for sale. E. S. Thacher, Nordhoff, Cal.

Black Walnut Selected Trees—One and two years old, 2 to 8 feet high. Also seedling peach trees, good stock, and Maliner Keen Horseradish sets. A. P. Henning, Clements, San Joaquin Co., Cal.

For First-Class Valencia and Navel Orange trees and Eureka lemons, see A. G. Snow, Oxnard, Cal.

Fine Line of Navels—Valencias and Eureka lemons for delivery spring of 1911. Contract now and get the first choice. The King Citrus Nurseries, Whittier, Cal.

NURSERY STOCK.

Having bought our seed of Luther Burbank, who guaranteed it selected seed, mostly from Giant Crimson Winter Rhubarb, we feel in shape to offer choice Crimson Winter Rhubarb plants for this year's planting at reasonable figures. Write for particulars. B. B. Currier, Sea Bright, Cal.

Rivera Nursery, L. L. Bequette, Prop.—Wholesale and retail dealers in Northern and semi-tropical trees, shrubs, roses, green house plants, etc. Have good stock of apples, peaches, etc. Send for descriptive price list. 625 S. Breed St., Los Angeles, Cal.

Our Descriptive Price List No. 2 contains all novelties exhibited at the Pasadena Flower Show, also other new introductions by Dr. Franceschi; mailed free on application. Montarioso Nursery, Box 1500, Santa Barbara, Cal.

Improved Superlative Red Raspberry Plants—Largest raspberry in cultivation. 100 plants, $5.00. Send for description. William Richard, 438 River St., Santa Cruz, Cal.

RARE PLANTS.

Wild Plant Improvement Gardens, Santa Ana, California. Newton B. Pierce, proprietor. Rare choice ornamentals and new fruits from all lands.

For Sale—Fine stock plants of Yellow Major Bonnaffon Chrysanthemums at 50c per dozen, $3 per 100. Also other varieties. Langley J. Goodman, R. F. D. No. 1, Box 22, Los Angeles, Cal.

Ahuacates, Alligator Pears (Persea Gratissima). Fresh Mexican seeds, none better for stock; $4.50 per 100 seeds; $40.00 per 1000 seeds. Montarioso Nursery, Box 1500, Santa Barbara, Cal.

FARM LANDS FOR SALE.

For Sale—San Joaquin Valley—80 acres rich land with heavy stand of alfalfa, 3½ miles from railroad and growing town, money making dairies adjoining. In natural gas and artesian belt. An excellent opportunity for dairy, hog raising, chickens and turkeys. If necessary, local bank or creamery will furnish money for cows to put onto this piece. Price of $135 per acre includes interest in 4 flowing artesian wells, furnishing plenty of water for irrigation. Terms, one-third cash, balance term of years at 6 per cent. Address S. W. McKee, 2120 West 31st street, Los Angeles. Home phone 71248.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

For Sale—155½-acre ranch in Owens Valley. 120 acres in cultivation, balance good pasture, 12 acres in 2-year-old Winesap apples. Work stock, farm implements, milk cows and 100 head hogs. Ranch 2½ miles from county seat. Mountain water, continuous flow, no assessments. A good opening for dairy or creamery. Address owner, Box 52, Independence, Inyo County, Cal.

For Sale—815 acres in San Luis Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. Forty acres of land suitable for these. Price $21 per acre. For further particulars apply to Mrs. F. A. Clink, Pozo, Cal.

For Sale—5-acre chicken ranch, ¼ mile from Petaluma, 5-room house, brooder house, windmill and tank, all new. Fine well of water, also fine view of surrounding country. Cow, horse, wagon, and 900 laying hens go with place. Net income last year over $1,000. Price $4,500, if taken before the first of January. Call or address A. B. Smith, Bodega Ave., Petaluma, Cal.

Tulare Co.—$35.00 per acre for short time. 80 acres level alfalfa land, 4½ miles from town and railroad. Unlimited pumping water at 14 ft. Electric power available. Terms, ½ cash, balance 1, 2, and 3 years at 7 per cent. Adjoining land improved. C. H. Biggin, Pixley, Tulare Co., Cal.

For Sale—A relinquishment for $500 to 160 acres of the finest level land in Fresno County. This land is without spot or blemish, surveyed, cleared and a small shack. Adjoining deeded lands worth $30 per acre. Your chance this week only. J. E. Farnham, Hollywood, Cal.

For Sale—Eighty acres finest Eucalyptus land, 4 miles from Santa Maria, Santa Barbara County, 1½ miles from railroad station, $30 per acre. Apply to A. Frederiksen, Arroyo Grande, Cal.

For Sale—An ideal poultry ranch and mountain home, 33 acres, 3 miles from Aptos and seashore. Fine fruit land; family orchard, splendid timber grove, accommodations for 1000 chickens; best water and climate; school close by. L. Pedersen, Aptos, Cal.

Irrigated Land—The famous Gridley Colonies. Improved lands, best homeseekers' proposition in California. Write for particulars. Gridley Land Co., Gridley, Cal.

For Sale—El Cajon Grant Land. Virgin soil, 4 miles to railroad, good farm land at $30 to $60 per acre. S. B. Hawley, 1548 D St., San Diego, Cal.

The Best Buys in farm lands in Central California can be had through us. Call or write Sterling Securities Co., Savings & Loan Bldg., Stockton, Cal.

For Sale—In Sutter County, California, choice fruit and alfalfa farms, 10 to 40 acres. E. L. McCune, Yuba City, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

MACHINERY.

For Sale—Second-hand windmills, tanks, engines, farm machinery that will do same work as new at half price. Complete saw mill, including stickers, circular and band saws, blower, planers, 80 h. p. steam outfit. 140 ft. 2½-inch standard at 9½c; 1600 ft. 2-inch at 7c. 8 ft. steel aermotor windmill complete with tank and pump, $48. Small distillate tanks, 50 gallons up. Domestic and irrigating tanks, galvanized and 500 to 10,000 gallons, also 50,000-gallon redwod tank, fine for storage or irrigating. Steam engines with steam pumps; gasoline engines, 3½ h. p. engine, pump jack, pipe, pump complete, $90 F. O. B., also many other sizes. 12 h. p. Fairbanks engine, No. 2 deep well Ames double-acting pump jack, 65 ft. casing, rods, and double-acting cylinder, 50 ft. belt, all complete and now pumping 20 inches water from 65 feet well into large reservoir 110 feet on top of hill. Our price $380 on cars if taken before we have to move it. Gang, disc, road, riding, walking plows, feed rack, bone grinder, Fresno and slip scrapers, wagons, surrey, grading tools, sundries. Demmitt Co., upstairs, 120 N. Main, Los Angeles.

For Sale—One No. 3 Ames pump, 125 ft. of rods, 8 inch cylinder, also one 22 H. P. Fairbanks-Morse engine. All for $1,000.00. 1½ miles north of Olive, ¾ mile south of Richfield. J. H. Gulick, Olive, Cal.

For Sale—25 h. p. Fairbanks-Morse engine. Got this a few days ago. Repairs needed were few. Condition now excellent. Our customary guarantee given. Bailie & Brandt Company, 943 and 945 N. Main street, Los Angeles, Cal.

For Sale—9 and 15 h. p. Foos Distillate engines. Will install if desired. Machinery Exchange, Main and Bruno streets, Los Angeles, Cal.

TURKEYS.

For Sale—Thoroughbred Bronze Turkeys from 38 to 40 lb. Toms, and 15 and 20 lb. Hens. Young Toms $5.00 to $7.00, young hens, $3.50 to $4.00. Pairs and trios not related. Mrs. P. E. Tucker, Tulare, Cal., R. D. 1.

POULTRY.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal.

Hayes, R. B., Poultry Fancier and Rhode Island Red Specialist—30 breeding pens of Reds, 20 pens miscellaneous varieties. See our birds, they tell their own story, or write for circular. Eggs for sale only. Yards in Arroyo, opposite Ostrich Farm. Box 85, Garvanza Sta., Los Angeles, Cal. Phone East 1631.

LOVELL'S BLACK MINORCAS
California's
Greatest Egg Producers

Pedigreed, trapnested, scientifically **bred.** Free circular. DAVID J. LOVELL, 5720 So. Park Ave., Los Angeles, Cal.

Day-old Chicks from my pure bred and carefully selected stock of S. C. White Leghorns from January 15 to February 15, $10 per 100; after February 15th, $9 per 100. Spring orders taken now. J. R. Heinrich Poultry Yards, Arroyo Grande, Cal., San Luis Obispo County.

Eggs for Hatching—Black Minorcas, Barred Plymouth Rocks, Rhode Island Reds and Buff Orpingtons, $1.00 per 15, $5.00 per 100; day old chicks 15c each. Cockerels $2.50 and $3.50. Stamped envelope for reply or cash with order. (No more pullets). L. W. Neilsen, R. R. 2, Box A1, Petaluma, Cal.

BONNELL'S S. C. BLACK MINORCAS
WIN EVERY TIME.

A few cockerels for sale. C. C. Bonnell, State Vice-President American Black Minorca Club, 2919 Brighton Ave., Los Angeles.

I Hatch White Rocks Exclusively—Chicks $15 per 100 from a heavy laying strain of prize winners. I am booking orders now for later delivery. Can supply stock from 1 to 10 weeks old. Write for prices. J. Wesley Lord, Inglewood, Cal.

Petaluma Hatchery—Capacity 50,000 eggs. We are booking orders for spring. Write for circular. L. W. Clark, 615 Main St., Petaluma, Cal.

For Sale—White and Buff Wyandottes from best strains. W. C. Parker, 113 Pacific Ave., Santa Cruz, Cal.

Lodi Hatchery—Just hatched, White Leghorn chicks from healthy, heavy laying stock. Booking orders for later delivery. T. C. Hawley, 504 E. Elm St., Lodi, Cal.

Single Comb Brown Leghorn Eggs—$5.00 per hundred, $1.50 single setting. **Mrs** E. Foran, Box 445, Visalia, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. Allaway & Layton Co., 607 E. 3d St., Los Angeles, Cal.

Pacific Hatchery—Baby chicks, incubator eggs, and selected thoroughbred poultry, ranch raised. W. W. Clough, Ontario, Cal.

Orland Hatchery—Just hatched White Leghorn Chix. Booking orders for later delivery. P. L. Simpson, Box 13, Orland, Cal.

Baby Chix—1,000 will hatch Dec. 15th. Who wants them? First come, first served. Sussex Poultry Manor, Los Gatos, Cal.

Baby Chicks and Eggs for Hatching—Orders now taken for January and later delivery of R. I. Reds (Tompkins Strain), White Minorcas and S. C. Black Minorcas (Northrup Strain). C. U. Chamberlin, Los Gatos, Cal.

DAIRY SUPPLIES.

Have You a Cow?—Have you a creamery? Have you a cheese factory? Write us. Everything used in either a dairy, creamery, cheese factory, or for handling milk, cream, butter, or cheese. We are in a position to quote you prices on entire creamery or cheese-making outfits. We make a specialty of only the latest and best sanitary machinery and supplies. Send us a list of what you want and we will quote prices which we feel certain will interest you. O. J. Weber Co., 225-227 East Sixth St., Los Angeles, Cal.

Milk Coolers, Bottles, Caps, brushes, Buhl milk cans, Sharples separators, Babcock testers, veterinary instruments, wood soled boots and shoes, and our celebrated "Prosperity" washing powder. Guy F. Kelsey, 108 E. 8th St., Los Angeles, Cal.

HORTICULTURAL PRINTING.

The Kruckeberg Press, 123 South Los Angeles St., Los Angeles, Cal., makes a specialty of Horticultural Printing and Engraving. Cuts and illustrations of all standard, economic and ornamental plants on hand and subject to the use of patrons without cost. Samples and estimates cheerfully furnished. Remember, we design, write, engrave, bind and print; in brief, do the "whole thing," at no additional expense to the customer. Correspondence a pleasure.

A BARGAIN.

"Yes," said the specialist, as he stood at the bedside of the miser-millionaire, "I can cure you."

"But what will it cost?" came feebly from the lips of the sick man.

The specialist made a swift mental calculation. "Ninety-five dollars," was his answer.

"Can't you shade your figure a little?" wailed the other. "The undertaker's bid is much less."

When the children know more than they ought to, it may be because the parents do not know as much as they should.

WORRY DOES KILL.

Modern science has brought to light nothing more curiously interesting than that worry will kill. More remarkable still it has been able to determine from recent discoveries just how worry does kill.

It is believed by many scientists who have followed carefully the growth of the science of brain diseases that scores of the deaths set down to other causes are due to worry and that alone. The theory is a simple one, so simple that any one can readily understand it.

Briefly put, it amounts to this: Worry injures beyond repair certain cells of the brain, and the brain being the nutritive center of the body, the other organs become gradually injured, and when some disease of these organs or a combination of them arises death finally ensues.

Her Haunting Fear.

Bridget: Time brings many changes, Nora.

Nora: Indeed it does.

Bridget: Whin I was little I used to cry for fear the policeman would get me, and now I cry for fear I won't get the policeman!—Harper's Bazar.

THAT ENGLISH AGAIN.

(From Judge.)

"Waiter, make a good fire at once, for I am awfully wet; and bring me a drink, for I am fearfully dry."

Don't neglect the cultivation of the children. They are the best crop raised on the farm, and deserve careful attention.

150 HEAD OF
Cows and Horses
130 TONS OF
Alfalfa and Oat Hay

Known as the Chicago Dairy and Stock Farm, corner of Florence and Central Ave., Los Angeles.

Tues., Nov. 29, at 9:30 Sharp.

Herd consists of 100 head of fine dairy cows, Holsteins, Jerseys and Durhams, young and in fine condition; many fresh, giving large quantities of milk others coming in soon. One of the finest dairy herds in Southern California. 14 head of fine Heifers coming fresh; 12 fine heifer calves, 2 thoroughbred Holstein bulls, 4 years old; 1 blue Durham bull, 2 years old; Jersey bull, 2 years old. This herd was started by Mr. Escallier and all stock has been carefully culled and selected from the finest milking strains in the state. The cows are in the very pink of condition and no finer herd of dairy stock can be found anywhere. Owner especially requests parties interested in dairy stock to inspect this herd and see them milked prior to sale, at 4 p. m. daily.

One black work team, 5 and 6 years old, weight 3000 lbs. sound; 1 black and roan team, 4 and 6 years old, weigh 3750 lbs., sound; team of geldings, years old, weight 1400 lbs. each, sound 10 head of all purpose horses and mares weight from 1000 to 1250 lbs. each, al good ranch stock and all broken.

68 tons of baled alfalfa hay; 40 tons of baled oat hay; 40 tons of stacked alfalfa hay; 3 sets heavy work harness 3 sets light wagon harness; 3 sets single driving harness, one Concord buggy one fine milk wagon, same as new, cos $265; one small milk wagon, boiler three bunk houses, tool shop, can house cow barns and stanchions for 60 cows etc. One heavy hay wagon; one ligh hay wagon.

Owners are positively retiring from the dairy business and closing out thei entire dairy and ranch outfit, and if yo are in the market for first-class stock do not miss this sale. Teams will mee Central ave. cars at end of line, betwee 8:30 and 10 a. m., Tuesday morning, o take Watts local to Florence avenue Walk one-half mile west.

Terms $100 and under, cash; over $10 one-third net cash, balance six months time with bankable note and eight pe cent. interest; three per cent. discoun for cash on time sums.

IN COMMON THINGS.

Seek not afar for beauty, Lo! it glows
In dew-wet grasses all about thy feet;
In birds, in sunshine, childish faces sweet;
In star and mountain summits topped with snows.

Go not abroad for happiness. For, see!
It is a flower that blossoms by thy door;
Bring love and justice home; and then no more
Thou'lt wonder in what dwelling joy may be.

Dream not of noble service elsewhere wrought,
The simple duty that awaits thy hand
Is God's voice uttering a divine command;
Life's common deeds built all that saints have thought.

In wonder-workings, or some bush aflame
Men look for God, and fancy Him concealed;
But in earth's common things He stands revealed
While grass and flowers spell out His name.

The paradise men seek, the city bright,
That gleams beyond the stars for longing eyes
Is only human goodness in the skies.
Earth's deeds, well done, glow into heavenly light.

MINOT J. SAVAGE.

ONE OF GOD'S CHARADES.

This morning I witnessed a deed that ought to be recorded and rewarded.

I had been enjoying an all too rare treat, a morning gallop with Kitty—kindest of little beasts man ever bestrode. I had left her at the stable, and was walking home along Broadway, when, at the crossing, I came upon a knot of twenty or more men, boys, policemen, and standing teams. A sewer main had lately been laid across the street and the hind wheel of an overloaded truck wagon had found in the new pavement a soft place close by the track of the tram, and had sunken so deeply that the horse, great noble-looking fellow as he was, could not have drawn it out had he been multiplied by four.

Drivers, policemen and volunteers had been at work with great timber evers and planks and blocking, to ry up the sunken wheel; but the nost they had accomplished was to et the end of a scantling nearly unler the wheel in such wise that if it ould be rolled foward at all, the cantling would make an inclined lane up which the wheel could climb ntil it should reach the pavement evel.

With everything in readiness, and ll the "pries" at work, the men made final appeal to the strong and spired bay to pull once more. Once nd again he responded generously, t without effect. Then he desisted nd continued to desist, saying good turedly, but as plainly as ever orse could, that it was useless and human to put one horse, however rong, to do the work of four.

It was now nearly time for the ectric to come whizzing down the obstructed track. Something must be done at once. "There is no help for it," said the boss of the trucking teams—"there is no help for it; we shall have to bring on Old Whitney." So the well-groomed bay was led out of his shafts and Old Whitney taken from another loaded wagon. She had by no means the spirited look of the bay. Her arching neck had long since sunken to the general level of her dorsal skyline. Her great ears seemed incapable of motion, and her face was pathetically heavy and sad. Each several hair lay just where the drying from unnumbered sweats had left it, and no two seemed to lie together.

Her gaunt hulk was soon backed into the heavy truck shafts, and the trace chains made fast to the whiffletree—at first a little too short, then lenthened a bit to give her sea room. There was no savage jerk upon the bits, no brandish of whip, no blow, no angry yell, nothing but a giving of free rein, and the projection of—what shall I call it? I have heard all sorts of sounds addressed to equine ears by men of many tongues and languages, but this I never heard before. It had for a basis the kiss-like sound so commonly used by American horsemen, yet some way it was peculiarly vocalized with an indescribable guttural explosion that was amazingly penetrating and human. It was at once coaxing, commanding, trustful, strenuous, kindly, authoritative, desperate, and I know not what else.

Old Whitney at once lifted her heavy ears, and as another and another of these insistent kisses were thrown at her, she suddenly took on the aspect of a new embodiment of life. She tested her tackle carefully, she felt the ground over with her feet, to find if there were slightest points of vantage, she ascertained the central line of deadweight draft, and swinging herself one point off it to the left, gave a good, generous one-horse power tug at the immovable mass.

In vain.

Then swinging round two points to the right, she gave another, surely a two-horse power lift at the terrible load.

Immovable it remained.

Another coaxing, confident, kindly, anxious kiss thrilled through her excited brain—another.

She now fully took in the situation. It was an emergency. She knew what an emergency meant. She had been called on before. She was this man's only present hope. Swinging once more a trifle on the great kingbolt and drawing a deep, deep breath, she suddenly bowed her sinewy neck and bony frame, and with a lunge that would have launched a world had creation been her business, she dashed with straining strides across the twenty feet of treacherous pavement and trembling in every fibre of her being landed her inhuman load upon the solid street.

Well might the crowd stand breathless, as it did. Such perfect intelligence as to every ounce of help she could extort from the lay of the street, and from the leverage of the kingbolt—I fear also perfect intelli-

ARE YOU ONE OF THEM?

There are multitudes of young people who are not in the public schools, but who look to the business college for the special educational training and finishing needed preparatory to lucrative business employment. Of such over a half thousand enroll every year at the ISAACS-WOODBURY—the recognized leader since 1884.

We have abundant teaching force of the highest grade, clean and inviting rooms, with perfect light and ventilation—100 FEET ABOVE STREET NOISE AND DUST. Call, write, phone. New Catalogue—27th year.

Oakland's New Engineering College

THIRTEENTH AND MADISON STREETS

Polytechnic College to Have Elegant Building and Equipment

The magnificent new re-enforced concrete engineering building of the Polytechnic College, at 13th and Madison Sts., Oakland, is nearing completion. This new and modern building, together with extensive equipment, will give this college superior facilities in all departments of engineering work. This institution appeals to young men who wish a high-grade course in all the essentials, but who cannot spend four or five years in college.

Contracting and Practical Work

The crowning feature of the Polytechnic College of Engineering is in combining practice with theory. It is, perhaps, the only school in the United States that engages in actual engineering and construction work, and gives its students actual practice while pursuing their courses.

Complete courses in Civil, Electrical, Mining, Mechanical, Hydraulic, Gas and Steam Engineering; also in Architecture.

"There's very little heat. But try this with an ordinary lamp and see what happens."

LIGHT—NOT HEAT

The Angle Lamp gives less heat than any other method except incandescent electricity. Will *not* scorch or discolor your ceiling, etc. Eliminates possibility of fire. Gives well distributed shadowless light without dangerous and unpleasant heat—delightful to read or work by.

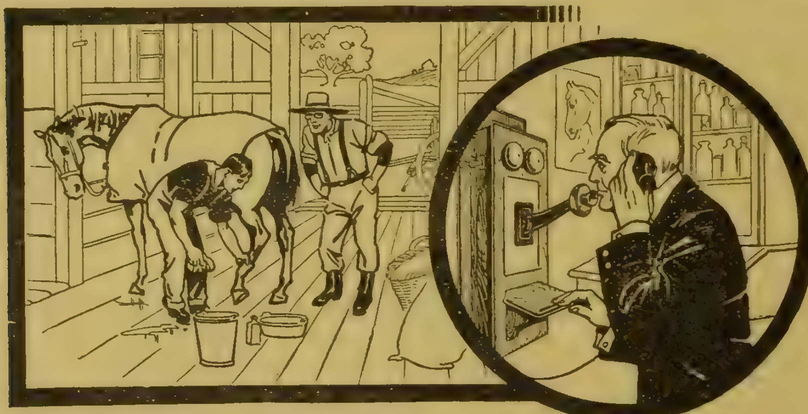
The Angle Lamp

is the simple, economical, convenient and perfectly satisfactory method of burning common kerosene. It *never* smokes or smells whether burned at full height or turned low. *Lighted and extinguished like gas.* Filled like a water bottle. Requires filling about once a week.

The Cheapest Form of Light

Being fully ⅓ to ½ more economical than even the ordinary lamp it soon saves its cost. It is made in 32 varieties. Come in and see it or *write for catalog.*

Boesch Lamp Co. 1135 Mission St. San Francisco
Established 1869. Incorporated 1890.



Indispensable in Emergencies

THE sickness of a valuable animal on the farm demands prompt remedies.

It 's a case for the veterinary — a case where minutes count. That 's where the Bell Service shows its value to the farmer.

By means of the telephone the veterinary is reached, and he at once tells the farmer what to do until he arrives.

No far-sighted farmer gets along without the protection of the Bell Service.

He can never tell when it is going to save him from serious loss. Besides, he has daily proof of its usefulness.

Consult our local manager for rates.

The Pacific Telephone and Telegraph Co.

Every Bell Telephone is the Center of the System

Charges for Soil Work

(Temporary)	PER SAMPLE
Mechanical Analysis (five grades of fineness)	$1.00
Lime and Magnesia Determinations (available)	1.00
All the above with Phosphoric Acid, Chlorine, Alkalinity, and approximate Humus	4.00
Potash	1.00

SAMPLES—Take surface sample from first foot: subsoil from between 2½ and 3½ feet depth; deep subsoil from between 7 and 8 feet depth. One pound is enough for a sample if well mixed before dividing down. PRICES—These prices are in force only while advertised.

gence as to the cruelty of the imposition. Such desperate power of will; such willingness to will desperately; and all, not to escape the task; but merely to serve and please her master in his hour of need. I could not stop to pat her infinitely pathetic face, nor even to see if her driver gave her unkempt forelock one little approving pull. The tears were rolling down my cheeks and I had to hasten away.

Old Whitney had been counted on, and old Whitney had met all expectations.

Postscript.—The foregoing illustrates so many things in human life, and is so capable of yielding a moral that I fear some readers will be tempted to take it for a parable merely. To any such I wish to say that I have reported the incident exactly as I saw it on the open streets. It is not a parable, but I strongly suspect it gives us an acted charade whose divine significance men should try harder to guess.—The Independent.

CHRISTMAS BUYING.

Memories of buying Christmas presents the day or several days before Christmas should be sufficient to induce everyone to begin immediately to purchase and lay aside presents which will be needed at that time. It is born in human nature to put off such a task until almost the last moment, then, with clerks tired almost to death and stores packed so full that it is impossible to get a proper look at any article, selection is out of the question.

For the next few weeks attention may be had from the best clerks in the stores, fresh goods may be secured to choose from and instead of hours spent in fruitless worry a few moments complete the task satisfactorily.

The advantage of early shopping should be especially appreciated by Californians who send packages by mail or express. The two weeks preceding Christmas find the mail cars stacked to the roofs. To be sure, one wishes the present to arrive as near Christmas day as possible, but a package with "To be opened on Christmas day," sent two weeks in advance, will only add to the recipient's zest by keeping him wondering what is in that package.

APPLE RECIPES.

Jellied Apples.

One qt. water, 1½ cups sugar, juice of 1 lemon. Boil 10 minutes in porcelain saucepan. Pare, quarter and core 8 medium sized Watsonville Bellflower, or other tart apples, and cook in the above syrup until tender. Remove them carefully to a mold. Dissolve ½ package gelatine in 1 cup water, strain, add to syrup. Pour this over the apples and set mould in a cool place until the contents harden. Serve with whipped cream.—M. H. S.

Apple Custard Pie.

Pare and cook 4 tart Watsonville apples. Beat with a fork, and add 1 scant cup sugar, 1 tablespoon butter nutmeg, ginger, lemon essence, pinch of salt and scant tablespoon cornstarch mixed with milk. Break into a cup 2 eggs, beat well and add enough milk or cream to fill the cup. Mix well with apples and cook the mixture. Line pie tin with good crust and when it is baked pour in the custard. Meringue of whites of 2 eggs beaten with 2 heaping tablespoons sugar. Spread on pie and brown in oven.—C. B.

Baked Apple Dumplings.

Pare and core tender Watsonville apples and fill with sugar. Make a dough of 1 cup mixed lard and butter, 1 qt. flour, 3 teaspoons baking powder, salt and milk. Roll, and cut out the pieces, placing an apple on each piece. Fold the dough to cover the apples and grate nutmeg over them. Place in pan with water to half cover, and ½ cup sugar and butter the size of an egg. Baste while baking. Serve with hard or liquid sauce.—J. R.

Apples a la Manhattan.

Peel and core tart Watsonville apples. Bake with half a cup each of water and sugar.

Make a syrup of 1 cup of water, ½ cup of sugar and the juice of half a lemon. Add 2 tablespoons each of chopped raisins, chopped candied cherries and chopped blanched almonds, and cook slowly for half an hour. Place the apples in individual glass dishes and cover with the cooked sweets and syrup. Serve cold with cream.—A. M. W.

German Apple Cake.

One cup of butter, two cups of sifted flour with two level teaspoons of baking powder (or two cups of self-rising flour), two well beaten eggs, and milk enough to make a rather soft dough. Roll thin and lay in pie plates. Cut any tender Watsonville apples in sixteenths and lay them on top, pressing them lightly into the dough. Sprinkle with cinnamon, sugar and tiny bits of butter. Bake until the apples are cooked.—A. E. H.

Apple Sago Pudding.

One cup rather thin apple sauce, 1 rounded tablespoon sago. Cook together in double boiler until sago is done. Pour into mold and serve cold with whipped cream, sweetened and flavored with nutmeg.—L. M. J.

Apple Sauce Filling for Layer Cake.

One cup Watsonville apple sauce, 1 cup powdered sugar, whites of 2 eggs. Beat whites until stiff, add sugar and sauce and beat until white and of the proper consistency for filling.—L. M. J.

Apple Tarts.

Roll out rich puff paste and cut into rounds with a biscuit cutter. Make half of them into rings by removing the centers with a smaller cutter. Place the rings on the rounds and bake. Fill with Watsonville apple jelly or apple sauce and garnish with whipped cream.—J. E. S.

Apple Pudding.

Stew ½ doz. Watsonville apples and sweeten. Pour over the fruit a batter made of ½ pt. milk, 2 eggs, butter the size of an egg, 2 teaspoons baking powder, and the necessary amount of flour. Bake and serve with any sauce.—J. R.

Apple Sauce Cake.

Sift together 2 cups flour, 1 cup sugar, 2 level teaspoons soda, 1 teaspoon cinnamon, ½ teaspoon cloves, ½ teaspoon nutmeg, 3 tablespoons chocolate, 1 tablespoon cornstarch. Add 1 cup chopped walnuts, 1 cup raisins. Last add 1½ cups apple sauce and ½ cup melted butter.—R. D. R.

Apple Sauce Cake.

One and one-half cups apple sauce (strained and sweetened.) 1 cup sugar, 2 cups flour, 1 cup seedless raisins, ½ cup butter, 1 tablespoon hot water, 2 teaspoons soda, 1 teaspoon cloves, 1 teaspoon cinnamon.—C. A. J.

Dried Apple Fruit Cake.

Three cups of dried Watsonville

Eucalyptus Seeds

In large or small quantities, 33 kinds to select from. Write for free pamphlet "Eucalyptus Culture." It gives full directions for sowing the seed, raising the plants and planting out into the field, together with descriptions of all the leading species, giving their uses and the localities to which they are adapted. Sample packets 15c each, 2 for 25c, 4 for 50c, 9 for $1.00. Choice Flower, Garden, Tree and Palm Seeds, Roses, Flowering Plants etc. Catalogue mailed free upon application.

apples soaked over night in cold water enough to swell them. Chop and stew until almost soft in 3 cups molasses. Add 1 cup seedless raisins and stew a few moments. When cold add 4 full cups flour, 1 cup butter, 3 eggs and 1 teaspoon soda. Bake in a steady oven. Raisins may be omitted, or spices and walnuts may be added.—L. M. J.

Apple Sundae.

Stew sour Watsonville apples, sweeten, strain through wire seive. Add whites of 2 eggs and 2 teaspoons gelatine (which has been dissolved). Whisk briskly until stiff. Line dish with split bananas or oranges and pour in the fruit, sprinkle top with chopped nuts and add a syrup made of sugar and a little strawberry juice. —S. M. N.

PANTS.

Gentle reader, do yours fit? They do not. Why? You do not know. Do those of your neighbor fit No. Why? He does not know. Nobody knows. Nobody can tell or give him a rational guess. The whole subject is shrouded in mystery and doubt, yet it never has been investigated. Alike in belles-lettres and in scientific theses it remains unknown. Yet what subject approaches it in wide and catholic interest?

All the world wears the humble pant, but no great mind has ever pierced the mystery which enfolds its, or their, history, purpose, merits, and defects. Thus, the word is often used in the plural form but there seems to be no more valid reason for this than for the peculiar nature of the article itslf. Again, this same garment is sometimes called a trouser, or trousers. There seems no reason why we should not use the shorter and uglier word. There can be given no worthy reason, either, why this article, or these articles should ever have been invented, ungainly, uncomfortable, ungraceful, uneverything. They drag at the bottom and bag at the knees, are wholly without form or comeliness. Moreover, they cost from four to twenty-four dollars; either of which sums is a lot of money.

Yet we wear them. Why? If you stop to think of it, you will be unable to answer. For centuries this custom has existed without any foundation of reason. Why? For ages this great question has been asked and has been left unanswered. If you will gaze into the face of the Sphinx, smiling, inscrutable, you will, after reading this, have a better idea of what is on the Sphinx's mind. Why are pants? That is the unread riddle of the ages.—November Everybody's

CLEANING LACES AT HOME.

When laces are sent to the cleaners they are often sent home looking beautifully clean but very much injured by the use of cleaning fluids. Any kind of lace can easily and safely be washed at home. Delicate white lace can be cleaned by washing in alcohol by using it as if it were water. Put the lace in the fluid and allow it to soak for ten minutes, then wash by lifting up and down and pressing and squeezing between the hands and rinse in clear alcohol. If a creamy hue is desired the lace can be dipped in water to which some stained coffee has been added until the right shade is procured.

The best way to dry lace is to baste it to a cloth drawn tightly over a smooth board, but it should be very carefully pulled into perfect shape, and it should be kept damp while it is being handled. The best way to dry a short piece of lace is to spread it smoothly over a large window pane while it is still damp and when perfectly dry the lace will be crisp and new in appearance.

Battenberg lace and other white laces that are soiled enough to be washed are made beautifully white and clean by putting them to soak in warm borax suds and if very soiled they should be allowed to remain over night, and the lace will not be torn or stretched if it is basted upon a piece of white cloth before washing.

If the laces are very soiled a tablespoonful of borax should be used to a quart of water. Wash the lace though this suds, then rinse through three or four waters to get rid of all suds, then put in a clean bowl and pour enough hot borax water over the lace to cover it well and let stand closely covered until the water is cold, then squeeze this water out and dry without rinsing. This water will not only whiten the lace but give it just the right degree of stiffness, and there is nothing better than the hot suds for cleaning white lace veils or any lace trimmed article.

Black lace may be freshened by washing and rinsing in cold tea, and as a hot iron will make black lace appear rusty, the best way to dry the pieces is to wind them around a bottle filled with hot water and then pin a soft cloth over the lace.—M. H.

THE HOT WATER BAG.

The idea that a hot water-bottle at the feet is unhygienic and should be resorted to only in the coldest weather, if at all, is pronounced absurd by physicians. If there is a tendency to insomnia or a sense of fullness in the head at bedtime, a hot-water bottle offers one of the simplest and most effective methods of drawing the blood away from the brain, thus superinducing sleep. One fruitful cause of wakefulness at night is an excessive supply of blood to the brain. The cerebral arteries are stimulated, and with them all the mental faculties. The purpose of sipping hot milk just before composing oneself to sleep is as much to draw the blood away from the brain by giving the stomach something to do as to fortify the stomach against hunger. A hot water bottle at the feet performs a similar mission and should be employed whenever needed, irrespective of the calendar.

JUST "PLUG."

Everyone is not a howling success, and those who overtake it are compelled to run fast, work hard, jump high, and keep everlastingly "plugging." Cleverness counts for something, but to the fellow who "plugs" from Monday morning till Saturday night, belongs success, and he is the one of whom we speak as being lucky. It's not luck, however, but that eternal "plugging" whose reward is inevitably success.

To judge a man by a single act is to apply the law of exception rather than the law of average.

Nearly every one is better than he supposes the other fellow would be under the circumstances.

Hay.

Receipts of hay for the week ending today were 3804 tons. This amount was in excess of what was required during the week to supply the daily demand at this time. There is a thorough dullness pervading the entire trade in all its branches.

The statement recently issued by the Hay Association showing available warehoused stock in the country tributary to the San Francisco market of 280,000 tons, is anything but an encouraging feature of the situation.

The shipping trade is also quiet, as there has not been as much hay moving out of this port recently as we were shipping a month ago.

The trade on alfalfa is also quieter, and the market a bit dull. The field has been cleared up, and practically the last of the hay has come into the market here during the week, and from now on warehoused stock will have to be drawn on to supply the trade.

Deciduous Market

SACRAMENTO, November 19, 1910.

The following circular of the California Fruit Distributors gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, November 18th, 1910:

Grapes:. 79 cars.

This record shows shipments about one hundred cars less than the preceding week. It is not likely that there will be more than twenty-five or thirty cars yet to go forward and most, if not all, of these it is expected will be shipped during the early part of next week.

Citrus Market

LOS ANGELES, Nov. 23, 1910.

The shipment of green fruit continues and in quantity with a still further depressing influence than chronicled last week. $1.65 to as high as $2.00 f. o. b. California is, however, being received. So far navel shipments have practically all been from either Butte or Tulare counties. Southern California shipments from a very few sections may begin the last of this week, and all will probably continue shipping from now on. It is probable that by the first of December that 90 per cent of the northern and central output will have gone to market.

Lemons are lower and it is probable no more fancy prices will prevail until the warmer season opens. The fruit is of exceptionally fine quality and from present indications next spring's cut will be very heavy.

Shipments.

Shipments of oranges since November 1st, 1910, 73 carloads, of lemons 260 carloads, total of all citrus fruits 333. To same date last season, 151 cars oranges, 156 lemons and total 307 cars citrus fruits.

NEW YORK, Friday, Nov. 18.—Three cars of Valencias and 3 cars of lemons were sold. The market was higher on Valencias and easier on lemons. The weather was clear and fair.

Navels, California, 96s, 2.00; 126s, $2.75; smaller sizes, $3.00.

DILL AS A MONEY CROP.

In the central part of Long Island, farmers grow a good number of acres of cabbage, cucumbers for pickles, peppers, also green tomatoes for pickling, and dill is one of the main articles in pickling all of the above with the exception of cabbage.

The dill seed is sown in rows two and one-half feet apart the same as carrots about May 15. Use care to secure the mammoth variety as the dwarf is not profitable. Keep free from weeds and keep well cultivated until the dill is fit for market, which generally is from August 1 to September 1. The demand usually exceeds the supply, for same is generally contracted for by local pickling plants at from $35.00 to $60.00 per ton. An acre yields from one to three tons, depending on season and care given same. The Mammoth Dill grows from two and one-half to four feet in height and is pulled up with roots, put into bundles of from 25 to 100 pounds, put on wagon and weighed at pickling plant.

Any farmer being near a pickling plant could add to the yearly income by planting some of this valuable herb. All of the dill stalk is used with the exception of the roots and six inches of the stalk.—Market Growers Journal.

Feed the birds. You'll need 'em next bug time.

California Cultivator

Clubbing Price List

FOR THE SEASON 1910-'11

Prices are Good to Oct. 1, 1911

This magazine price list is prepared annually for the convenience and benefit of Cultivator subscribers. The prices given allow our readers the benefit of the lowest figures possible, in return for which, all we require is that to all orders a year's subscription to the Cultivator (class 18) be added at 90c (regular price $1.00 per year).

This year the pricing of various combinations of magazines is a simple matter; all are listed according to class number and this class number multiplied by 5 gives the cost price.

EXAMPLE:

Class No.		Regular Price
20	American Magazine	$1.50
16	Delineator	1.00
37	World's Work	3.00
18	Cultivator	1.00

91X5=$4.55. Club price for all. Amount saved on this club, $1.95.

We desire to especially call attention to this complete list of the most popular magazines. We can, however, supply any periodical published, at the lowest price, and any not listed here will be quoted on request. Let us make you a price on any combination you may desire.

Periodicals in any combination may be ordered to the same or different addresses. Foreign or Canadian subscriptions are extra on account of added postage and prices must be gotten by correspondence. Subscriptions may be either "new" or "renewals," but it is important that this information be given in each case.

Books—Send us a postal for our list of agricultural books which we supply subscribers and which we recommend as most suited to California conditions.

Don't overlook this special:

The California Cultivator (weekly)
The Rural Californian (monthly) } Both one year for $1.50

Our Money-Saving Combinations:

The price of the Cultivator and any single magazine may be obtained by adding 90c to the class price of the magazine desired.

Make up your orders from the following, noting that the class numbers multiplied by 5 gives the cost price. Also bear in mind that all orders must include a year's subscription to the Cultivator (class 18) at 90c.

POMONA CIRCULAR VALVE

THE main object of the Pomona Valve is to construct a very cheap and simple valve, and one that requires no special tools or wrenches or experience to operate.

The Pomona Valve is constructed with non-corrosive parts, thus insuring a workable valve regardless of infrequent use. All fastening held in place by cotter pins, thereby making a very cheaply constructed valve and yet a very substantial one.

California Cultivator

An Illustrated Weekly Magazine, Devoted to the Rural Home and Ranch. One Dollar per Year.

Los Angeles December 1, 1910 San Francisco

CALIFORNIA SWEET PEAS.

There is possibly no annual that finds conditions of soil and climate more to its liking in California than the sweet pea. Being susceptible to a warm and constant sun, a long growing season and a fertile soil, it attains a growth and robust development of seed unknown elsewhere. The illustration shows the quality of California blooms, and pictures one of the late introductions of the Howard & Smith Nursery of Los Angeles, Cal.

The LaVerne Rotary Cultivator

The principle of Rotary Cultivation, is an entirely new one; the action of the teeth in the soil being different from solid, cut away Discs or ordinary Cultivators. It carries absolutely no soil with it and can be used at a greater depth with less draft than any other cultivator on the market today. The tool, works so close to the ground with no wheels or other attachments to catch limbs or tear off fruit, that it can be used to cultivate under the trees, where ordinary tools do not reach. The manner in which the teeth enter the soil, tends to keep them sharp and one set usually lasts a season.

We guarantee satisfaction in regard to work and quality of construction.

Features of Vineyard Work in San Joaquin Valley

A New Insect Destroyer Described by Mrs. Minna E. Sherman; Also Other Vineyard Practices Which Aid in Producing Fine Grapes.

Three troubles have been a source of loss in this section of the vineyard country. The vine hopper, mealy bug and mildew have all been more than usually troublesome. The mildew and hopper are familiar troubles, the mealy bug is rather a new enemy to the vine. The vine hopper is a small whitish little fellow with a peaked back when his wings are closed. He fills the air at times when a vine is stirred up. I have seen them this year so numerous that the horse closed his eyes and I closed mine and we staggered into a high vine, to the destruction of the mud-guards of the phaeton. This season was as bad for hoppers as any I have ever known. The effect of the hoppers is weakening on the vines, and in vineyards where they have prevailed for several seasons, the vines show a serious check in their wood growth. The leaves turn brown in July and August and the fruit hangs exposed to the sun's rays. In cases not quite as bad as this, the berries on the bunches are often seriously marred by the excrement of the hopper. The effect on the vine generally is about as though it was pruned in August. The effect on the shipping fruit is to make the grapes soft and not good carriers.

Sprays.

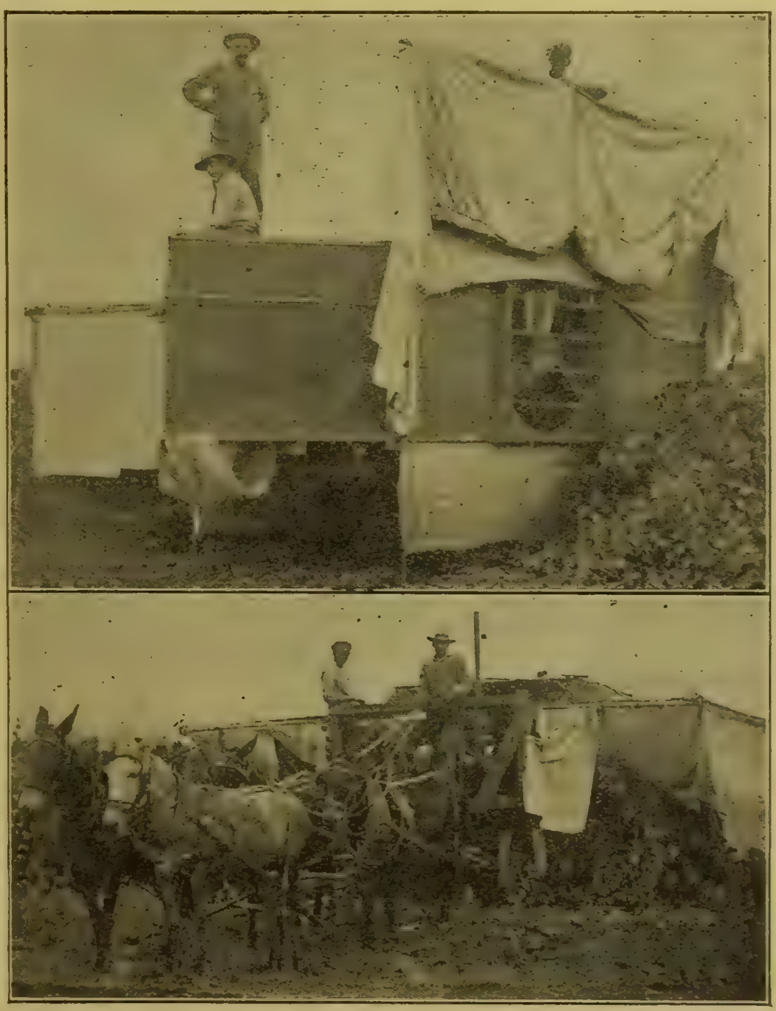
Sprays have not proven any good, as the hopper is a sucker and anything that will prevent his getting the juices from the leaves will destroy their usefulness to the growth of the vine. Various arrangements of traps have been devised. One was drawing a truck with a series of sticky fly paper on the sides. Another way was formed with a box trap put over the vines and then shaking them up, when the hopper flew to the top to the light. Neither of these devices proved valuable in securing more than a few of the hoppers. They should fly right to be caught, but they did not.

Driver's Hopper Catcher,

The picture illustrates fairly well the working and form of this machine that has been patented by Mr. C. B. Driver of Dinuba. The Farmers' Institute force was taken out to see the machine in operation. It was late in the season to see the full amount of hoppers sucked into the machine. It took all that were there, however, successfully. The device consisted of a large cage-like box made of screen wire in the back and on the two sides directly opposite the fans is used an inch mesh wire to allow the hoppers to pass in more readily. The fans, propelled by the engine inside, draw the hoppers in with great force. The suction is very strong and when the hoppers are drawn into the cage they are forced back against the wire screen and then fall dismembered to the bottom of the wagon, onto a table that slants to a gutter that runs to one corner, where they drop through an aperture into a suspended sack. A careful examination of the pictures will show these details.

Curtains.

The hinged arms carrying the curtains extend out over a row of vines on each side of the wagon The first curtain is split and yet trails over and stirs up the hoppers. The side curtain holds them within reach of the suction of air while the trailing rear curtain forces them forward into the air. We got under these curtains ourselves and went along to see the machine in action. A short trip was enough, as every hair was on end and everything loose was pulled out of place. We were satisfied that the suction was enough to draw in Mr. Hopper to his death. We then examined a vineyard that had had the machine used on it early in the season. Every leaf was green and perfect and vigor was very noticeable over the whole place. Across the road was an untreated vineyard. The foliage was brown and the tops of the vines completly denuded. This machine did its work successfully, and to all appearances it is easily enough operated to be successfully handled by the ordinary enginneers employed on the ranch. On an eight-acre vineyard there were caught forty-four pounds of hoppers in one trip. These were estimated to represent several million individuals. The computation was made carefully by having the druggist weigh out a grain of them and then counting the victims. These were multiplied by the number of grains in the total amount and the estimate arrived at.



HOPPER CATCHER.

Side view showing curtain raised, fan and protecting screen over fan. One curtain in place.

Front view showing both hoods ready for use and showing the manner in which they cover staked vines.

This is rather under than over the correct amount, as many of the hoppers are so ground up that they were counted out among the dust and other waste gathered in by the fans.

Mealy Bug.

This new pest has taken to the vineyards for the first time in noticeable quantity. Even now not more than half a dozen cases are reported. One vineyard that was considered as a total loss early in the season produced a full crop. The owner thinks it is the work of the parasitcal insect introduced by Horticultural Commissioner Schell and Mr. Carnes of the State Insectary at Sacramento. As the crop of this vineyard of Emperors is worth each year about $12,000 it is a considerable matter. The mealy bug was discovered at work in several places, but not as great a number as in this one vineyard of trellised vines. We saw the debris left by the mealy bug, but could find none at work, nor could we find any eggs. One season, as Mr. Schell says, is too short a time to make any definite assertions as to control of this pest. The outlook is certainly a very promising one.

Nature's Way.

The principal objection to the control of one insect pest by its natural enemies is that nature does not recognize any one of them as unworthy of life. She saves them all by never allowing any one to outrun the other. As soon as one family becomes too prosperous, enemies attack it and bring it down to a reasonable number. Increasing the food of any particular insect may for a season increase the insect itself, but by the next season its enemies have felt the increased amount of food provided for them and increase enough to control the surplus. It goes all the way down the line in this way.

Orange Trees.

The mealy bug is at home on the orange and lemon tree. In the town of Fresno they have existed for years without spreading out into the country to do mischief. One gentleman had turned over to Mr. Schell his trees around the house to have spraying tried out as a remedy on them. They had been sprayed to the limit of toleration. There are still a few mealy bugs left, enough to start into active life next year. The trees had been sprayed at an expense much greater than the ordinary vineyardist or orchardist could expect to find profitable to follow up. Then we next visited the tree that was being made a happy home for the predaceous insects. They were busy at work and we could see where they had killed the mealy bugs, but the beetle is too tiny itself to be readily visible to the eye. These mealy bugs were leaving eggs behind them in quantity, so that there is no danger of starvation for the parasites. The carrying over the winter of these tiny strangers is quite a problem, as they come from tropical Mexico, and it is doubtful if they can live through a Fresno winter.

Mildew.

In meeting this trouble we have only to be diligent in the use of spraying. The fact is that the Bordeaux mixture, or lime and sulphur, sprayed on the vines after pruning does control the mildew in a great measure. It does, but it should not,

HORTICULTURAL LAW.

An Address by E. O. Essig Before the Claremont Horticultural Club.

In order to understand the benefits derived from the law of 1910, as well as its defects, it would be well to give first a summary of the new law and the law it replaced. The law of 1907 provided that:

A. Appointment.

The provision for a board of horticultural commissioners consisting of three members, to be brought about as follows:

1. A petition to the County Board of Supervisors, signed by 25 resident fruit growers and possessors of orchards calling for the appointment of such a Board.
2. Supervisors appointed Board after receipt of petition.

B. Removal.

1. First a petition to the Boards of Supervisors signed by 25 resident fruit growers.
2. Removal on hearing and conviction.

C. Duties of Board of Horticultural Commissioners.

1. Cause of inspections to be made.
2. Direct the control and extermination of noxious pests.
3. Keep record of official duties and make official reports.

D. Powers.

1. To divide county into districts.
2. To appoint inspectors in these districts.
3. Force eradication of insect, fungoid, and weed pests.

E. Salaries.

1. For members of Board of Horticultural Commissioners, $4.00 per day.
2. For inspectors, $2.50 per day.

The law of 1910 relating to Horticultural Commissioners provides:

Appointment—First a petition to Supervisors as under old law.

Appointment by Supervisors on following conditions: Applicant must be a resident citizen of the county. Applicant must first be nominated and recommended by the State Board of Horticultural Examiners, which is appointed by the Governor to examine said applicants for the position of horticultural commissioner. This may be accomplished only as follows: Applicant pay a fee of $5.00 to defray part of the expenses of the Examining Board. Appear before a member of the Examining Board and take a written examination. Pass the examination with at least 80 per cent of the questions satisfactorily answered.

Removal, duties and powers same as under old law.

3. Appoint, with consent of Supervisors, two deputy commissioners.

Salaries—For Commissioners, $6 per working day; for Deputy Commissioners, $5; for inspectors, $3.50.

As a working basis for the consideration of the law of 1910, I wish to take up the discussion under the three following main heads, viz.: Good Points, Doubtful Points, and Bad Points.

Good Points.

Without doubt the idea of a single official head to direct the Horticultural work of the county is far ahead of the old Board of Commissioners, in which the power was vested in three members.

It is beneficial to the Commissioner because it individualizes the work and gives him free jurisdiction in all matters pertaining to the work. The responsibility rests upon one man only and it is not necessary for him to consult a co-ordinate in every legal step of his profession. He becomes responsible to the growers alone and does not need to answer for other members of a board. He selects his own deputies, thus avoiding what, under the old law, might prove to be a lack of harmony and united work. The increase in salary is important only in so far as it draws capable men to the field. It is the only thing that will do this.

The inspector is not compelled to cater to the whims of three supervisors and necessarily finds his work more agreeable. Being responsible only to the man who has the power to appoint and remove him, he knows what is required of him. It gives more definiteness to his position. The increase in salary here has also the same desirable effect of drawing more thoroughly equipped men to the work. Some of the inspectors are today men of much higher qualifications than most of the commissioners under the law of 1907.

To benefit the growers was, of course, the desired aim in changing the old law, and all of the above benefits certainly improve conditions for him very directly by drawing more able commissioners to the work. The grower is in a position now to hold the commissioner responsible for the conditions of the county. The burden cannot be shifted to another as has often been the case in the past. In other words, the commissioner may be held responsible by any orchard owner for the specific conditions of his orchard.

The civil service idea of making it necessary for all county horticultural commissioners to satisfactorily pass an official examination is indeed commendable. So long as the entire matter is kept out of politics, the position is sure to be filled by the most efficient applicant. Too much stress cannot be laid upon the matter of getting thoroughly trained men to direct the work which is so important to all lines of agricultural and horticultural interests in this state.

The examining board with its present powers may become a great factor in placing a man in the right place. There are many complex and doubtful problems confronting the growers which may easily be settled by giving them the necessary commissioner, and there is no other method of obtaining this man except upon the proper recommendation of this board. In case one applicant passes the examination at 80 per cent, another at 85 per cent and the third at 95 per cent, there should be no doubt about what is expected from the examining board, when it makes its report to the County Board of Supervisors. There are at present several notorious cases where the best equipped man has been shoved aside to give place to a thoroughly incompetent and inactive applicant, who happened to have a political pull. I believe that the examining board should state all those who passed very impartially, but it should be strong in its statement as to which of the applicants is the most capable for the position in question.

This right, I believe, is specifically stated in the letter of the law.

Doubtful Points.

Most of the points under this heading are placed in the form of questions which are very vital in the workings of the law, and which need to be solved in the near future, if we are to receive the most good from its enforcement.

Concerning the State Board of Horticultural Examiners, should the appointment of this board be so freely placed in the hands of the Governor, without some restrictions? I ask this question because I know of a thoroughly competent man who was endorsed by exchanges and prominent fruit growers from at least one hundred localities. In the face of all these written requests to have this man placed upon the Board of Examiners, the personnel of the board was changed twice and in both cases the choice of so many exchanges and fruit growers was ignored by the one who appointed the members. Now should such a condition exist?

Should there not be a qualification imposed upon the members of this examining board? Should an inspector examine applicants for Commissioner without being qualified by a similar test to do so? What standard is used by the board for determining the questions to be given in each examination? Is there not liable to be a great difference in the various counties requiring practically the same qualifications for commissioners? Is it not possible to adopt a standard to be fixed according to the principal horticultural interests of the state? The questions should be such as are usually given to students in entomology, mycology, botany, and general agriculture at the State University and other similar institutions in the state.

Bad Points.

As to residence qualifications I may say it makes absolutely no difference where a man comes from, or where he has lived prior to becoming commissioner. Ability should be the only qualification. This clause is certainly hard to explain.

As to Deputy Commissioners, this matter was evidently intended to satisfy certain political views and, fortunately has been adopted by only a few counties. Three good commissioners may be able to do a great deal more work than one but the complications would be greater, and the matter of shifting the responsibility and dividing the work would be nearly the same as under the old law. Then, too, it might be possible to force deputies upon the commission through the supervisors as a means of defeating his policies. The domination of deputies and the conflicts with the inspectors are inimical to the best service. Good inspectors with the right kind of direction are sufficient to carry on the work of the largest and most productive counties, without the added expense of deputy commissioners. To my mind these two offices are simply political plums and all County Boards of Supervisors should be informed concerning them.

Regarding Salaries.

The Board of Horticultural Examiners should not be expected to give so largely of their time without an adequate compensation, other than their present traveling expenses. The work is certainly very important and competent men should be sought for the positions and paid accordingly.

The salaries of the Horticultural Commissioner and his inspectors should be placed upon the same basis as those of other county officials, and not constantly subject to the whims of the County Supervisors, who are often inclined to dictate as to the number of days a man may work.

A fixed yearly salary would make the work more desirable and would tend to draw better men to these positions.

Something must be done regarding this phase of the work, for institutions of learning and corporations are paying much larger salaries for men equipped for this work, and these institutions and corporations as well as the Federal work, are getting the best men simply because they are paying more for the service rendered. The importance of the work is without question. Men of ability are not plentiful, so the compensation must be made equal to that paid for similar services elsewhere. We have a number of examples in this state of good men being taken from the state and county work by university experiment stations and general Federal research.

In the administration of the law there are many weaknesses. Under the head of political influence may be placed most of the defects of this law from the time it was first introduced until the present day. The undesirable features spoken of above are simply the results of political jobbery. In the administration of this law, which might have been entirely beneficial, politics wields an influence great enough to completely control the affairs of some of the most important citrus and horticultural districts in the state, by placing incompetent men in the most responsible positions.

The entire influence of politics must be removed from this work, if we are to get beneficial results. Thoroughly equipped men do not need to cater for political pulls, and they will have nothing to do with a work which makes it necessary for them to do so. The need is not for politicians to hold these offices, but for men who know the farm, the orchard, and the means of making them the most productive, and most effectively contributory to the welfare of the state and nation. Such men are not found among politicians.

Surely something can be done to place the horticultural and agricultural work upon a purely civil service basis which may do away with politics for all time. The Federal Department of Agriculture or the state experiment stations cannot be operated on any other basis, so that it would be absurd to think that this could be.

She that will eat her breakfast in bed,
And spend the morn in dressing of her head,
And sit at dinner like a maiden bride,
And talk of nothing all day but of pride;
God in His mercy may do much to save her,
But what a case is he in that shall have her.
—Poor Richard.

The Italian Vineyard Co., near Cucamonga and Ontario, San Bernardino county, estimates a loss of 5,000 tons of grapes because of hot winds of early spring and heavy northers of the last few weeks.

Rex Lime and Sulphur Solution

The Famous Fruit Tree Spray and Animal Dip

This Spray has been sold throughout the United States more than any other spray in use, and the demand for same is constantly increasing.

Peach and plum trees should be sprayed early in the fall as soon as the leaves drop and again in the spring just before the buds open. Also

Rex Arsenate of Lead
and
Rex Sulphide of Arsenic

are supplied by us for all leaf eating insects.

Profitable Farming

Intelligent use of our fertilizers will make your farm profitable. Instead of just about breaking even you will see nice fat profits that you can put away for the days when you will want to rest.

For with fertilizers such as we supply, you will get more per acre no matter what the product and of finer quality. Often you can double the farm's production that way. Let us tell you about it.

Deciduous Tree-Shrub Fruits

A YEAR'S SUCCESS.

The standardization of green deciduous fruits has had its first year's trial. It has not yet placed the market conditions in the perfection class but great good had been accomplished. The meeting to hear reports at the close of the season recently held at Newcastle showed that both growers and shippers realize the advantages gained and are determined to stay by it. Of course a few changes in requirements will be made but on the whole the plan was unanimously endorsed.

The committee on standard consisted of George D. Kellog, chairman; H. E. Butler, first vice-chairman, and W. H. Tudsbury, second vice-chairman; H. H. Bowman, secretary, and Charles Carlston, treasurer. This committee presented a report from which we quote:

Committee Reports.

Proceeding the committee said in its report:

"There being no statutory laws nor any precedents to follow an agreement was drawn up and presented for signatures, which included standardization of fruit as adopted at the mass meeting held in Newcastle, November 22, 1909.

"Our work was organized upon business principles with a check on every financial transaction; proper books, receipts, vouchers and checks were provided. The agreement was presented for signatures and we are pleased to note that every shipping firm doing business in Placer county by their principals and by the manager of each branch house readily signed the same together with several of the prominent growers of the county.

"Placing ourselves under mutual agreement and the moral obligation to stand together was the secret of whatever success that we may have been able to accomplish.

"Inspectors were appointed for the season under agreements to be known as independent inspectors for each shipping district in the county. Their salaries were fixed at $100 a month and they were held to a strict accounting for their services.

"Before the carload shipping season fairly opened the inspectors were sent around to the ranches to advise the growers of the movement and to make them acquainted with the standards that had been adopted for the packing of fruit, and to encourage them in the thinning of fruit wherever it was necessary for the best interests of the crop and when the car shipments began in earnest they were stationed under the direction of the supervisory inspectors, where they should inspect every box of fruit to be shipped.

Funds Were Necessary.

"To provide for these it was necessary to raise a fund which could only come from an assessment on each box of fruit. The authority given by the mass meeting to collect half a cent a box for each package sent in carload shipments was modified by the supervisory inspectors to a quarter of a cent a box.

"As some of the growers hesitated upon signing the agreement on account of the assessment we found ourselves embarrassed, inasmuch as the mass convention had voted that this should be paid by the growers. This difficulty was readily overcome on the part of the fruit shipping houses agreeing to absorb that assessment. This quarter of a cent per box was collected from the several fruit shipping houses upon the basis of June and July shipments, which gave us a sufficient amount of money to carry the work through to the end of the season and by action of the supervisory board our treasurer was instructed not to collect anything further for the months of August, September or October. By this you will see that our entire business has been transacted upon two months' shipment only, and at a quarter of a cent a box in carload interstate shipments, and are glad to report to you a balance on hand of $354.80, which we are ready to turn over to those who provided this fund, and await your instructions as to the distribution of the same.

"In establishing a brand for the standardization of fruit we adopted a uniform brand, signifying that there was not over 72, 84, 76 or 108 peaches in a box.

"To the growers and shippers who signed the agreement to stand by the standardizing rules, and who sustained the movement by their voluntary assessment, we desire to express our heartfelt thanks. The agreement proved to be a mutual and moral obligation resting between us, which proved as strong and effective as any law could possibly have made it, without which the reform undertaken could not possibly have been carried forward.

Changes Advocated.

"The experiences of the season have led us to believe that a state law, similar to some neighboring commonwealths, governing the whole situation would be very beneficial. We invite your discussion upon this point. The rules adopted at our mass meeting, governing the standards of fruit should be revised under the light of the experiences of the past year.

"Among other things a rule should be established that for a two and a quarter-inch peach, for instance, to make a box of 84, that the lower tier should be two and a quarter as well as the upper, but a box not over 72 should have no peach in top or bottom tier that would not come to the two and a half inch measurement. A revision of the plum rules has been found necessary, but on the whole we think that the standardizing rules will pretty generally hold good and correct.

"Receivers of fruit in the Eastern markets have been free in acknowledging an improved pack, which has contributed to better prices and an increased demand for Placer county fruits. Looking forward to a still greater improvement in the year to come, recognizing in our state commissioner of horticulture, J. W. Jeffrey, the party to whom we owe so much for taking the initiative in the standardizing movement, and thanking him for the interest that he has always shown in our supervision, and for his loyal support and wise counsel, we surrender our trust and ask to be relieved of it."

The same committee was appointed for another year.

APPLES INTEMPERANCE CURE.

The forbidden fruit of the Garden of Eden which brought sin into the world is now looked on as the means of driving sin out of the world. No less an august body than the Iowa State Horticultural Society is standing sponsor for the movement to remove the Garden of Eden stigma from the apple, says "Technical World."

When Eve, sorely tempted, partook of the luscious fruit which she had been forbidden to touch, she all unwittingly cast a blight on the apple which centuries of cultivation and two national shows at Spokane have been unable to remove. It has remained for an apple-loving country doctor to discover that not only can the world be fed on apples until it has secured the necessary calories of energy, but that the craving for liquor can be eradicated from the human body by the apples. As if this were not miracle enough, it is contended that General Grant might have won the siege of Vicksburg and the battle of Appomattox by munching on a Ben Davis, a Spitzenberg or a Jonathan, better than by puffing a cigar.

"The use of apples as an article of diet will much diminish, decrease and ultimately abate the appetite for alcoholic stimulants," declares Dr. Samuel Bailey. "That this is a fact could be proved in many instances if a little care, caution and vigilance were taken to thoroughly investigate conditions. As a rule, the habitual user of alcoholic stimulants is rarely a lover or consumer of apples. There seems to be a peculiar combination in apples, in the acid in them, or in the peculiar chemical combinations of the apple, that allays the irritation, or so-called appetite, produced by the use of liquor. I am also of the opinion that the keen appetite for tobacco is limited by the use of apples. I am thoroughly convinced that any man who is a lover of whisky and is in a condition where he thinks he must have a drink, will find that his appetite for the drink has been materially lessened, if not entirely abated for the time."—Green's Fruitgrower.

BARN-YARD MANURE.

Barn-yard manure increases the water-holding capacity of the soil; and instead of dumping the manure in some convenient, out-of-the-way place, or leaving in the yard to deteriorate, or to rot the structures against which it is so frequently piled, the farmer can not only save money, but at the same time conserve the moisture of his soil, by immediately spreading it upon his fields To get manure onto the fields quickly and effectively a manure spreader is very useful. Such implements are in daily use at University Farm.

Without moisture, fertility is of little consequence; and moisture without fertility will not produce satisfactory results. The soil must be supplied with organic matter to replace the plant food extracted from it by growing crops. This must come largely from the barn-yard; from plowing under the green weeds, etc. Without paying attention to modern methods of agriculture our Minnesota farmers will soon be complaining of wornout soil; the value of the land will drop, and the young men will look for a better chance elsewhere.—Minnesota University News.

Manure from the barn-yard adds humus to the soil; and humus acts like a sponge; retaining moisture in the soil, making it more capable of absorbing a heavy rainfall and of holding it there longer. The moral, therefore, is to save and carefully spread all barn-yard manure over the fields. Manure is worth dollars, and will put dollars into the farmers' pockets.

The texture of the orchard soil, no matter whether it be clay, sand or humus, may be greatly changed by correct cultivation.

APPLE CULLS.

There are just four places to put the small and defective apples—make them into cider, feed them to the hogs, box them by themselves and sell them for what they will bring or try and work them off in the middle of a box of good fruit.

Most fruit men try their hand at the last method first and lose their reputation for honesty and good money besides. This petty and always unprofitable fraud belongs with the watering of milk taken to the creamery, the putting of tailings in the middle of the wheat sack and the filing off of the old rooster's spurs to try and pass him off for a spring chicken.—Western Farmer.

The same sun, rain and dew falls upon the orchard of Mr. Careful as upon that of Mr. Slack, but Mr. Slack gets few marketable fruits. More depends on man and methods than upon Maine or Montana.—Farm Journal, And we may add even California.

SUMMER COVER CROP.

I was much interested in Mr. Prizer's article of last week, regarding orchard management. Mr. Prizer is a bright, energetic young man and a capital observer, as your readers have reason to know. He is taking great interest in cultural methods and will be more and more in evidence.

There are two suggestions in his article on which I wish to comment. He urges very wisely, as I did at the Pomona meeting, that tillage be carried close up to the trees, but says do it with a mattock. I know of large orchards where this is done, but I wonder if it would not be wiser to follow the course of Mr. C. C. Chapman and trim up so as to cultivate close up to the trees. This would be much cheaper, and then the cultivation would be not once in the year but at every cultivation. This is Mr. Hubbard's practice at San Fernando, and his trees say say "Thank you!" with emphasis.

Again, as to cow peas as the summer cover crop. It is hardly safe in this country to suggest summer cover crops without an emphatic word on the importance of much water. The crop and the trees will both call loudly for water, and unless the orchardist has it in quantity and will use it, without fail, he must never grow a summer cover crop.

The alfalfa in the orchard and a good crop of cow peas are all right, if water can be given in quantity. Else we must only grow winter cover crops. The trees must have all the water they need.

About Claremont the past season there has been unusual difficulty in getting the water to the roots, especially in late irrigations.

This "irrigation hard-pan" has held the water from the roots. Mr. Prizer's contention that this must be kept away by deep, early cultivation is most timely. A. J. COOK.

MENDOCINO COUNTY.

By N. E. Luce.

While touring the northern coast counties one must not forget the fact that Mendocino county is worthy a careful look, as to its agricultural and fruit growing adaptability. While the area of tillable land at present is limited, it is being added to each year and especially for the growing of fruits.

The valley surrounding Ukiah, as its centre is nearly twenty miles in length and from two to five miles in breadth. The bottom lands in this valley are rich, a dark loam soil and very productive. These lands are given over to hop growing, general farming and dairying. The foothill lands are adapted to fruits and walnuts, also vineyards which produce a very fine grape, extremely rich in sugar. Splendid apples are grown in the mountains, although in limited quantity.

Many new people are coming into this section and there is a spirit of progression taking hold of the ranchers that will work for the betterment of the county at large.

The valley around Willits is not as large as the one first mentioned, but contains a large area of good land, a great deal of which is under a good state of cultivation. I did not see the coast country but from best information there is quite a large amount of good agricultural and fruit land on the coast north of Fort Bragg, which on the completion of the railroad now under construction from Willits will be developed rapidly. In the north end of the county are many fine valleys of rich bottom land.

Round Valley is in the track of the railroad now being constructed to Eureka from Willits. This valley is partly occupied by the Indian Reservation. Then there is the Laytonville valley where there is a fine lot of land. Splendid fruit is raised in this section. Mr. Bowman has a three acre orchard whch produces apples that are as good as any I have seen, fruit the writer saw was very fine, color all that could be desired, texture of flesh and quality perfect, size and shape that makes a fruit that would score 100 at a Watsonville annual.

Transportation has been the drawback here and with the completion of the new railroad Mendocino county will rapidly come to the front as one of our best apple producing counties.

Stock raising is a very large industry here and I have seen sheep ranches with 5000 head of sheep, also large hog and cattle ranches. One condition I was sorry to see was the small attention paid to their roads and like some other sections the gospel of good roads ought to be forced home to them in a manner that would show them the value of having a system of first class highways.

The Pacific Fruit Auction Company has been formed in Los Angeles. Its mission is to be the handling of oranges and other fruits through the auction system.

WRITE FOR CATALOGUE AND PRICES

Trees: Book orders now for the following standards.

Peaches: Tuscan, Orange, Phillips, Levi, Foster, Triumph, St. John, Early Crawford, Elberta, Muir, Lovell, Fay-Elberta, and Salway.

Peaches have paid growers more profits in the last 25 years than any other fruit.

Apples: Alexander, Red Astrachan, Gravenstein, White Astrachan, Jonathan, Rome Beauty, Spitzenburg, Bellflower, Newton Pippin, Grimes Golden Pippin, Ortley, McIntosh Red, Winesap, Wagner, Winter Banana, Arkansas Black and many others.

Get in your orders now for Gravenstein, Jonathan, Spitzenburg, Yellow Newton Pippin, White and Red Astrachan, Alexander. They always sell out first.

Cherries: Black Tartarian, Bing, Black Oregon, Black Republican, Royal Ann, Lambert.

Cherries are great money makers. The above varieties always sell out early.

Also all standard varieties of

Plums, Prunes, Apricots, Almonds, Pears, Quinces, Persimmons, Figs, Oranges, Lemons, Etc.

Our trees are selected, thrifty, well-rooted and true to name.

The Ornamental Garden

THIS MONTH.

Watsonias which were planted early and are now coming through the soil or perhaps well up may be greatly benefited by a deep mulch of coarse manure, and the same is true of gladiolus which were ripened off early and planted for Winter bloom. In fact, this is a good season to apply mulch to any bulbs or plants. Even a Bermuda grass lawn is helped by a good application of manure now. We noted a few days ago a Bermuda grass lawn which last month was given a good application of commercial fertilizer and is now as green as blue grass. We recently noted in a Texas paper full instructions for the establishing of a Bermuda grass lawn. Should we give the Bermuda the same care we give to blue grass and clover we might have a beautiful green lawn most of the year. The Californian is often wild at the prospect of Bermuda taking possession of his lawn, but unless he gives it the best of attention and constant care he may as well wish for the Bermuda and enjoy it when it comes. However, where one prefers blue grass, this is the season for planting.

Pansies, stocks and such Dutch bulbs as have not already been planted may still be put out. Deciduous shrubs and ornamental trees may be planted during this and the next two months.

Eucalyptus trees may be pricked out of seed beds or flats and put into cans or larger flats.

Setting out of deciduous plants will also soon be in order. If leaves are all off the pruning may be done at once. Chrysanthemums which have finished flowering may be taken up and the beds given to other plants, and if the plants taken out are heeled in they will send out a quantity of shoots in the spring which may be reset for next year's blooming.

As soon as the cool weather has made them dormant, rose cuttings may be taken from the choicest plants. If placed in a slightly slanting position in sand and where the warmth of the sun has full effect they will soon granulate and be ready for rooting within a few weeks. Then they may be put into good rich soil and abundance of blooms secured even the first season. Roses are grown so readily in California that there is no excuse for not having millions of them.

WISTARIAS NOT FLOWERING.

More than one correspondent has written me this spring of the failure of their wistarias to flower, one of whom says her vine has been planted five years and has borne no flowers yet, and says she is prepared to root it out. To do this would be a mistake, for it is well known to gardeners that this vine takes a long time to reach a flowering age. In my own case I have now, close to my door, and in view as I write, one of the Chinese wistarias which has been planted six years, and which was two years old when set, and it has never bloomed yet. One of those who wrote me said she had been told that neither the wistaria nor the trumpet vine would flower when raised from seeds, and desired to know if this was so, as if true it might be the reason her wistaria had not shown flowers. Replying to the seedling matter first, there is no truth in the saying that seedlings will not flower at all. It is likely that they do not bloom so soon as those raised from cuttings or in other ways than from seeds, for all experience proves that seedlings take longer time, the reason being that they have more vigor, and the more vigorous the growth of a plant the more prolonged is the period before flowering.

Wistarias have always been known as demanding several years of strong, vigorous growth before they bloom. I rather looked for my own plant to flower this spring, but it did not, though it has reached the top of a dead tree, but the shoots are all long, thin ones, and not the short, woody ones that flower. Many are disappointed in having to wait so long for this vine to flower, but they are rewarded in the end, for when it commences it never fails to flower every year; and almost everyone knows of the beauty and fragrance of its racemes of purplish blue flowers, referring to the Chinese species, Wistaria sinensis, which is the one most everyone means when speaking of wistaria.

By wistaria everyone, almost, means the Chinese, but there are other kinds, one a Japanese species; another a native of our own country, and hybrid kinds besides, but none equal the Chinese in beauty. It is worth waiting for some years to get at last such a lovely vine in flower.—Jos. Meechan in Practical Farmer.

SOMETHING OF BEAUTY.

As well as of order, convenience and good sanitary conditions—is needed to make a farm home attractive. In planning such a home, let not this be forgotten. A wide sweep of lawn between the house and the road; a background of trees and shrubbery; low flowering bushes planted close to the foundation and serving, as it were, to bind the house to the soil; vines over the porch or bordering the window-frames—all these do much to beautify the house. From the erection of the first house, however modest, the home-maker should plan for the future as well as for today. He should avoid building too near the road; remembering that prosperity may ere long enable him to build a larger home, which may often be most satisfactorily placed in front of the old one. Barns and other buildings should be located in such relation to one another as to allow for improvements which will result in a harmonious whole.—Minnesota University Farm News.

THE RETORT COURTEOUS.

An old darky wanted to join a fashionable city church, and the minister, knowing it was hardly the thing to do and not wanting to hurt his feelings, told him to go home and pray over it. In a few days the old darky came back. "Well, what do you think of it by this time?" asked the preacher. "Well, sah," replied the colored man. "Ah prayed an' prayed an' de good Lawd, he says to me, 'Rastus, Ah wouldn't bodder mah haid about dat no mo. Ah've ben trying to git into dat chu'ch mahse'f for de las' 20 years and Ah ain't done had no luck."
—Christian Register.

Garden and Field Crops

THIS MONTH.

Hardy vegetables, such as beets, carrots, cabbage, cauliflower, lettuce, parsnips, parsley, salsify, turnips, radishes, peas, roots of asparagus, rhubarb and strawberries, may be planted. For some frostless sections hotbed plantings of tomatoes, peppers and eggplant seed may be made. Portions of the garden which will not be planted for a few weeks or months may be heavily fertilized with stable manure, which should be spaded or plowed under. It is almost impossible to get the vegetable garden too rich, and the abundance of humus carried in stable manure makes it one of the most valuable of fertilizers.

THE HOTBED.

To prepare a hotbed, make a frame or box the size desired for it. The size varies, but the usual size is from 4½ feet to 6 feet wide and as long as desired. It is not a good idea to make the hotbed too wide because it prevents the grower from easily reaching the center of the bed when weeding it. The frame can be made out of common one by six inch lumber, but heavier material may be used if desired. After sawing off the pieces for the four sides nail them together at the corners. Place this box over the place marked for the hotbed. At each corner and in the center of each piece, on the outside of the frame sink or drive into the ground a two by four stake thirty inches long. Nail the hotbed box to these stakes. The box so secured to the stakes will not spread or slip up or down.

When the frame has been prepared as above dig out the soil inside of it to a depth of twenty-four inches. While digging out this pit it is a good plan to make it a little larger at the bottom than the frame above, so the heating material when placed in the pit will be under the whole surface of the area inside the frame.

Into this pit place the heating material from sixteen to twenty inches deep. Care should be taken to tramp the manure down firmly and evenly so as to make the mass compact and smooth on top. On top of this put five or six inches of rich well crumbled loamy soil. After the temperature of the soil has become somewhat uniform the seed may be planted. After planting the seed, care should be taken to see that the soil does not become dry, because if it does the young plants will likely be killed. The heating of the manure below causes the water to evaporate rapidly from the soil. This being the case it is important to apply more water than ordinarily required in an outside bed. Probably more failures are caused in growing plants in the hotbed by injudicious and improper watering than from any other cause.

In regard to the kind of material to use for heating, fresh horse manure is probably the best. In preparing the manure for the hotbed, secure the amount needed for it and place the same in a pile. When piling it up put on enough water to thoroughly moisten the whole mass. If fermentation does not commence soon it can be hastened by throwing on the pile a few pailfuls of hot water. When the manure has begun to heat well turn over the whole mass into a new pile. This will make the heating of the whole more uniform. If necessary add more water. The fermenting manure should not be allowed to become dry nor should it be made too wet. After the heating has become somewhat uniform the manure can be put into the hotbed pit as described above. If the manure used is very fine and does not contain much straw or other litter, it is better to add some straw or other coarse material. This helps to make the heating more uniform and prevents too rapid fermentation of the manure thus causing the heat to last longer.

The kind of covering to use for the hotbed depends on the material at hand. The regular cold frame sash may be used. The size most common in use is the three by six foot sash. The cold frame in connection with the manure furnishes abundant heat. Where the cold frame sash is not available, covering the bed with common muslin or white domestic gives very satisfactory results. It lets in sufficient light and holds the heat to some extent from passing off too rapidly. The muslin may be stretched over the whole hotbed in one piece, or small frames may be made the width of the cloth and size of the frame to which the cloth may be tacked. These frames can be made out of light lumber. Strips two inches wide by one inch thick will be sufficiently heavy. The frames may be mortised at the corners and nailed together, or small strap angle irons like those used on the bodies of carriages can be screwed on each corner which will hold the frames firmly. On very warm days the frames may be raised to let out some of the excessive heat and more light in.—New Mexico Agricultural College.

VEGETABLES ON AN ACRE OF LAND.

With land in the proper condition, an authority says a good farmer can raise on one acre any one of the following:

One acre of onions, 445 to 600 bushels.

Tomatoes, 300 to 400 bushels.

Sweet potatoes, 500 to 600 bushels.

Beets, 300 to 400 bushels.

Carrots, 300 to 400 bushels.

Cabbage, 8000 heads.

Potatoes, 100 to 300 bushels.

Here are actual results, each item referring to the product of an acre where the grower was a specialist:

Asparagus, 300 bunches, 20 cents a bunch, $600.

Cauliflower, 100 to 300 pounds, $450.

Onions, 600 bushels, 75 cents, $450.

Cabbage seed, 1000 pounds, 40 cents a pound, $400.

Potatoes, 175 bushels, low estimate, $175.

Cabbage, 7000 heads, $500.

To be a successful trucker, have a continuous succession of crops, and maintain and increase the land's productivity year after year.

Potatoes, unlike onions, should not be allowed to sun after they are dug. Pick them up and place in bags as soon as they are out of the ground to prevent the sun from striking them to injure the skin and to cause them to shrink.

Onions

from Morse's Seed

Success in onion planting depends on your having ***good seed.*** Morse Onion Seed can always be depended on; we are proud of them; they are grown, gathered and selected under our personal supervision. We ***know*** they're right and will produce the crops, because we grow and sell more onion seed than any other concern in the world.

We recommend the following varieties for fall planting. They can be transplanted in February and will be ready for market in early May.

Australian Brown; early and very hardy; the best long keeping onion ....per pound, **$1.00**
California Early Red; a mild flavored onion, very popular as green onion ....per pound, **$1.00**
Prize Taker; a large globe shaped onion; a very heavy cropper ....per pound, **$1.50**
Yellow Globe; the popular yellow globe onion; heavy cropper and good, firm, hard fleshed, per pound, **$1.25**

I've Proved Just What You Want to Know

What Prompted the Test Millions of people buy buggies yearly, believing them to be the most economical form of transportation. Thousands of farmers, merchants and professional men wrote me during the past year, saying "they would gladly purchase an automobile if they only knew it would serve their needs as economically as their horse and buggy."

I knew the Maxwell Model Q-11 Runabout, in its present state of perfection, could do three times as much work at half the cost and one-fourth the trouble, and decided to make a public test to prove it.

I Invited the Contest Board of the American Automobile Association to conduct this test, in order that it might be in disinterested control. The Board appointed judges to attest its results. The two vehicles ran each day over a predetermined route about the streets of New York City and suburbs. Each ran continuously for six hours, regarded as a normal day's work. Account was kept of every item of expense entailed. The needs of each vehicle were supplied at roadside stores at current market prices.

Each Day a Different Route was laid out, in order to cover all conditions of city and suburban traffic and all sorts of roads. One day they covered the densely congested districts of the city; another day they ran in infrequently traveled suburban roads. Everything was done to make the test normal, actual, eminently fair and conclusive, and the results confirm our claim that **Maxwell automobiles are cheaper to use than a horse and buggy.**

SALE OF MAXWELLS TO DATE

Sold to Sept. 30, 1910	37,389
Sold during Oct., 1910	1,767
Maxwells in use today	39,156

WATCH THE FIGURES GROW

What It Means to You The Maxwell automobile means new life on the farm, happier and healthier conditions, better schooling for the children, by enabling them to attend town schools. Easy shopping for the wife. Quicker errands about the farm and increased knowledge of business conditions in your section of the country. It will, if properly employed, increase your earning power, save your time, extend your field of action and keep the boys on the farm by its money-making possibilities. It is always ready, sanitary, and cannot be overworked.

It Proved Beyond Dispute That the Maxwell Runabout is undoubtedly economical; that its pleasures are within the reach of men of moderate means; that it can travel three times as far, in the same time, as the horse and buggy, and, unlike the latter, can repeat the performance if found necessary; that its cost is about one-half; that it needs little or no care, as against constant care, and that while not in use expenses stop, while with the horse and buggy expenses never stop; that the Maxwell car is an efficient, economical, reliable, utility automobile, as near perfection as modern workmanship can make it.

These Books Free I want you to know more about this test. Let me send you all the evidence, also our latest catalogue and Farmers' Economy Booklet. I will gladly send you these books free, and the sending places you under no obligation. A postal will do. Just say, *"Mail Books."*

Live Stock and Dairy

Dairymen and stockmen are requestd to write of their experience. Mrs. herman is always willing to answer ueries and this, with experience of ther workers, will make this departnent of greater value.

NEIGHBORS.

By Mrs. M. E. Sherman.

Election times brought the neighbors close together for the big autos of the candidates were giving everyone free lifts along the way to the next farms. I have seen more of the men on the nearby farms in this past month than since last election time. The past couple of weeks have been filled with Institute work and these visits to neighboring towns have shown us how great was the interest in alfalfa, in cows, and in the homely pigs. The farmer is growing tired of raisins and dried fruit—as the crop is handled year after year to his loss.

Vineyards.

If it were not for the unfatigued ew comer, filled with the real estate nen's stories, I do not believe the market would find an increasing supply of peaches, raisin or wine grapes. The seeding combination, the wine association—and the canning companies have about killed all desire on the part of any one to plant orchards and vineyards. It seems a pity that a trial of parcels post cannot at this time be made for the benefit of the raisin and dried fruit growers. If these articles could be sent directly from the farm to the consumers at a low rate of postage it would make them cheaper to the consumer. The use of raisins for stock feed is growing constantly and this will take them up largely when not of the highest quality. The profit on feeding raisins to hogs is about this at present time: three pounds of raisins will make a pound of fat hog. If this is worth ten cents a pound, then the raisins are worth three and a quarter cents a pound for hogs. If two pounds of raisins are fed with one pound of rolled barley and five pounds of chopped alfalfa hay the hogs will put on about two to two and a half pounds of meat.

Jersey-Durocs.

In the way of pigs, the best I have seen lately are three Jersey-Durocs brought from Illinois. The sows were as fine as anything I have seen in a long time. I often wonder why it is that we see in the sows that come here from the East much higher quality than in the male pigs, I rarely see in the males the perfection that the type calls for in a breeding animal. This breeder had an interesting lot of young white sows entirely free from any traces of skin troubles. They were the offspring of a white sow of unknown breeding that had always had a clean healthy skin. It may be that as the country advances and the pigs are kept as domestic nimals, and not turned out to rustle, that many of the troubles of the white hogs will pass away. At another institute a man reported investing in registered white swine believing he could do well with them out here. I am always glad to see these newer breeds being tried out. There are also several breeders about to start in with the mule-footed hog.

Profits.

Everywhere the people are saying pigs are more profitable than grapes when a man has a good alfalfa field to feed them on. The tendency is to carry the pigs up to full weight by feeding rolled barley and Egyptian corn as a supplement to dried fruit and grapes. Profits are different often on the adjoining farms. Down in the next county I was interested in one man's story of having a forty acre piece of alfalfa stocked with four hundred head of hogs and finding it ample feed for them, when a little sown barley was grazed off during January and February.

Lice.

Everywhere I noticed the work of lice; even at a county fair I noticed that some pigs were lousy. This is unnecessary and rather useless to feed lice on good rations of hog meat. The lice may be held readily under control during the summer time by putting into the wallows of the pigs a couple of gallons of crude oil. This should be renewed every two or three weeks to keep up the supply. The wallow is necessary if the hogs are to escape the effect of heat during the summer time. A dipping vat on a ranch is, of course, excellent to have but it is rather expensive as it should be arranged with some means for heating the water. Where the Texas fever tick is found it is the only possible way of handling cattle, but the pig can be trusted to wallow whenever he is given the opportunity.

Dips.

The commercial dips are many of them good and if the animals are completely soaked they will destroy the lice. Two or three applications are necessary to completely destroy the lice as they hatch for the eggs are well protected. This is the reason why it is so much more likely to be effective if the crude oil is used in the wallow than to attempt to spray, for the pig has abundant time to take care of the lice. The colts and calves are readily treated with kerosene emulsion applied with a mop or spray pump quite warm. For summer use it may not be necessary to heat the emulsion, still we have better results if it goes on at blood heat. This is easily explained in the fact that it penetrates the hair better when it is warmed and the animals stand more quietly.

Kerosene Emulsion.

The pig scalding vat is used to make the emulsion in quantity as it is useful to have on hand. The chicken house may need a spraying with it at any time. Take ten pounds of hard yellow laundry soap, chop it up and put it into the kettle. If the water, about twenty gallons, is boiling in the kettle and the soap dropped into it a little at a time, in ten minutes it will all be well dissolved. Have two ordinary sized barrels and put into each of them twenty gallons of a cheap grade of kerosene oil. Pour one-half of soap mixture into one barrel and mix it by beating it well until it is a complete emulsion. Then pour the rest into the other barrel and repeat this. This is the stock solution and when it is used put one gallon to seven of hot water and apply to the animals with either

a mop or brush, or spray it on. This emulsion is harmless to the stock and should be kept in quantity on every farm. The dogs are greatly relieved from fleas if they are dipped into this solution once a week during the summer. A couple of dogs running around will pick up lice and ticks as well as fleas and by destroying them weekly it helps to clean up the pests. The kerosene emulsion and Bordeaux mixture are two of the greatest friends of the farm; one to control the mildews and smuts of vines and cereals and the other to control the lice, mites and small insect foes of the farm animals.—M. E. Sherman.

A NEW GERMICIDE.

Great hopes are felt for the possibility of stamping out hog cholera, gid in sheep, hoof and lip diseases with which stock raisers have to contend.

Tests which have been made with the wonderful new University of Minnesota chemical discovery known as Benetol, show that there is every reason to believe that this chemical will be the one thing that has been needed to make stock raising more certain, and at least free from scourges which carry off whole colonies of stock in a short time.

Prof. H. C. Carel, of the University of Minnesota, as has already been made public quite generally through the press, has discovered one of the most powerful of germicides, and the first of all, to be non-poisonous, chemically. The poisonous quality of Benetol has been found to be about that of common table salt. It can therefore be given in large doses internally to human beings, and hence, it follows, in large quantities to animals in the same way. Tests on horses show that ounce doses in capsule are easily assimilated, with germ killing results.

In order to have a perfect test made, that can be bulletined to the stock raisers of the country, several experimental stations have been sent quantities of Benetol, with which to make the test. The Minnesota station will probably complete its tests first. They will consist in giving infected hogs internal doses, and sprays. In the dread sheep disease, in which the worms enter the brain, the plan is to inject different quantities of Benetol under the skull where it will be absorbed by the brain. Chemists assert that if the chemical can be sent to the seat of the trouble, it will kill the germs in a very short time, soon enough to save the animal.

Prof. Carel states that he will send a desired quantity to any station that has not already secured it, for the purpose of making any tests they may desire. He says it will be beneficial for spraying fruits because of its great germ killing powers, and the fact that it is not a poison, which will allow its use at any stage of the development of the fruit. He says it will surely kill all fungus germs.

The department of the interior is testing Benetol on several Indian reservations, and several have pronounced it a success, and is doing the same thing at army posts. The navy has already pronounced it a success, and is using it at the Marine Hospital at New York. The Baltimore water board is testing Benetol with a view to using it to purify the water supply of Baltimore.

FEDERAL STANDARDS.

Milk is the fresh, clean lacteal secretion obtained by the complete milking of one or more healthy cows, properly fed and kept, excluding that obtained within fifteen days before and ten days after calving, and contains not less than eight and one-half (8.5) per cent. of solids not fat, and not less than three and one-quarter (3.25) per cent. of milk fat.

Blended milk is milk modified in its composition so as to have a definite and stated percentage of one or more of its constituents.

Skimmilk is milk from which a part or all of the cream has been removed, and contains not less than nine and one-quarter (9.25) per cent. of milk solids.

Pasteurized milk is milk that has been heated below boiling sufficiently to kill most of the active organisms present and immediately cooled to 50 degrees Fahrenheit or lower.

Sterilized milk is milk that has been heated at the temperature of boiling water or higher for a length of time sufficient to kill all organisms present.

Condensed milk, evaporated milk, is milk from which a considerable portion of water has been evaporated and contains not less than twenty-eight (28) per cent. of milk solids of which not less than twenty-seven and five-tenths (27.5) per cent, is milk fat.

Sweetened condensed milk is milk from which. a considerable portion of water has been evaporated and to which sugar (sucrose) has been added, and contains not less than twenty-eight (28) per cent. of milk solids, of which not less than twenty-seven and five-tenths (27.5) per cent. is milk fat.

Condensed skimmilk is skimmilk from which a considerable portion of water has been evaporated.

Buttermilk is the product that remains when butter is removed from milk or cream in the process of churning.

Goat's milk, ewe's milk, et cetera, are the fresh, clean lacteal secretions, free from colostrum, obtained by the complete milking of healthy animals, other than cows, properly fed and kept, and conform in name to the species of animals from which they are obtained.

Cream.

Cream is that portion of milk, rich in milk fat, which rises to the surface of milk on standing, or is separated from it by centrifugal force, is fresh and clean and contains not less than eighteen per cent of milk fat.

Evaporated cream, clotted cream, is cream from which a considerable portion of water .has been evaporated.

Milk Fat or Butterfat.

Milk fat, butterfat, is the fat of milk and has a Reichert Meissel number not less than 24 and a specific gravity not less than 0.905.

Butter.

Butter is the clean, non-rancid product made by gathering in any manner the fat or fresh or ripened milk or cream into a mass, which also contains a small portion of the other milk constituents, with or without salt, and contains not less than eighty-two and five tenths (82.5) per cent. of milk fat. By acts of Congress, approved August 2,

1886, and May 9, 1902, butter may also contain added coloring matter.

Renovated butter, process butter, is the product made by melting butter and reworking, without the addition or use of chemicals or any substances except milk, cream or salt, and contains not more than sixteen (16) per cent of water and at least eighty-two and five-tenths (82.5) per cent of milk fat.

Cheese.

Cheese is the sound, solid and ripened product made from milk or cream by coagulating the casein thereof with rennet or lactic acid, with or without the addition of ripening ferments and seasoning, and contains, in the water-free substance, not less than fifty (50) per cent of milk fat. By act of Congress, approved June 6, 1906, cheese may also contain added coloring matter.

Skimmilk cheese is the sound, solid and ripened product, made from skimmilk by coagulating the casein thereof with rennet or lactic acid, with or without the adition of ripening ferments and seasoning.

Goat's milk cheese, ewe's milk cheese, et cetera, are the sound, ripened products made from the milks of animals specified, by coagulating the casein thereof with rennet or lactic acid, with or without the addition of ripening ferments and seasoning.

Ice Creams.

Ice cream is a frozen product made from cream and sugar, with or without a natural flavoring, and contains not less than 14 per cent of milk fats.

Fruit ice cream is a frozen product made from cream, sugar and sound, clean, mature fruits, and contains not less than 12 per cent. of milk fat.

Nut ice cream is a frozen product made from cream, sugar and sound, non-rancid nuts, and contains not less than 12 per cent of milk fat.

Miscellaneous Milk Products.

Whey is the product remaining after the removal of fat and casein from milk in the process of cheese-making.

Kumiss is the product made by the alcoholic fermentation of mare's or cow's milk.—Hoard's Dairyman.

WHERE THE HOG EXCELS OTHER ANIMALS.

Now let us figure a little. One good sow will raise two broods of eight each, or 16 pigs each year. Ten sows should raise 160 pigs. Counting 125 for sale, balance for loss and family use, one pound per day as gain for 200 days, you will then have 125 hogs averaging 200 pounds, 25,000 pounds gross, at eight cents per pound which would bring $2,000. The market will go lower on hogs, but you can surely buy good land at $20 per acre, or $800, so you will have left $1200 as expense item, feed, interest on money, cost of crops.

One word as to shelter.

In the northern states we keep stoves in the breeding houses. In southern Illinois a December pig is considered worthless. Many die in February and March. April and September are the best months for sows to farrow. You of this land of golden opportunities can have the sows to farrow any month in the year. I would not advise the hottest.

The hog is the cleanest animal on the farm; will make his own bed, take a bath several times a day, more than most of us do; does not need grooming; does not lie down in filth unless compelled to. Now listen, if you will not provide cool shade and plenty of water, your name will not be Mr. Farmer; it will be Mr. Dennis.—Farm and Ranch.

HOW TO DOCK SHEEP.

Methods employed in cutting the tails from sheep in the division of animal husbandry at university farm, St. Paul, are first to place the lamb on its back, pushing the skin of the tail back toward the body as far as possible, so that enough skin will remain to cover the stump of the bone when the tail is cut off. In operating on lambs several months old, draw the skin back closely to the body and tie a ligature around the stub of the tail until an hour or two afterward, to prevent excessive bleeding. Place the lambs in a clean pen bedded with clean straw. Cleanliness prevents infection, and in such an inclosure bleeding can be detected. Rams should be castrated at time of docking, while in the hands of the operator, if proper physical development of the organ has been reached. This condition occurs about ten days after birth.

PERCHERON SOCIETY OF AMERICA.

The Percheron Society of America, of which Wayne Dinsmore is president, with office at the Union Stock Yards, Chicago, is making an effort to clean up and complete its record prior to January 1st. The following circular explains itself:

The opportunity to re-record purebred Percherons, not already properly recorded in the Percheron Stud Book of America will soon be past. January 1st, 1911, is the time limit set by the board. Before this date, American bred mares, now recorded in other associations recognized by the Government, may be re-recorded for $2 per head, if eligible; imported mares at $5 per head. After January 1st, the charges are $100 per head for re-recording imported animals and will be strongly advanced on American breeds. This liberal offer is made to permit breeders to straighten out their stock, and every breeder should act at once, if he has any animals affected.

The Percheron Society of America is the only organization possessing the original records. It represents fully 95 per cent of all Percheron breeders in America. Every one of the 3,000 shares of capital stock has been taken, and numerous applications for stock are now on file, awaiting an increase in capital stock. Almost 3,000 Percheron breeders are members of the Percheron Society, nearly all the stock being held in single shares by individual breeders.

Seven hundred and ninety-four new members have been added to the Percheron Society of America between December 1st, 1909, and November 1st, 1910; 360 of these have been added between August 1st and November 1st.

No animals are recorded in the Percheron Stud Book of America unless sire and dam are recorded. If your stock is not properly recorded in the Percheron Society of America, write to the secretary at once and straighten up your stock while you have the chance. Don't buy or breed to a Percheron stallion unless the owner produces a certificate from the Percheron Society of America. By taking this course you are safe. The chances are that a horse lackng such a certificate is not eligible. It costs you nothing to require the papers before doing business, and may save you much grief and expense at a later date.

ADDS INTEREST, ATTRACTS BOYS.

More and better live stock adds interest to farm life and attracts our brightest young men and women. A general abandonment of live stock would greatly increase the tendency of young people to leave the farm. Agriculture without live stock tends toward a relatively ignorant class, not farmers from choice, but for the paying labor, as in factory, shop or mine. We ought to work out and establish tenant systems which would encourage live stock.—The Grange.

COLTS NEED EXERCISE.

Growing colts should always have a smooth, roomy lot in which to exercise, and should be given the run of this enclosure summer and winter. Plenty of exercise and fresh air and sunshine are essential to the best development of any animal. This does not mean that they should be left unprotected during the cold winter nights. They should either have free access to a warm shed or, better still, be tied up nightly in stalls. The handling of the colt cannot begin too early.—New England Farmer.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los

A GREAT DAIRY CENTER

Where every Condition makes for the Greatest Yield of Butter Fat at the Lowest Cost

THE SACRAMENTO VALLEY IRRIGATION COMPANY

Exceptional Value
Price:
$125.00
Per Acre

Has started a big dairy movement in **Glenn and Colusa Counties:** Dairymen from all over the United States are interesting themselves in these lands, where alfalfa produces 7 to 12 tons per acre, and silage corn from 25 to 30 tons. In fact, all crops grown in California make big yields in the **Sacramento Valley.** Oranges, walnuts, almonds, peaches, prunes, grapes, and fruits of all kinds yield in the greatest abundance.

☞ Write at once for new **Dairy Literature.**

Unequalled Opportunity
The Terms $15.00 Per Acre
Cash, the balance in 10 ANNUAL INSTALLMENTS.

The Big Tulare Citrus Fair

The readers of the Cultivator will be glad to learn that the outlook for a big citrus fair at Visalia from December 5 to 10 is unusually promising, and will undoubtedly be the star attraction in Central California for 1910. The Tulare Annual Citrus Fair has become a fixed annual feature for that region, growing in importance and popularity with the succeeding years. This year the people of the San Joaquin valley are a unit in their endeavors to give it state-wide significance. To attain this realization the commercial interests of Visalia, coupled with a liberal county support, are showing an initiative and developing energy that is as gratifying as it is glorious. It makes me think of the palmy days of citrus fairs in Los Angeles.

The coming array of citrus fruits is to be housed in a handsome new pavilion 100x300 feet, every foot of floor space of which has been taken, the major portion by locality exhibits from Dinuba, Orosi, Three Rivers, Lemon Cove, Exeter, Lindsay, Strathmore, Porterville, Tulare and Visalia, besides the numerous individual exhibits. As auxiliary attractions the Golden Gate Park band of San Francisco will give concerts during the entire week; the La Fiesta Carnival Company will add to the interest in the function; the decorations and lighting of both the city of Visalia and the pavilion proper are to be carried out on an elaborate scale; all railroads will run special trains from all valley points, and reduced rates are assured from as far north as Sacramento and as far south as San Diego; special excursions will also run from San Francisco and Los Angeles.

Enterprise like this is deserving of recognition, and we hope to meet many of The Cultivator's thousands of readers from all over the State at Visalia December 5-10.

Economic horticulture will be on dress parade, and all who can should see the show. Tulare county has the goods, as shown by the following soil figures: Twenty thousand acres in citrus fruits, 7,000 acres in bearing, over one million boxes of oranges shipped last season, over $1,000,000 received for dried fruit products annually, over $500,000 received for green fruit shipments, pay roll from creameries, for butter fat alone, over $100,000 per month; two of the largest fruit canneries in the state at Visalia; population has more than doubled since 1900.

Laborer Worthy of His Hire

As may be noted in the report of the committee on standardization at the recent meeting at Newcastle, many growers refused to pay the one-fourth of one cent per box for the expense fund of the committee put in charge of standardization. The loss was later made up by certain shippers agreeing to make it good. Therefore the committee secured its funds for the season's work, but did not have the good-will of the growers behind them as they should have had. It is indeed most discouraging for committeemen to give of their time and even dig from their own pockets good money to help along the cause for the benefit of all the growers. The quarter cent per box is so infinitely small that the grower who refuses it to such a committee which is looking after his interests has no conception of the needs of his own industry.

We trust another season will see the committee feeling that behind it is the fullest and most complete support of every grower of green deciduous fruit. The great measure of success secured by citrus growers of the southern part of the state is due to this one factor of standing togther almost as one man behind the committees appointed to look after the interests of the entire industry. If the laborer isn't worthy of his hire he should at least be worthy his expenses.

Surfeit of Good Things

Next week, which begins on Monday morning, the 5th, is filled with events of interest to agriculturists. The Petaluma Poultry Show at Petaluma, the State Fruit Growers Convention at Stockton, the Tulare County Citrus Fair at Visalia, the fall meeting of the Claremont Pomological Club at Claremont, together with the Imperial County Agricultural Fair at El Centro, makes it a full week from one end of the state to the other. While these important events are widely separated, yet they are of such interest that many would like to attend more than one, which makes a somewhat unfortunate situation.

Fruit Growers Convention

The thirty-fifth convention of the State Fruit Growers will be held at Stockton next week, beginning on Tuesday morning. A full program has been provided; we doubt not, as is usually the case, too full a program. The principal theme will be standardization and general discussion of marketing of green deciduous fruits. Commissioner Jeffrey makes a hobby of the marketing question, and while he believes that cultural conditions should be brought to the attention of the growers that they may produce a finer grade of fruit, yet he feels that the growers are more advanced along that line than in the one of marketing and securing best returns for the fruit they have produced. Sessions will last day and evening from Tuesday morning until Friday afternoon.

Farmers Institutes

The dates for farmers institutes for the Imperial Valley announced by Mr. Neff a few weeks ago have all been called off because of the Imperial County Fair occurring the same week.

Powell in California

California's enterprisinng fruit growers have won one of the most valuable men in the United States. They went to the Department of Agriculture and chose one of its brightest men and made him so attractive an offer that he has given up the Department work, and after the first of the year will take up the fight for California fruit interests. We refer to G. Harold Powell, for years in charge of field investigations for the Bureau of Plant Industry of the Department of Agriculture and more recently head of the Bureau. From this responsible position, Mr. Powell has been induced to come to take charge of the California Citrus Growers League, of which he will be secretary and general manager. This league was organized to look after the larger interests of the citrus growers, and is composed of not only the largest shipper in California, the Fruit Growers' Exchange, but of practically all other shippers. The largest questions which come before this league are those concerned with the tariff and transportation. Mr. Powell's experience in California, where his services resulted in the saving of millions of dollars to the citrus and grape growers, has given confidence in him which will wonderfully aid him in his new work. The whole state will extend to him a cordial welcome.

Orchard Help

The Santa Clara county branch of the Farmers Educational and Co-operative Union appointed sometime ago a committee on white labor for California fruit growers. This committee is inaugurating a movement to secure from boards of education aid in the labor question in arranging school sessions so as best to aid in the labor problem of each district. For instance, in Gilroy this present season prune growers were handling the labor situation very satisfactorily until the opening of the schools which occurred in the middle of the prune gathering season, and instantly the growers were confronted with a situation which spelled great loss. The committee informs us that some educators in the state are joining with the Union in this movement, and the Union itself is putting forth every effort through its own organization.

We believe this movement would not affect the value of school work. While it might not be in theory as satisfactory to the state or county superintendents of schools, the benefit locally would be enough greater to justify any slight inconvenience. This plan, of course could not be followed in the citrus sections where the season lasts nearly the whole year, or at flood tide at least half the year, but in that industry the labor question is more easily handled. With small fruits and deciduous fruits, however, the springtime and summer are the seasons requiring greatest labor. Here children from ten years up may be of great aid.

The solution of the problem of "California for white folks" is worthy best thought of her best people.

Experiment Stations

As an example of the extended work being carried on by the Department of Agriculture we may refer to the fact that not only are Experiment Stations established in all the states, but in Alaska, the Hawaiian Islands, Guam, Porto Rico and the Philippines. These outlying stations are naturally engaged in solving the fundamental problems of agriculture. Especially is this true in Alaska and Guam Island, where practically nothing is known of the possibilities. In Porto Rico experts are studying into pineapple and sugar problems. The pineapple and coffee plantations especially are being investigated for "sick" soils. The addition of fertilizers and of humus does not seem to aid in producing crops successfully. A trouble which is called mosaic disease, in which there is a lack of chlorophyll is being investigated. It is thought to be caused by excess of bacterial life and treatment with carbon bisulphide has been found successful but at a prohibitive cost. Some cheaper corrective will yet be found.

In Hawaii, studies of the soil were among the earliest scientific investigations taken up by the station. The total nitrogen content of some of the soils was found to be higher than the crop production would indicate and investigations showed much of the nitrogen to be present in organic forms that are not available for plant growth, if not actually detrimental.

Agricultural News Notes of the Pacific Coast

Northern California

Geyserville, Sonoma county, is still shipping prunes.

Petaluma's prices on Thanksgiving turkeys were 27 cents per pound, live weight.

Articles of incorporation for the Haywards Poultry Producers Association have been filed.

New reclamation districts have been formed in Yuba and Sutter counties near Wheatland.

The Sacramento Valley has shipped this season practically 14,000 cars of deciduous fruits.

Horticultural Commissioner Galloway of Sonoma county is giving addresses on fruit tree spraying.

Eastern homeseekers have secured a big farm in Sutter county, which they will subdivide and irrigate.

There was a registration of thirty-six in the short course in agriculture at the State Farm at Davis.

Orange growers at Biggs, Butte county, shipped their first carload of fruit to Eastern markets this year.

It is rumored that a large reclamation scheme in Yolo county will be financed by Los Angeles capitalists.

Levees are being constructed to reclaim rich lowlands on the Bear River, near Wheatland, Yuba county.

A dam across the Mokelumne River has been completed. It will furnish water for 60,000 acres of land near Lodi.

Eighteen thousand acres of land near McArthur, Shasta county, is to be drained and reclaimed at a cost of $100,000.

The levees near Yuba City have been raised from five to eight feet above high water and farmers feel more secure.

Petaluma Show Association offers $2,000 worth of prizes at its fourth annual poultry show, to be held in Petaluma December 7th to 13th. H. R. Campbell is secretary.

A large cheese factory is being built at Novato, Marin county. It is to take the place of the French factory, recently destroyed by fire.

Steamers are carrying away great loads of beans from lower Sutter county. They are shipped to Sacramento, Stockton and San Francisco.

Sacramento is making preparations for a reception for the Western Fruit Jobbers' Association members, who will meet in cenvention February 15 to 18.

The early November rain was beneficial to Butte county oranges. While they are now ripening more slowly the growers think they will have finer flavor.

A farmers protective and benevolent association has arranged to conduct a model town near Livermore, Alameda county. It will be surrounded by five acre tracts farmed on the co-operative basis.

Humboldt county creameries paid the following prices for the first of the month deliveries: Capital 39c, Central 38¼c, Grizzly Bluff 39c, Swift & Co., 39c, Libby, McNeil & Libby, 39¼c.

Central California

Peach growers are busy spraying for blight.

Grangeville, Kings county, recently held a chrysanthemum fair.

That Tulare County Citrus Fair opens at Visalia next Tuesday.

A big grain ranch near Tulare is to be transformed into a dairy ranch.

Lindsay is planning for a fine exhibit of oranges at the Visalia Fair.

The wild ducks of Tulare lake are again dying off without any apparent cause.

The livestock inspector of Fresno county is busy dipping stock to eradicate the Texas fever tick.

Watsonville apple growers have so nearly finished their campaign that laborers are leaving for other fields.

Some orange packing houses closed after the holiday shipments to await more perfect ripening and holiday demand.

The San Joaquin Almond Growers' Association recently held a meeting at Lodi and discussed market conditions.

The Chamber of Commerce of San Jose is taking the initiative for a county fair to be held in the near future.

The last beets sliced at the Spreckels Sugar Factory went through the mill on November 17th. The season began August 25th.

Raisin people are again contemplating the formation of a merger which may be able to hold its own against the consolidated packers.

Ranchers at Newman, Stanislaus county, have again made contract with C. N. Hatfield to "make" rain for them for the sixth season.

Tulare County Forestry Booard has placed notices warning people against injuring or removing any trees along the highway.

The Turlock Fruit Growers' Association, organized last spring, handled forty-seven cars of fruit, nearly twice as much as anticipated.

The People's Canal and Ditch Company, supplying lands near Hanford, is completing a new weir which is declared to be very effective.

The State Convention of the Farmers Union held its annual session in San Jose last week. Over 200 delegates were in attendance.

Tulare county orange growers are concerned over the publication of false statements of damage from thrips. It is said the damage is very limited.

Porterville Chamber of Commerce will incorporate so as to better conduct its business and attract attention to the agricultural resources of that section.

The directors of the Corcoran Sugar Factory recently held a meeting and considered the proposition of transferring the sugar plant to New Jersey capitalists.

Santa Clara county farmers have experimented in peanut culture during the past year and had good results. Some acreage has produced from $150 to $200; besides the tops make excellent hay.

Southern California

Imperial Valley was given a heavy rain last week.

Ontario reports oranges coloring and promises to ship a quantity of holiday fruit.

One Imperial Valley turkey raiser marketed 2,000 turkeys for the Thanksgiving trade.

San Bernardino reports olive orchards in that section producing exceptionally heavy crops.

The Whittier Vegetable Growers Association is shipping fresh tomatoes to New York in car lots.

Without any free government grazing land Imperial county is already making a record as a wool producer.

A modern packing house has been constructed at Corona, Riverside county, and was formally opened on November 1st.

Several thousand dollars was distributed to turkey raisers of Escondido, San Diego county, just prior to Thanksgiving.

The warehouse at Lancaster, Los Angeles county, has thousands of sacks of wheat and boxes of apples stored for later shipments.

A packing company in San Diego county has made a shipment of 30 tons of raisins to New York by water and the Isthmus of Panama.

Southern California's lemon shipments are far greater than last year at this date, but oranges though a larger crop are slower in coloring.

The Consolidated Water Co. which is running a tunnel in the mountains north of Ontario recently struck a volume of water equivalent to a small river.

Development is beginning in the Chucawalla Valley in eastern Riverside county, one settler already arranging for the putting in of a half section to alfalfa.

Farmers institutes announced for the Imperial Valley have been recalled because of the fact that the County Fair at El Centro occurred the same week.

G. Harold Powell has tendered his resignation to the Department of Agriculture and will take up work in Southern California at the head of the Citrus Growers League.

The Rincon Indian reservation in San Diego county is being given preliminary surveys in preparation for an irrigation system which will cover about 400 acres of tillable land.

The Ventura County Bean Association has shipped out of Oxnard over 500 cars of Lima beans. The association paid out last year to farmers of Ventura county in excess of $600,000.

The Tri-County Freight Bureau of Riverside, San Bernardino and Imperial counties has perfected its organization for the purpose of securing terminal freight rates for Colton.

R. M. Teague, the San Dimas nurseryman, has filed on 350,000 inches of the Colorado to be taken from the river near Parker and conveyed to Chucawalla valley and Palo Verde mesa land.

The Coast

The big Roosevelt Dam in Salt River Valley, Arizona, cost over $8,000,000.

The Oregon state board of horticulture reports this year's apple crop at 1,250,000 boxes.

A temporary advance in wheat at Pendleton has succeeded in moving 100,000 bushels.

Grain growers at Walla Walla, Washington, have advertised for bids for 4,000,000 grain bags.

The extension of rubber plantations is being encouraged in the Island of Mindanao, P. I.

Forest service men have been planting larch and pine on the burned forest reserve near Wallowa, Ore.

The apple fair recently held at Albany, Ore., gave to Lane county the $100 silver cup for the finest county exhibit.

A hop grower at Eugene, Oregon, produced 103 bales of hops from eight acres, an average of 2500 pounds to the acre.

Farmers near Grangeville, Idaho, are refusing to sell because of the combination of beef buyers holding down prices.

A series of farmers institutes was begun in the Salt River Valley on Monday of this week to continue until next Wednesday.

Los Angeles county bee men are reported to have sold many stands of bees which will be transferred to "desert" sections.

Heavy rains near the close of the National Apple Show at Spokane greatly reduced gate receipts and caused financial loss.

Orchard owners at Starbuck near Dayton, Washington, are raising funds for advertising the agricultural possibilities of that section.

Tucson claims that over $250,000 will be distributed to cattlemen of that portion of Arizona as a result of this fall's cattle shipments.

Experimental plantings of lemons on Mindanao have resulted in exceptionally fine fruit that promises a future for the industry.

Wheat buyers at Walla Walla, Wash., recently advanced the price two cents, resulting in forty cars of grain being sold in a few days.

The Umatilla county division of the Farmers' Educational and Co-Operative Union was addressed at its last meeting by Government experts in dry farming.

Secretary Ballinger has advertised for bids for the excavation of seventy-three miles of sub-lateral ditches under the Tieton unit of the Yakima irrigation project. Proposals are to be opened December 3rd, at North Yakima.

An object lesson at the National Apple Show was the packed box of Pacific Coast regulation size which is slightly short the number of cubic inches in a bushel, but alongside was a bushel basket which would not contain the apples which had been placed in the box.

The worst thing we have to contend with in getting new customers to try

West Coast Egg Food

is the "stuffs" that have been put on the market called "egg foods," largely composed of unsound grains, mill refuse, and cheap, very cheap, Japanese rice bran and such offal. When we once get a trial of "West Coast" we have no further trouble. No such stuffs in ours. We are winning out in great shape by making first-class feeds at prices as low as those "cheap" ones. Try "West Coast" just once. 75-lb. sack only $1.80, or $45.00 per ton. If not sold by your dealer, send to us. Or, if you are distant from Los Angeles and have good grain products cheaper than to ship them in, you can make your own Egg Food as good as anybody's.

Egg-More Booklet

tells you how. It is free. Send for it. Send us addresses of 5 persons in your vicinity who have fowls, and we will send you an Anchor Egg Separator. Or, for 20 addresses, we will also send The Poultry Manual, a book well worth 50c, both postpaid.

West Coast Mill

Office and Salesrooms, 115 Winston St.
Los Angeles, California

Coulson's
EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying powers and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the famous Coulson products and gives valuable information about Poultry Raising.

The Kramer Co., Paxton, Illinois

Practical Poultry Culture

GEESE PROFITABLE.

By Prof. M. E. Jaffa.

The time to purchase geese is in the fall; and the time to think about it is right now. It takes some time for these fowls to become accustomed to a new place, and unless they have come to feel perfectly at home in their new surroundings by breeding time, it will be useless to expect good results. And first-class geese, of a proper age and of a desirable breed, cannot always be bought at a moment's notice. It often requires considerable time to locate the stock when it is wanted, so it behooves the farmer to begin thinking over the proposition.

The word farmer is used advisedly, for it is to him especially, and not to the Simon-pure poultryman, that this article is addressed. For the man who wishes to specialize on some one kind of poultry, the chicken, duck, pigeon, etc., would have many advantages over the goose. But for the farmer there is no fowl that will give better returns for less trouble, and will prove in the main, so satisfactory an addition to his place as will the goose.

Any income, however small, that comes in as an extra, that is derived from sources other than the usual farm crop, is always most welcome. It is like money found, instead of money which is wrested from the soil by hard labor.

The large majority of farms have some bit of land whose soil or location renders it unfit for profitable cultivation. If it has some water on it, a brook, a ditch or a spring that is not used for drinking purposes, it can be made to yield a splendid profit as a range for a flock of geese. Even a few birds will pay for the little attention they require. They will forage for themselves a good part of the year, and their demands in the way of housing and nesting accommodations are the least exacting.

Geese my be kept in the same pasture with other stock, where no separate or unused piece of ground is available. This is a truly economical arrangement for neither of the two sets of occupants is likely to interfere with the other. Geese can protect themselves from enemies and thieves, and may even prove a protection to the other stock.

The best way to begin an enterprice of this kind is with the mature birds. It is, of course, possible, when such birds cannot be found, to wait until spring and set goose eggs under hens. But such a beginning is not inspiring, and should be a case of "must," not of deliberate choice. It is weary work waiting for the baby goslings to grow into three-year-old birds, as they must before they are ready for breeding purposes. It is far more interesting and stimulating to buy the mature stock and have everything in full swing on the place by the following spring.

Any breed of geese is good for the farmer, except the Egyptian, which is purely a show bird. The gray African seems to be a great favorite especially when geese are raised on a lrge scale. The Chinese geese are small, weighing much less than the others, but they make up in flavor of meat and productiveness what they lack in size. They average 50 to 60 eggs a year. These, and the Embden and the Toulouse are probably the most profitable. The Gray Toulouse are especially liked because of their size and their longevity.

Buy a couple geese, three or four years old, and a gander, one or two years old, or better still, just a pair. When they have mated, a pair or more of any other breed may be turned into the same pasture, without danger of cross-breeding. A low shed open at one end will prove sufficient protection. There should be three little families of goslings from each goose, next spring, if judgment be used in the management. In order to accomplish this, it is necessary to take the first two batches of eggs away from the goose and give them to broody hens to hatch out. The goose may be broken of her desire to set by a few days' confinement in a dark box or coop, on a diet of water. After she is liberated she will take to laying again. She may be allowed to hatch out her third sitting herself.

These foster mothers should be arranged for ahead of time as they are most important to the plan. If there are no hens on the farm or if the breed kept is one of the non-sitting varieties it would be well to purchase some for this purpose. If this is not practicable it might be possible to arrange with some neighbor for the loan of some broody hens when they are needed. People who hatch by incubator have no use for their sitters. If all the plans fail then the goose must be allowed to do her own hatching and the farmer must content himself with one family of goslings to each mother.

In calculating on the number of hens needed it must be remembered that goose eggs are very large, and therefore a hen can not be expected to cover more than three to five eggs, according to size of the hen. A goose usually lays ten to eighteen eggs, before she begins to sit, so the number of hens required may be arrived at by a little arithmetic. Hens are apt to become impatient under the circumstances, as the period of incubation for goose eggs is nine days longer than it would be for their own. It is therefore a mark of wisdom on the part of the farmer to provide a few relief mothers for emergencies.

The advantages of keeping geese are really many. They not only serve to make otherwise useless pieces of land profitable, but yield their profit on little time, trouble or expense. They lay for many consecutive years, ten to twenty according to the breed, so that the original outlay is quite lost in the long list of returns. They require little shelter and are quite free from diseases. Even the goslings become independent and self-supporting at an early age, and may be safely emancipated from their foster mothers when they are a week old. When the pasture is good it is not necessary to give any daily care whatever to the older birds, for a box of oats or barley may be left in the field without danger of the fowls over-eating. They prefer to forage for the bulk of their food. There is, besides all these the added advantage of a second source of income, that which is derived from the sale of the feathers.

SOW SEEDS RIGHT

Sow Seeds Evenly Perfectly—Quickly

Here's the famous Thompson Wheelbarrow Seeder that has meant better stands of alfalfa, clover, timothy, red top, orchard grass, blue grass, etc., for nearly forty years. Over 200,000 now in use—all making big money by increasing crops and saving seed. Sows most uniformly and economically, covers all ground evenly—never wastes seed. Sows any amount to the acre, fast or slow—30 to 50 acres a day. Hopper carried close to the ground—wind does not affect the work of

Thompson's Wheelbarrow Seeder

Works equally well on rough or smooth ground. Lasts a lifetime but quickly pays for itself. Perfectly balanced. Made in every style and size to meet every condition. There's a Thompson for you no matter what seed or how many acres or what quantity to the acre you sow. Lightest, strongest and most durable. Weighs 45 to 50 pounds complete. Large wheel runs easily. Anybody can use it. Absolutely guaranteed.

The Arenberg Brooder Stove

Proven to be the most successful Brooder Stove on the market. Awarded gold medal for most Meritorious California invention at California State Fair, Sacramento, September, 1910. Burns distillate, perfectly simple and easy to manage. Write for details. **H. F. ARENBERG, Petaluma, Cal.**

The Rural Californian, the leading monthly $1.00 the year.
The California Cultivator, the leading weekly, $1.00 the year.
Both one year for $1.50.

Geese should be picked twice a year, in the spring and fall. It is really as necessary to their comfort as is the shearing to a sheep. Wait until you see them pulling the feathers out themselves and throwing them on the ground and you may know that the time has come for them to be relieved of the loosened feathers. These may be sold for 75 cents to $1 a pound, and there is always a demand for them.—M. E. Jaffa in The American Weekly."

BLACK HEAD IN TURKEYS.

There has been considerable loss among turkeys in Colorado this fall from black head, or what is scientifically known as Entero-hepatitis. The name black head was given because the head is supposed to turn purple when the turkey is attacked by the disease. This we have found not always to be true. The name Entero-hepatitis was given on account of the greater diseased areas occuring in the intestines and liver.

The disease is caused by a single celled animal parasite called Amoeba meleagridis. This germ, or protozoa, is taken into the body through the food, or water, and becomes lodged in the mucous membrane of the caecum, or blind gut. Here it produces thickening of the wall, due to inflammation, and, later, ulceration. The liver becomes infected, and the infected areas, the liver cells, are destroyed. In a turkey dead of the disease the liver is enlarged up to more than twice its normal size. Over the surface will be noted whitish or yellowish green areas. These represent the areas of dead tissue.

Treatment.

This consists principally in preventing the spread of the disease; when a bird has developed the disease there is no known cure. The premises should be as thoroughly cleaned as possible and all rubbish burned. Then, disinfect, as far as possible, with a five per cent solution of carbolic acid, or creolin. Sick turkeys should be isolated and not allowed to run around and spread the germs of the disease, and thus be the cause of others becoming infected. As there is no known cure for the disease, the turkey had better be killed and the body cremated. Feed should be given in troughs, rather than thrown on the infected ground, and thus increase the danger of infection. The watering troughs should be enameled so that they can be thoroughly cleaned morning and night. An intestinal antiseptic should be given in the water. One teaspoonful of dilute hydrochloric acid to each quart of water, or one teaspoonful of the crystals permanganate of potash to the ten quart bucket of water, may be given.—B. F. Kaupp, Pathologist, Colorado Agricultural College.

THE MITE.

The most deadly foe of the farm fowl is the little mite, whose smallness is counterbalanced by the enormous numbers in which he appears in the hen house. Without a doubt the numbers in an infested hen house will often run into the hundreds of thousands, perhaps millions. A single mite can do no harm, but thousands can. We have seen sitting hens killed by these mites, and there is no doubt that often their presence in the flock causes a very great decrease in the production of eggs by the fowls.

These mites are grayish in color before they have feasted on a fowl. Then they fill themselves with blood, and this shows through the transparent skin of the mite. This gives them the red color by which they are known—little red mites. In their natural color they are little noticed on the roosts and under the straw and other litter and in the hen nests they multiply with great rapidity and by March have filled every crack in the poultry house where they are permitted to remain.

Until the writer lost a sitting hen by the attacks of these little vampires he did not believe that it was possible for such small things to kill a large, strong, vigorous hen.

Having had no mites in the hen house for years, the writer did not believe that any existed there at the time two hens were set in rather dark nests. In about two weeks one of the hens seemed to be sick, though no particular trouble was noticed. Her comb had turned dark—almost black. She was taken from the nest and carefully examined, but nothing was discovered to indicate the source of the trouble. Of course, the mites which had been sucking her blood in the night had all left her by daylight and taken refuge under the straw in the nest. Two or three days after that the hen was found dead, half way off the nest, with her wings extended. The little vampires had sucked such quantities of blood from her that there was not enough for heart action.

Another hen was placed on the eggs, and in two or three days it was noticed that her comb was also becoming dark and that she was growing weak. She was taken off the nest and was almost too weak to move. The eggs were taken out and the straw removed. Then it was discovered the bottom of the nest was one mass of red, fat mites, every one of which had nightly feasted off the sitting hens.

There is no doubt that, in addition to the damage these mites do in sucking blood, there is another damage they do that must not be lost sight of—they spread disease from one bird to another. The losses from this cause must be very great.—Inter-Ocean.

PURE BREEDS ARE BEST.

Occasionally one comes across a farmer who belives that common scrub fowls are hardier and more profitable than the pure breeds, but the number is getting less every year.

It costs no more, after the first purchase, to keep a flock of improved fowls than it does to harbor dunghills or cross breeds. Either kind, when properly fed, will eat just about as much as the other. Of if there be any saving, it is so trifling as between one or the other kind, that it is not worth noticing. If judiciously provided for and tended from the shell upward, as all fowls should be cared for, either of the larger breeds will make good eating poultry at the proper age, and the hens of any one kind will lay an abundance of eggs, take them as they average, throughout the year.

Among any of the pure breeds there will always be found some exceptionally good ones for breeding purposes, or for exhibition. All these finer specimens will command the highest current prices among fanciers or amateurs, who are about to commence the propagation of prime stock,

A Healthy Chicken is an asset, a sick Chicken is a liability because it is apt to give disease to others, it's therefore a loss, not a gain

To keep your poultry healthy—to make every hen an asset, regularly use in the feed twice a week,

Coulson's

No. 3 Condition Powders

Give it to well chickens to KEEP them well, give it to sick chickens to MAKE them well.
Helps chickens to digest and assimilate all their food, makes hens lay right up to molting and starts them laying quick after the molting season.

and who are disposed to pay the better prices for such specimens. At the same time, the imperfect birds, as to form, color and other Standard requisite points, come to good size at maturity, and will pay much better for their keeping, at the right killing age, than will the runts or the smaller barnyard fowls, which cost quite as much to feed and to bring them to the proper state for slaughtering. The improved hens will, in a season, lay one-third more eggs, in number, and of a larger size usually, than will the dunghills. As broilers, the young cockerels of the heavy breeds are fitted for this purpose at a much earlier age, and so are far more valuable in this respect than are the lesser sized or common varieties.

In any view, then, it has come to be well determined that pure bred fowls are the most economical, the most valuable and the most desirable for all purposes, and although any of these better breeds cost a little more at the outset, the product they yield in twelve months in eggs and meat alone, saying nothing of the income that may be had from extra good specimens, will be found far more satisfactory and more profitable than will the same number of the ordinary dunghill breeds.—Kansas Farmer.

ALAMEDA COUNTY SHOW.

California imports ten million dozens of eggs annually. One city alone, San Francisco, receives two cars of eggs weekly from east of the Rockies. Yet, occasionally one hears the question of overproduction raised. No danger for years to come. Therefore the enthusaism displayed at the show of the Alameda County Poultry Association last week may be justified for commercial reasons as well as because of the love of pure breeding. It was a great show in quality and quantity. Including pigeons over 2,000 entries were made. Old timers declare, "This is the best ever held in Oakland." W. E. Stansfield of Hillsdale, Mich., judged the poultry, and a large number of perfect birds were found. Of the many varieties shown by owners from all parts of the Pacific coast almost every bird has been awarded a prize.

The pet of the show was a Rhode Island Red cock, the property of E. K. Healy, secretary of the association. This bird, one year old, has taken five first prizes. A White Orpington, the property of W. H. Ingram, has also taken five firsts, at San Jose, Stockton, Sacramento, Hayward and Oakland. James Stansfield of Fruitvale had a splendid hen of the Buff Wyandotte variety which has taken 30 first prizes in exhibits in all the coast cities. This hen took first prize in the show of the Alaska-Yukon Exposition in Seattle.

Other notable winners were Columbian Wyandotte hen owned by C. J. Seigfried of Alameda, Houdan hen by V. C. Smith of Napa, Silver Penciled Wyandotte hen by Mrs. Geo. Grindall of Hayward, Single Comb White Leghorn of E. R. Everett of San Jose and the Black Leghorn of S. F. Jones of San Mateo.

Secretary E. K. Healy is justly proud of the results of this great show.

CRACKED CORN.

For laying hens it is better to have the corn cracked rather than to feed it whole. The period of exercise is too short when whole corn is given, when cracked at least double the amount of work is given the hens in getting it, which is very important when eggs are the object in view. Then it can be fed more freely and generally than whole corn, but it should be cracked only as fed, then securing its full food value. Some object to its use on account of trouble in cracking it and the loss of the fine particles when fed in the litter. A good plan is to have a mill for this purpose, with a sieve for cracked corn to fall in. In this way the meal and fine parts are separated making no loss whatever. For chicks on free range cracked corn can be fed alone with good results.

Always keep young poultry out of wet grass and never allow them to run at large when the weather is cold enough to thoroughly chill them.

If the fowls are pulling the feather from one another' necks, mix a little powdered rhubarb with carbolated vaseline and apply to the bare places and surrounding feathers.

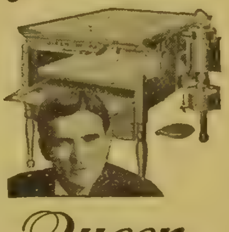
I'll Start You in Poultry on the Make-Good Plan



Queen

—Set you up in a paying business all your own—a business you can control and expand indefinitely—one you can operate on little capital and in small space—one that will give you real independence, pleasure and profit. Mail me a card to-day for my book containing the remarkable terms on which I am selling Queen Incubators and Brooders, freight prepaid. I have started over 61,000 people on the road to success. The Queen goes out on the make-good plan, the most liberal ever offered on a high grade incubator. My 1911 Poultry Guide and Catalog explains terms fully. It's a down-to-date poultry book, practical, concise, helpful—best book of the kind published. Write and let me mail it to you free.

WICKSTRUM, Queen Incubator Man, Box 53, Lincoln, Neb.

This open front door makes perfect ventilation

Mandy Lee is Miles Ahead
It is the only Incubator without a "Sealed," Air-tight Egg Chamber. It supplies the life-giving oxygen freely, draws off the carbonic acid gas, and is saving the lives of millions of chicks.

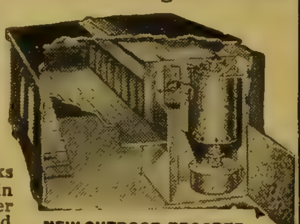
READ the story of the Mandy Lee triumph in our new catalog. Other incubators are already preparing to imitate and profit by our great discovery.

No guessing with a Mandy Lee

You cannot afford to buy an old-theory incubator which may go out of date and be discarded next year. You should know the truth *now* about the great discovery. The book is free. Ask for it.

There IS Something New in Incubators
We have taken the boldest and most important step ever taken in incubator building. See the openings into the egg chamber? They mean the saving of chicks' lives. It is the key to *right* hatching. Ventilation in the Mandy Lee is now perfect. It goes on all the time, neither above nor below, but right *at the eggs*. Every minute of the hatch the life-giving oxygen is freely passing in to the eggs and the carbonic-acid gas is passing out. And correct ventilation is just one of the great Mandy Lee features.

We Don't Guess—We Measure
The Mandy Lee is as far in advance of other incubators in heat and moisture as it is in ventilation. We do not guess at anything. The sensitive regulator controls heat to the fraction of a degree and *we measure moisture* just as accurately with the Mandy Lee Hygrometer (one sent with every incubator). You know what you are doing. *You* measure and control moisture; *you* control the hatch. The Mandy Lee is the all-season, all climate, all condition hatcher, always producing the most and the strongest chicks.



NEW OUTDOOR BROODER
Heated—Storm-proof

Mandy Lee Brooders give direct contact heat to the backs of the chicks. That is *real* mothering, the most important thing in poultry. Hovers are raised and lowered as weather gets warmer or cooler—heated from end to end. Chicks do not pile up and smother. Write to-day for catalog and full information.

Bees and Their Care

TREATING FOUL BROOD.

In the East I never had foul brood; and when I met it face to face in this country, I was somewhat nervous as to my ability to cope with it. However, as I was associated with Mr. J. K. Williamson my fears were soon over, he being a very careful observer. This article is largely due to his headwork.

In the spring of 1903 Mr. Williamson had his bees rented to two parties, one of whom, I am sorry to say, was not as careful with the disease as might be after having been warned of the possible existence of foul brood. The result was, in the spring of 1904 the disease had been spread by the interchanging of combs to such an extent that it was very difficult to deal with it. The season was very dry, with no honey-flow; and with the usual tendency in such cases for bees to rob, it would have been absolutely ridiculous to have put these diseased colonies on foundation, as it would have meant starvation. We just watched them closely, and if any showed signs of being overcome by disease we melted the combs, scalded the hives, and counted the colony lost save for the hive and wax.

Right here let me say that we have never had any trouble with hives used again after being properly scalded. Some of these colonies were carried over until the following spring with very little indications of trouble. Some we were compelled to melt up to save them from being robbed out, and the disease thus spread again. A few in which only a few cells appeared were "carved out"—that is, a small piece of comb was cut out around the diseased cells and carefully destroyed; and, strange to say, most of the carved-out colonies are still intact, with no sign of the disease having reappeared after four years.

One colony, however, that was carried over during the dry year and put repeatedly on foundation the following season, and given nearly every known treatment for cure, during the following season was finally, as a last resort, sulphured at night, and bees, frames, brood and honey were burned, after which the hive was scalded and used again. The wax from this colony might have been saved; but so many failures make one desperate, and thus it ended.

I do not believe disinfecting is equal to thorough scalding, as this method does not reach the cracks and crevices as thoroughly as scalding water; neither do I see the object in scalding frames with lye and corrosive sublimate when hot water is just as effective, in my mind, and cleaner; besides, one can then save the adhering wax.—P. C. Chadwick of Redlands, in Gleanings.

WHY BEES GNAW COMBS.

It is stated by some good authority that if bees are given full sheets of foundation, all worker-sized cells, their instinct and craving will be so great for drones and drone-sized cells that they will often gnaw down a portion of the foundation and rebuild it with drone comb. I have watched this closely for the past 25 years, and have yet to see a case where the bees gnawed down the foundation and rebuilt it at once with drone comb. You will notice that I emphasize the words "at once," for I have many times known bees to gnaw away at least a third of all the combs in the brood-chamber and later rebuild it with drone comb; but at the time the gnawing was done the bees had no thought of rearing drones or building drone comb. My experience is that this gnawing away of either combs or comb foundation is done at a time when no honey is being gathered; and the more prolific races of bees, such as the Cyprians, Syrians, Carniolans, etc., are much worse at this naughty act of gnawing their combs than are the native black bees or the Italians. I will try to explain further why this is so. Of course, if comb foundation is in any way defective or distasteful to the bees they will proceed at once to gnaw it down and rebuild with both worker and drone comb; but at the time this gnawing away of ready-built combs takes place they will as readily remove drone as worker combs—that is, provided the combs are alike as to age, etc.

The question may be asked why bees gnaw combs, anyway. The most common cause is the need of wax. At a time when but little honey is being gathered, bees secrete little or no wax; if a colony has a good queen and plenty of stores, brood-rearing will continue more or less all along, and there is a constant call or need for wax by the bees for capping the brood and mixing with propolis to chink up cracks with, etc. At such times bees will not draw on their stores sufficiently to secrete wax; so to supply this want or need for wax they will begin gnawing the combs near the bottom next to the entrance of their hives, and will continue this gnawing until brood-rearing ceases or until a honey-flow comes on; and the more prolific races of bees, as above mentioned, will rear more brood during a honey-dearth than either Italian or black bees, and so, of course, need more wax, and gnaw their combs worse. It makes no difference at such a time whether it is drone or worker comb—it will be gnawed just the same.

Then these combs will not be rebuilt again until a honey-flow comes on and the bees begin to get crowded for room, and, of course, at such times it is only natural for them to build drone or store comb. I doubt whether bees ever gnaw down either comb or comb foundation with the full purpose in view of rebuilding it with drone comb.

We all know that there are other causes for bees gnawing their combs, such as moldy moth-eaten combs, and combs where pollen has caked and hardened in the cells, etc.

Bees here in the south will swarm if well supplied with honey at the swarming season, whether new honey is coming in or not. I have known them to swarm when no honey whatever was being gathered. If hived on foundation at such times they will draw out a small patch in the center of a few sheets, and the queen will start laying in the cells drawn out. By this time the bees will have used up all the wax scales they secreted before they left the parent hive, and they at once start to gnaw the foundation to supply the wax to cap the brood with, etc., and, later, a honey-flow comes on, they become prosperous, and soon more room is needed, and they will build store or drone comb in the places where they had a short time before gnawed away the foundation. The apiarist concludes, when he examines his bees and sees this drone comb where he had put in full sheets of foundation a short time before, that the bees had gnawed down the foundation for the purpose of building this drone comb, when the truth was they had no thought of building comb of any kind when the gnawing was done.—Gleanings.

This is the college that secures the positions--

The Polytechnic Business College of Oakland makes a specialty of high grade work and high grade positions.

Graduates of the Polytechnic College are earning salaries because they had the training demanded by the business world.

ROLL OF HONOR

Here are a few names taked from a Roll of Honor just published by the college:

Louis C. Drapeau, Salary $5,000 per year.
Walter Moore, Salary $250 per month.
Elbert Hugill, Salary $2,000 per year.
Miss Minnie Lowry, Salary $100 per month.
Georgia Hunt, Salary $135 per month.
Miss Alta Gordon, Salary $125 per month.

And hundreds of our graduates are getting from $60 to $85 per month.

Come to the POLYTECHNIC where advantages are the best.

Digs Twice as Fast as Bar and Shovel

This Keen Kutter Post Hole Digger, shown here, is a *labor-saving* tool—really is *two* tools in *one*. It takes the place of ordinary bar and shovel and sinks a hole much faster and cleaner.

The two illustrations show how it operates. Simply drive the sharp crucible steel blade of the

KEEN KUTTER
Post Hole Digger

E.C. SIMMONS KEEN KUTTER TRADE ST LOUIS MARK U.S.A.

into the soil as you would a common steel crowbar, spread the handles and *lift*. It is *sure* to hold securely and bring up a full load of earth.

Every farmer's tool-house should hold this post hole digger and a full line of Keen Kutter hand farming tools—forks, scythes, hoes, rakes, axes, spades, shovels, corn knives, etc.; and his shop should be equipped with Keen Kutter carpentry and blacksmith tools. Sold under the famous Keen Kutter guarantee, which means satisfaction or money back.

Irrigation and Forestry

WATER IN MOUNTAIN STREAMS.

Look out for the campers above and protect the campers below, says Dr. Raymond Russ, Acting Secretary State Board of Health, in warning vacationists about stream-borne typhoid germs and exposing the teeth of fallacious old "saws" about the rapid self-purification of running water.

"The typhoid fever bacillus," states Dr. Russ, "is not known to multiply under natural conditions outside of the human organism. When thrown off in the wastes of the body it eventually dies unless it succeeds in gaining an entrance to another human host. But it is capable of living for several weeks in running water. Mountain streams through shaded canyons afford swift and comparatively safe means of passage for these deadly wanderers. Unwary campers along the banks make a favorable field for invasion. Those who give credence to fallacious old saws about water purifying itself in running two feet, or two miles, or some other absurdly short distance, are especially open to attack.

"Water appearances are deceitful. The presence of typhoid germs in a stream is not necessarily accompanied by turbidness, offensive odor, or foulness of taste. It is best for campers to boil their water unless they can make sure that the sources of the stream are unpolluted. Danger may lie in the presence of a careless camper a hundred yards up stream who is coming down with typhoid fever. Or twenty-five miles further up, the stream may catch the underground drainage from the toilets of a lumber camp where there are several "carriers," that is, persons who have had typhoid fever a number of weeks or months before and who still continue to throw off virulent disease germs in the wastes of the body. A state law makes stream pollution a misdemeanor, and vigilant vacationists can greatly aid in its enforcement.

"Protecting the campers on the stream below is simply a matter of making it impossible for wastes of the human body to drain into the water. A good substitute for a toilet vault is a bucket or oil can partly filled with dry earth, all contents to be covered with dirt or ashes and finally buried. Or dig a pit a safe distance from the stream and keep contents covered with fine dirt. Either of these devices will also prevent the breeding of flies and the carrying of intestinal diseases by flies, and will serve to keep the woods sweet and clean. An odorless and fly-proof camp kitchen drain can be made by thrusting a length of stovepipe down a squirrel hole or rotten stump, tamping damp earth around the base, and capping it with a bit of board. Water from wash-tubs can be poured in sump-holes dug in sand bars."

VALUE OF YOUNG GROWTH.

In an action for fire trespass on the Black Hills National Forest brought by the United States against the Missouri River and Northwestern Railroad, the jury has awarded damages to the Government not only for the loss of merchantable timber but also for the destruction of unmerchantable young growth.

This is regarded by Government officials as establishing a very important precedent. So far as is known at the U. S. Department of Agriculture, it is the first time that any court has recognized what foresters call the "expectation value" of young growth as furnishing a basis for the award of damages. The difficulty in the way of such an award in the past has been that there was no way to prove to the satisfaction of the courts the money value of the loss suffered.

The award in the South Dakota case followed the presentation of evidence as to the cost of work in reforesting which the government is actually doing in the Black Hills. The amount claimed for the young growth burned was $12 an acre, and the claim under this item was allowed in full by the jury. The total amount of damages claimed was $3,728.85, of which $2,634.45 was for merchantable timber destroyed or injured by the fire.

It is recognized by foresters that the cost of artificial reforestation will not always furnish a fair basis for estimating the damage to forest reproduction. Where new growth can be expected by natural sowing from seed-trees on the ground within a short time, artificial planting or sowing is an unnecessarily expensive method. To meet such cases what are known as "yield tables" are being prepared. By the use of these the loss can be shown in terms of the final crop and the time necessary to produce it.

Thus, if it is known that ten thousand feet of timber per acre can be cut once in seventy years, it is easy to calculate the value of the crop when it is ten years old by discounting from its value when mature. In European countries where forestry has been long practiced this method is regularly applied in selling, condemning, or estimating damages on forest property. It is also used abroad in insurance, which would be impracticable if there were not both an accepted basis for determining the loss suffered and a reasonably accurate knowledge of the hazard involved.

UNDERGROUND WATERS FOR FARM USE.

The United States Geological Survey has just issued a report by M. L. Fuller entitled "Underground waters for farm use." Mr. Fuller enumerates the various kinds of rocks and deposits that contain and convey underground water, describes the several types of wells and discusses measures for the protection of springs and wells from pollution. The report, which is issued as Water-Supply Paper 255, also contains sections on methods of well boring, the use of cisterns, the divining rod, the advantages of different kinds of wells, and the location and cost of wells. It covers 58 pages and is illustrated by numerous plates and figures.

The Divining Rod.

In speaking of the divining rod Mr. Fuller says, "No appliance, either mechanical or electrical, has yet been devised that will detect water in places where plain common sense will not show its presence just as well. The uselessness of the divining rod is indicated by the facts that it may be worked at will by the operator, that he fails to detect strong water currents in tunnels and other free courses that afford no surface indications of water, and that his locations in regions where water flows in well-defined channels are no more successful than mere guesses. In fact, its operators are successful only in regions where ground water occurs in a definite sheet in porous material. In such regions few failures to find water can occur, for wells can get water almost anywhere."

The report can be obtained without charge by applying to the Director of the United States Geological Survey at Washington.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Grafting Olives.

Can a 10 or 15 year old olive orchard of small undesirable fruit be successfully grafted or budded to larger variety?—Subscriber, Hemet.

Fortunately the above query came to the office at the same time as Mr. Geo. C. Roeding of Fresno called and from him we have the favor of an answer as follows:

"Yes. It is entirely practicable to graft trees ten or fifteen or even fifty years old over to another variety. The most satisfactory method of doing this is to take the tree and cut off all its main branches to within four feet of the point where they diverge from the main stem, with the exception of one which, if it is possible to do it, should be left on the southwest side of the tree in order to shade the grafts during the heated summer months. The time to do the grafting is either during the months of February and March or just as soon as the trees show signs of growing and the bark will lift readily. We never use scions smaller than one-fourth inch in diameter and up to three-eights inch. The number to be inserted depends on the size of the stub to be grafted. As a general rule the scions should be placed about two inches apart.

"Cut scion just as you would do or wedge graft, except that the cut should only be made on one side. Make an incision in the bark on the side of the stump, following the same method as in budding excepting that the horizontal cut is left out; lift the bark with the edge of the knife just as you would do in budding. This will permit the scion to be slipped in readily beneath the bark. When this work is completed and the number of scions inserted, wrap the stump with cotton twine using six-ply or if the stumps should be ten or twelve inches in diameter, single strand rope could be used to advantage. Be careful to wax over the top of the stub and all around the sides as far as the cut has been made. Use liquid grafting wax for this purpose.

"If all the scions grow so much the better. Do not disturb them for at least a couple of years or even three for that matter, until the stub has been entirely covered with a new growth of wood. This will insure a perfect union. This method of grafting will bring better and quicker results than any other that can be followed."

lfalfa Tea for Calves.

Please give the manner of prepar- alfalfa tea and method of raising es on skim milk.—Subscriber.

epare alfalfa hay tea by putting water on a quantity of alfalfa es. The floor of the barn mow plenty of loose leaves that are for this use. We usually allow -quart can full of leaves to each of water. Steep it the same y other tea. We prefer to use y with it as the wheat bran is much on the protein order to as well with alfalfa hay as rolled barley. This is cooked into a mush. Bring it to a boil and then bury it in a hay box so that it will cook all day. If one pint of rolled barley is cooked in a full quart of water in a tightly-closed can the mass will be a mush. To each quart of the hay tea add at first a teacupful of milk and a teacupful of the mush. Gradually drop out the milk and increase the tea to cover the amount withdrawn. We would be very glad to hear this gentleman's experience in raising calves on clover tea in the East.—M. E. S.

Indian Runner Ducks.

Where may I secure White Indian Runner ducks' eggs, also when is the proper time to incubate them?—Subscriber, Fresno.

From the keen inquiry for Indian Runners we imagine the poultry people are missing an opportunity in not announcing their stock in the columns of the Cultivator. This breed seems very popular, and justly so.

Sugar Beets in Imperial.

What is the best time of the year to plant sugar beets in Imperial Valley, and will they grow in salty ground?—Subscriber, Holtville.

Sugar beets will endure considerable alkali, and we doubt not will the common salt that prevails in some parts of the Imperial. Some planters on alkali ground maintain that sugar beets reduce the alkali and make the soil acceptable to other plants. As you do not give the percentage of alkalinity we cannot answer you definitely. In any case, actual test is preferable. As to the time of planting, we cannot say definitely, but would suggest very early, possibly December or January.

Possibly Persimmons.

I send leaves and bark from trees on place just purchased. Can you tell us the variety and whether they are worth preserving?—Subscriber, Santa Ana.

Only the merest guess is possible, but from shape of the leaves and appearance of the bark we would say that they may be from persimmon tree. As to whether it is a good variety and worth preserving only testing can tell. Leaves with blossoms or seed would enable a botanist to determine definitely.

Fumigation.

I have a few orange trees infested with scale. How may I fumigate, as I am not located where I can obtain services of professionals?—Subscriber, Pasadena.

The only requirement is a perfectly tight tent or other enclosure that will hold the gas for an hour or more. Then secure a good quality of cyanide of potassium and sulphuric acid. Use in proportions of one ounce of cyanide, one ounce of sulphuric acid and three ounces of water. The acid and water should be placed in a vessel under the tent after it is arranged so as to be practically gas tight, then at the last moment drop in the cyanide. Use in the proportion of one ounce of cyanide to each 100 cubic feet of space. The work is to be done at night, or at least when the sun is not shining. It

EUCALYPTUS TREES

Unsolicited Testimonial Just Received from Large Ranch in Kern County:

"The Eucalyptus trees arrived in excellent condition; and were the thriftiest, stockiest, and altogether the finest trees ever received on this ranch"

We have large stock 18 months' old trees for early planting, and also 9 months' old for later planting: to see the stock will convince anyone of its quality and hardiness; prices right.

Unsolicited testimonials just received from well known experienced horticulturist: "The fruit trees you sent last year did well and are the admiration of the neighborhood." (Names given if desired)

done in the early part of the evening and allowed to remain over night no harm is done. This strength is sufficient for black scale. For purple scale or mealy bug a 25 per cent. stronger dose may be used.

Gum Disease.

I send bark from sick orange tree. Looks like gum disease except that it is confined to upper part of trunk and larger branches. The new green bark replaces the old more readily than with the regular gum disease.—Subscriber, Lakeside.

This we think is nothing more or less than the ordinary gum disease and the usual treatment with neat's foot oil and slitting of bark and correcting soil conditions is all that is needed.

White Scale.

I send twigs covered with small white insects. What are they and what is the treatment?—G. H. H., Lakeside.

These are young and very small white scale, sometimes called cottony cushion scale. Apply to the State Horticultural Commissioner at Sacramento for colony of novius cardinalis. If direct treatment is preferred, spraying with any of the ordinary soap sprays will reduce it.

Peonies in California.

Why are not peonies grown in this state?—J. C. C., Los Angeles.

The Cultivator quoted from an Eastern paper in last week's issue an article on peonies as a matter of general interest, but we must say they have as a rule done poorly in California. Our arid conditions seem to be against their best development. Near the coast where warm and moist and grown under shade, they do fairly well. Magnificent specimens have been grown in glass houses where moisture conditions could be controlled. California's direct sunshine is, however, too intense.

Clearing Off Ferns.

Please tell me how to clear land of heavy growth of ferns? They are the large kind six and seven feet high and completely cover the ground.—Subscriber, Ferndale.

We know of no better way than hand work with such a problem. Presumably the ground is so moist that there would be even at this season of the year practically no dry material so that they could be burned. Of course, chemicals like salt and acids or a strong solution of sulphate of iron might help, but it might also seriously injure the soil for any other crop. They may possibly be mowed off and allowed to dry, later burning off and plowing under. Have our subscribers experience? This is an absolutely new problem to us.

Mating Turkeys.

In mating gobblers with hens is it advisable to mate from same brood? Have fine young gobblers and would like to use them unless it will be inbreeding too much. They are from large flock so only a small percentage would be full sisters. How many toms are required for 50 hens?—J. H., Pixley.

If this is the first year of inbreeding, it would probably be all right, but you should know something of the history of the flock and if good fresh blood has been used previously, you will probably have excellent results for another year. One male is sufficient for 18 or 20 hens.

VETERINARY

Answers in this column by Dr. Fred G. Matthews, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Garget.

Would you please tell me what to do for a cow, which has one teat larger than the rest. There seems to be a bunch at the base of this teat, in the udder, and blood sometimes comes with the milk. The teat is sore, at times, and causes restlessness while milking.—Subscriber, Modesto.

Garget may be treated by applying Iodine Petrogen twice daily after milking. Gentle hand rubbing will hasten and insure penetration of the medicine, and will encourage the absorption of the bunch. Care should be exercised, however, in the manipulation as too vigorous handling of the part might result in congestion of the udder. It may be well to start treatment by giving one pound of epsom salts, dissolved in one or two quarts of water, as a drench and follow with one tablespoonful of hyposulphite of soda in the feed twice daily.—F. G. M.

Treatment for Bloat.

J. H. R. of Yuma, asks in a recent issue for a cure for bloat and I wish to tell of a remedy we use here with perfect success.

Procure about five feet of ordinary rubber water-hose and when you find one of your animals bloated, no matter how badly, grease the hose, insert in the mouth, push gently down the throat until you reach the stomach, which can be told by the presure of escaping gas through the hose, which will often be so violent as to swing the hose from side to side, and in a few minutes the animal will get up and go to feeding and will be as well as ever, but of course it is as well to be a trifle careful of the feed for a day or two, and if possible give them a change of diet such as a few feeds of dry hay, and you will have no further trouble.—Mrs. J. H. Rothwell, Mesa Grande.

Matted Tail.

I have a young horse which seems to have a beautiful tail, but the hairs are matted very tightly. Do you know of a remedy to correct the condition?—Subscriber, Winters.

Medicines will not separate the entangled hairs. Use a "mane and tail comb," or a blunt, round-pointed awl and carefully comb out every matted bunch. A little vaselin worked into the hairs will aid in preventing the recurrence of the trouble. The condition is common in horses which are not regularly groomed, such as horses at pasture, etc., and cannot be attributed to disease.—F. G. M.

Indigestion and Scours.

One of our horses has indigestion or scours. Would you kindly tell us what to give him?—Subscriber, Clovis.

Feed old barley hay and a moderate quantity of grain and regulate the amount of water given. Allow for access to salt. Mix in the feed, twice daily, one tablespoonful of a mixture of equal parts of powdered chalk, baking soda, ground ginger, gentian root and dried iron sulphate. —F. G. M.

Imperial Valley has ginned about 1500 bales of cotton.

This is the Troutman Orchard Heater and here is a copy of letter received from a well-known grower and manager of an orange association, whose name you can have for the asking and who has ordered the Troutman heaters for his grove:

Highgrove, Nov. 25, 1910.
Mr. W. H. Fowler,
Los Angeles, Calif.
Dear Sir::—

"Beg to say on our last test of the Troutman Heater we had three pints of oil remaining when we fired up the stove at night, and this amount of oil burned two hours and twenty-five minutes, giving at all times a uniform flame and even heat.

"In morning I began to cast about for some evidence of soot on trees and fruit, but was unable to detect any on either; found some minute particles on top of newspaper that you had the heater wrapped up in."

and in reply to my question asking if I could publish his letter as a testimoni he further says: "While I did not write for publication, what I said in referer to the heaters is the result of my own personal observations and are facts whi convince me that the Troutman Heater is the best heater on the market toda

ADDRESS________________

(Continued from Page 531)

according to all scientific theories. This is another of those contradictions. Facts show this to be true, while actually the mildew spores should not be on the vine and neither should the vine is disinfected so that it does not form a good ground for mildew attacks. The matter must be left at the present state of our knowledge without explanation. The vine sprayed with Bordeaux does not need any sulphuring, as a rule, in Fresno county Sometimes here is a year when the mildew is extreme and persistent attacks occur, when it is necessary to use a little sulphur in the summer as a dust on the vines. I have sprayed and used no sulphur more years than have used the sulphur. The years used it, I only needed it in small, pecially damp places.

Sprays.

The lime and sulphur now comes in the convenient form of Ortho or Rex. Either are good, and to be preferred to an attempt to make the mixture at home. Bordeaux mixture is cheaper to apply and we use it mostly, as it does as well and the men prefer to handle it. The standard mixture is five pounds of blue stone, seven of lime, to fifty gallons of water. The excess of lime is merely to make the vines show a dress of blue wash, then one can be sure that every part has been reached. The vineyard is always an interesting study, and we are more and more fascinated every year. Cows and horses show their breeding, and go on increasing in either improved or deteriorated forms. The work shows up soon and one knows if he is on the wrong road quickly. The vine or the tree starved, stunted or abused is much longer in coming to full perfection, and never gives the results that the tree or vine gives that has never been stunted. It is the common way to consider that it is only a season's loss of growth if the vines are stunted by insect pest or lack of care. I doubt this thoroughly, and also believe that inheritance in the plant life is even stronger than in animals. The cuttings from a stunted vine will not make as good a vineyard as from a vigorous producing one.—M. E. Sheridan.

AUTOMOBILES FOR FARMERS.

A man who practices intensive farming in a section where land values are very high recently said he could not afford to have pasture for his horses, and he kept only a minimum number to cultivate his crops. He said he had no extra team, and could not afford to unhitch his horses from the cultivator to go to town. As a result he was forced to the use of an automobile to do his running around.

It was a shrewd man who said this; he has all his feed to buy, and knows how expensive it is to keep horses when they are not working. His conclusions that he could not afford to do without an automobile were reached after careful deliberation, and he has had no reason to change his mind.

We wonder how many other readers have reached the same conclusions?—Green's Fruit Grower.

The Claremont Farmers' Club will meet next week at the home of the President, Prof. A. J. Cook, at Claremont, on Saturday, Dec. 10. The principal matter of discussion will have to do with horticultural commissioners and their manner of appointment. Without question interesting talks will be made and some politically appointed commissioners may get a roast. The club hopes for the attendance of Los Angeles county's full board of supervisors.

HOUSEHOLD HINTS.

Clean the bamboo furniture with a small brush dipped in warm, weak salt water. The salt will prevent the bamboo turning yellow.

To make velvet look like new, dip a brush in clean, damp sand and lightly brush the velvet against the pile, then shake out the sand.

For varnishing leather goods, take equal parts of gum arabic, water and the white of an egg, mix well and apply. If the article is likely to be handled much, the white of an egg with less water than egg will serve.

To remove the grease from the wall paper, mix pipe clay with water to the consistency of cream, spread it on the spot and leave until next day, then brush off. If necessary, repeat.

To remove the iron rust spots quickly, have a teakettle of water boiling on the stove; take the garment dry; cut and squeeze lemon juice. Hold the spot over the steaming kettle spout and the spots should disappear.

For the nickel-plating that has rusted, try covering the spot with muttton tallow and let stand for several days; then follow this treatment with a rubbing with a good metal polish, and then a thorough washing with strong ammonia, rinsing with clear water, and giving a final polish with dry whiting. This is generally effective.

In cleaning the windows, rub them with a cloth dipped in a thin mixture of whiting and ammonia, let them dry and then polish with a soft dry cloth. Don't use soap, as it streaks them.

The more lovable we make ourselves in life, the more we grieve our friends when we die.

The way land is selling now, we shall have to revise the old saying that a thing is dirt cheap.

DON'T PLANT CHEAP
Alfalfa Seed

It isn't cheap. No foul seeds in ours; first-class, carefully selected, and thoroughly re-cleaned. Come and see it, or write for sample and quantity price.

Not weed-foul grass that is half wasted under foot by the stock. We know farmers who would willingly pay as much again to obtain the pure quality of our

Alfalfa Seed

Our recleaning machinery is an investment, and the extra cost to you for our CLEAN SEED is but a trifle. You cannot lose by asking us for quotations.

Germain SEED & PLANT CO.
LOS ANGELES

BUY SEEDS BY NAME

If you were buying apple trees you would rather pay a reasonable price for named varieties, guaranteed true to name by a nurseryman than to buy unnamed trees just because you could get them cheap. Did you ever think of the fact that this same argument applies to seeds? Branded and guaranteed seeds are the safest and in the end the cheapest. There must be quality in every package, for the maker must make good goods or he can't stay in business. When you buy Lilly's Best Seeds, Northern Grown, you buy seeds that are true to name, pure and of high germination.

Don't take chances. Send for catalog. **CHAS. H. LILLY CO., SEATTLE,** for over a decade the leading Seedsmen of the Northwest. No matter where you buy, ask and insist on Lilly's Seeds, and if your dealer does not sell them write to us and we will supply you. Lilly's "Crop" Book is of great interest to **farmers.** Free

LILLY'S SEEDS

General Agriculture

DODDER.

Examination of many samples of clover and alfalfa seed received at the Purdue Experiment Station, has revealed the presence in the seed on our market, of four distinct species of dodder. Since these four kinds distinctly differ from one another in one or two important respects, and at the same time resemble one another in certain other respects, attention is here called in general terms to the different kinds.

Clover Dodder.

This infests clovers and alfalfas. It is found in Europe and other foreign countries producing clover, also in the states east of the Mississippi and in the northern Pacific states. The seed is in general, gray to brown, nearly round, or somewhat flattened; the surface is finely pitted. It is from 1-30 to 1-24 of an inch in diameter.

Large-seeded Alfalfa Dodder.

This occurs commonly in western alfalfa growing states, and is being found in the western alfalfa seed used in Indiana. The larger seeds of this dodder are about the size of the smaller alfalfa seed, and are therefore hard to clean out thoroughly. On the other hand they are smaller than the larger seeded red clover, and should be quite easy to clean from it. The size and shape of the seed is variable, the larger seeds, however, are nearly circular, and are gray to brown in color, sometimes having a slight pinkish cast. The surface is seen, under a lens, to be very rough.

Small-seeded Alfalfa Dodder.

This is very common and destructive in the western states, and has been found in samples examined in the seed laboratory here. This is to be expected as Indiana imports much western-grown alfalfa seed. It does little or no damage to other clovers. The seeds are very small, oval, and owing to compression in the pod, have two flattened faces; the surface is roughened; color, usually yellowish, which may have a tinge of green or purple.

Field Dodder.

This is apt to appear in either clover or alfalfa, whether grown east or west of the Mississippi, and is extremely destructive. Field Dodder seeds are larger than those of Clover Dodder, or of Small-seeded Alfalfa Dodder, notched at the scar, rounded on one side, and variously flattened, angled, or grooved, on the other. They vary in size from 1-24 to 1-16 of an inch in diameter, and are variable in color, being yellowish, purplish, dusty or grayish brown with a decided pink or flesh cast.

Notice that the seeds of all the dodders mentioned here are more or less rough, while clover and alfalfa seed is smooth with a slight gloss. The scar on the dodder seed is much less evident than is that on the clover seeds. Dodder seeds are generally smaller than good red clover seed or alfalfa seed. All who use or handle the smaller farm seeds are urged to procure a good magnifying glass. Such a glass is indispensable in the examination of seed for dodder and other impurities. A tripod lens costing about 50 cents seems to be as
convenient a form of lens as any
the market. As a further means
identifying dodder seed, soak the l
ter in water a few hours, then wi
needles pick a seed apart, and wi
the aid of the lens, find the embry
or undeveloped plant within. In do
der the tiny plant within the see
will be found to be slender, threa
like and coiled.—Indiana Exp. St

THE SULZER BILL.

The Sulzer bill to reduce postal tes, to improve the postal service d increase revenues, introduced at e last session and to be consid- red at the coming session, is as fol- ws:

"The common weight limit of the mestic postal service in the United tates is hereby increased to eleven unds, the common limit of the Uni- ersal Postal Union, and that in the eneral business of the post-office the e cent an ounce rate on general erchandise—fourth-class mail matr—be, and is hereby, reduced to the ird-class rate, one cent for each two nces or fraction thereof.

"Section 2. That the rate on local tters or sealed parcels posted for livery within the free-delivery serves is herby determined at two cents parcels up to four ounces, one nt on each additional two ounces; t nondelivery offices, one cent for ch two ounces.

"Section 3. That all mail matter llected and delivered within the ifferent rural routes of the United tates is hereby determined to be in e class, with rates, door to door, etween the different houses and laces of business and the post-office r post-offices, on each route, as fol- ws: On parcels up to one twenty- urth of a cubic foot, or 1 by 6 by 2 inches in dimensions and up to one ound in weight, one cent; on larger arcels up to one-half a cubic foot, r 6 by 12 by 12 inches in dimensions d up to 11 pounds in weight, five nts; on larger parcels up to one bic foot, 6 by 12 by 24 inches in imensions and up to twenty-five ounds in weight, ten cents. No arcel shall be over six feet in length, d in no case shall a carrier be bliged to transport a load of over 0 pounds.

"Section 4. That on all unregis- red prepaid mail matter without declared value an indemnity up to $10 hall be paid by the Post-Office De- artment for such actual loss or damge as may occur through the fault of e postal service, and this without xtra charge. Certificates of posting hall be provided on demand. On egistered parcels of declared value, n on which the fee for registration, surance, and postage has been duly repaid, the Post-Office Department hall pay the full value of any direct ss or damage that may occur hrough the fault of the postal service. The fees for insurance and reg- stration shall be as follows: For egistration and insurance up to $50, 0 cents; for each additional $50, 2 ents. No claim for compensation ill be admitted if not presented with- one year after the parcel is posted.

"Sec. 5. That all acts and parts of cts inconsistent with this act are ereby repealed.

"Sec. 6. That this act shall take effect six months from and after the date of approval thereof."

AMOUNT OF HAY IN THE STACK.

Comparatively few ranchers have facilites for weighing the hay fed or sold. On large ranches equipped with wagon scales, owners seldom care to go to the trouble of weighing hay. Perhaps no method of ascertaining the weight is more accurate than the old-fashioned way of measuring the square of the stack and the peak separately to get the valume of hay in cubic feet. The rule most generally used is to measure the distance over the stack by throwing a rope or tape from one side to the other, letting it come to the ground. To this distance add the width of the stack in feet. Divide by four to get the square of the end of the stack. Square this number to get the square feet in the face of the stack and multiply by the length to determine the total number of cubic feet.

Another rule is to take one-third the over and multiply by the width for the end surface, then multiply this result by the length. Another is to take the width from the distance over, divide by two for the height, multiply by the width and this product by the length. A rate adopted by one of the Legislatures is to multiply the width by the distance over the stack and this product by the length and divide by four. This last method was investigated by the Department of Agriculture and the result found too small by 30 per cent. A better plan is to subtract the width from the distance over, then multiply by the over, this by the width, this by the length, and the whole product by 0.225, and divide by the height of the stack, which will give the total number of cubic feet. All measurements should be in feet and fractions of a foot.

No two of these five rules bring the same result. For example, the volume of a stack of hay which measures 29 feet over, 15 feet wide, 39 feet long and 9 feet 9 inches high, will by the first rule be 4179 cubic feet; by the second rule, 5655 cubic feet; by the third rule, 4095 cubic feet; by the fourth rule, 4241 cubic feet; and by the fifth rule, 5481 cubic feet. This was an actual case which was settled by the fifth rule, although it made this small stack cost $14.05 more than would have been the case had it been figured by the first rule which is in general use.

This difference is an item of some importance to the producer. It is claimed that the fifth rule gives results with not more than from two to four per cent error. The number of cubic feet of hay required to weigh a ton varies with the kind of hay, its maturity, and how long it has been allowed to settle in the stack. It is generally conceded that five hundred cubic feet of well compressed timothy hay is required to make a ton, and when timothy is first put into stack, or if it is too ripe, coarse, and loose it will take 700 cubic feet. For alfalfa which has settled 30 to 60 days we usually figure a cube eight feet on one side or 512 cubic feet equal to a ton. For fine native hay or alfalfa that has settled six months or more, a cube seven and one-half feet to a side, or 422 cubic feet, is considered sufficient for a ton. Some native hay may be even heavier than this when it is well settled in the stack.—Field and Farm.

HORTICULTURAL PRINTING.

The Kruckeberg Press, 123 South Los Angeles St., Los Angeles, Cal., makes a specialty of Horticultural Printing and Engraving. Cuts and illustrations of all standard, economic and ornamental plants on hand and subject to the use of patrons without cost. Samples and estimates cheerfully furnished. Remember, we design, write, engrave, bind and print; in brief, do the "whole thing," at no additional expense to the customer. Correspondence a pleasure.

DAIRY SUPPLIES.

Have You a Cow?—Have you a creamery? Have you a cheese factory? Write us. Everything used in either a dairy, creamery, cheese factory, or for handling milk, cream, butter, or cheese. We are in a position to quote you prices on entire creamery or cheese-making outfits. We make a specialty of only the latest and best sanitary machinery and supplies. Send us a list of what you want and we will quote prices which we feel certain will interest you. O. J. Weber Co., 225-227 East Sixth St., Los Angeles, Cal.

Milk Coolers, Bottles, Caps, brushes, Buhl milk cans, Sharples separators, Babcock testers, veterinary instruments, wood soled boots and shoes, and our celebrated "Prosperity" washing powder. Guy F. Kelsey, 108 E. 8th St., Los Angeles, Cal.

Business Notes

MAGNIFICENT. AGRICULTURAL LAND.

After fourteen months of preparation, in the adjustment of titles, survey and the many things necessary to prepare a Mexican property for sale to American farmers, we are now ready to open an allotment of 16,000 acres.

Approximately twenty miles southwest from the city of Hermosillo, the Capital of the State of Sonora, and on the Sonora Delta at a point where the Sonora and Pozo rivers come within a short distance of each other. Forty miles inland from the coast of the Gulf of California and in a direct line with the concession granted the Torres and Minas Prietas Railway to be built from Torres, a station on the Southern Pacific to Kino Bay on the Gulf.

The home ranch of the Santa Teresa de La Concordia consists of 16,000 acres of all level land which is divided into sections of 640 acres each and these are quartered where desired.

A little more than 6000 acres is bottom land which can be flooded from the Pozo River. This land is being sold on choice at $10 per acre, easy terms. More than 2000 acres are cleared and are the corn, bean and cotton fields on the ranch. They still have some of the fences, ditches and headgates and the same facilities for farming which existed before the Yaqui warfare.

The remaining 10,000 acres is also bottom land with the same rich soil, but lies a trifle higher and farther from the river. This is being sold at $5.00 per acre, which allows $5.00 with which to build ditches, represses, etc. The price of the $5.00 land will be raised after all of the $10.00 land has been sold.

Land of this class is scarce in any country and will double in value very quickly, and continue to increase in value.

A great deal of land in the United States, where the soil, climate and water conditions are not so good, is selling at from ten to twenty times the price.

With cheap labor, ideal climate and the excellent market conditions the chances for large profits to the producer are much better in Mexico than in the United States and the quick increase in the selling value of the lands will be far greater than is now possible in this country.

There are the same opportunities in Sonora today that existed in Southern California a few years ago.

The City of Hermosillo is a larger and better town now than was Los Angeles twenty-five years ago.

The present water conditions and the chances for developing water are better than existed in Southern California at the same stage of development.

Parties will leave Los Angeles at least once a week. One way fare is $28.40. The round trip with our parties is $37.90. sixty-day tickets. Train leaves at 7 P. M. and arrives at Hermosillo 4 A. M. the second morning. See Ben W. McCloskey & Co., 700 Union Trust Building, Los Angeles.

SPEEDY MAXWELLS.

Thanksgiving Day witnessed a great race with racers and fast road machines on the eight mile road course at Santa Monica, Los Angeles county. The American record was broken and more than 74 miles averaged per mile for the the 101 mile race. Even the light car race showed some wonderful speed, the pace set by the winner being so fierce that it was the only car to finish the 101 miles. The time made was one hour, 42 minutes and 32 seconds. The winner was a Maxwell. We assume that few Cultivator readers will have need of such speed, but pride in the ownership in such a machine is worth consideration when purchasing. The Maxwell is an all around magnificently built machine for every day use. With it all it is now claimed that it is cheaper to use than the horse and buggy. Feed is an expensive item; the automobile does not need it.—Full particulars of this machine may be had by writing the Maxwell-Briscoe Manufacturing Co., Pery St., Tarrytown, New York, and we doubt not an interesting illustrated booklet will be mailed for the asking.

Household Department

PA'S BOY.

When pa was just a little boy,
  Gee, how he ust to work,
He sawed the wood an' built the fires
  An' never tried to shirk.
He always filled the reservoy
  And swept the porches, too;
N' I guess there wasn't many things
  Pa didn't ust to do.

Now ma gets up and builds the fires;
  She says I am too small—
An' sweeps the porches an' the walks
  An' doesn't mind at all.
She says she's glad to let my pa
  His morning nap enjoy,
Because he's tired with all the work
  He done when he's a boy.

When I get big I'll get a wife
  Edzactly like my ma;
To do the chores an' let me sleep
  Just like she does my pa.
An' when I've had my mornin' nap
  You bet that I'll enjoy
To tell 'em how I ust to work
  When I's a little boy.

—Elizabeth Clarke Hardy, in Wisconsin Agriculturalist.

THE RESOURCEFULNESS OF SUE.

Sue was a typewriter and Ethelinda sold lovely laces in a big shop. They lived in an apartment that had plenty of closet room—five rooms and bath, to be exact. Sue usually stopped on the way home and bought two lamb chops and a head of lettuce, if it was the beginning of the week, or five cents' worth of stew meat and no lettuce, if it was toward the tag end of the week, near pay day. Sue was generally the one to negotiate the purchases because she left the office at five and came up town on an express train, while Ethelinla's shop didn't close until six.

Now, upon a certain evening they had invited Marie and Ralph to dine with them. They could say "dine" because they intended to turn in the necks of their shirt waists and wear their near-Brussels lace collars and because Marie was going to bring over her finger bowls. It behooved Sue to shut up her typewriter on the very stroke of five, therefore, even if the manager passed her the glance frappee, and make all possible speed to the express train.

She had the list of dinner items complete. Chops, bread, lettuce (oh, this was Monday evening), corn on the ear, a meringue pie and some berries for desert. She looked like the Goddess of Plenty as she reached the door of the flat house.

She had to put down the chops, the bread and the lettuce on the floor of the vestibule while she dug in her bag for the keys.

Keys? Keys? Here was her penknife, her handkerchief, a pencil, three hairpins, some chewing gum, a powder puff, a nail file, a mirror and her list of dinner supplies—but no keys. Clearly she must have left them at the office in her hurry. Now, here was indeed a pretty how-de-do!

Ethelinda wasn't due for an hour, the guests were apt to come along any minute, and she had ordered the grocer to send around the four bottles of "ice cold" right straight away, and now she couldn't even get in to open the dumbwaiter door.

It was comparatively easy to collect the pie, the chops, the bread, the lettuce and the berries and go down through the cellar and up the four flights of stairs to her apartment door. But then what? She sat down on the stairs and thought some more. There were two flats on a floor. She could ring the bell of the next-door lady and beg to let her climb out her kitchen window, across the fire escape and into her own kitchen window. Fine! Whereupon she rang. No answer. Lady away. Lovely! Now what? And time was flying. There was but one other way. The flat just over theirs was vacant. She might get into that if the door was open, go out the kitchen window, and down the fire escape to her own.

She carefully deposited the chops, the berries, the corn, the lettuce, the pie and the bread upon the floor and started upstairs. The door of the empty flat was unlocked. Ah, joy! She rushed to the kitchen window and gazed down through the fretwork of the fire-escape to the street. My! It was a long drop if she slipped. Furthermore, the ladder was a rusty old thing, and as the flat house was at the corner of the block, the fire escape hung to the outer wall of the building. The openings in the iron platforms at each floor were right over each other, and offered a clear drop, if anything happened, straight to the areaway. She hoped she'd fall nice and plumb into the area, and not out on the sidewalk, where everybody passing by would have to see her all mussed up.

She stepped forth courageously, desperately, and put her foot on the iron ladder. It seemed firm. She tried not to look down in the street, but she couldn't help noticing a man driving a sprinkling cart. He gazed up in her direction and shouted, pleasantly: "Oh, I say, Maude, the water's fine. Drop in!"

Two small boys playing ball in the street yelled at a companion a block away: "Hey, Chimmie hurry up! Pipe de lady burglar!"

"Oh, you blue stocking," remarked a college youth from across the way. And two men who were repairing the street stopped their steam roller and called out: "Don't jump! We'll save you!"

The ladies in the tenement opposite nearly fell out of their respective windows in their enthusiasm over the unusual spectacle. The grocery boy from the corner store dropped a barrel of potatoes on the grocer's foot, the driver of a delivery wagon paused with his parcels slipping from his arms—and all because a desperate young person was descending a fire escape. It seemed to Sue to take an hour at least to get to the platform outside her own kitchen window. Her hands and dress were red with rust, and her hat was on one ear. She ducked hastily into the open kitchen window with a triumphant cry—into the arms of the amazed Ethelinda.

"Sue!"

"Ethelinda!"

"You frightened me nearly to death! What on earth—"

"I'm not on earth. I'm in the air. What are you doing home at this hour, Ethelinda?"

"Why, the store has begun closing at five. I thought I'd hurry home and help you get dinner."

Some young men are foolish enough to spend their money just to convince somebody that they have it.

THE BEST
CHRISTMAS
PRESENT
FOR
$1.75

52 SPLENDID WEEKLY NUMBERS
one after another
the year round

THE LARGER YOUTH'S COMPANION offers an unusual investment in "only the best" reading for every week in 1911—300 Brilliant Stories; Popular Papers by Famous Contributors; Splendid Serial and Adventure Stories the Year Round; 2000 Bits of Wisdom, Wit and Humor.

Every week's issue will be packed full with helpful suggestions—for Girls at home, at college; for Boys in their sports, hunting, fishing, etc.; for the Family in making the home more comfortable and attractive.

1911 Art Calendar Free

AND ALL REMAINING 1910 ISSUES

HOW TO GET THEM

EVERY NEW SUBSCRIBER who at once cuts out and sends this slip (or the name of this publication) with $1.75 for the 52 issues of The Youth's Companion, will receive Free SD 198
ALL THE ISSUES for the Remaining Weeks of 1910, including the Thanksgiving and Christmas Holiday Numbers; also Free
THE COMPANION ART CALENDAR for 1911, lithographed in 12 colors and gold—an extra copy being sent to every one making a gift of a Christmas subscription.
THEN THE YOUTH'S COMPANION for the 52 weeks of 1911, reading equivalent to twenty-seven 300-page volumes of romance, adventure, science, travel, etc., costing ordinarily $1.50 each.

THE YOUTH'S COMPANION, BOSTON, MASS.

ENTERPRISE

Meat and Food Chopper

The *only true Meat Chopper*—the only chopper that has a sharp, four-bladed steel knife and perforated steel plate that *actually cuts* meat, fish, vegetables, fruits, bread, etc, *without crushing or mangling.*

The "ENTERPRISE" is the strongest chopper made—has the fewest parts—is the simplest in construction. Easily cleaned. Cannot rust.

For Sale at Hardware and General Stores Everywhere.

No. 5, Small Family Size Chopper, $2.00. No 10 Large Family Size Chopper, price, $2 75.

"ENTERPRISE" Meat and Food Choppers are made in 45 sizes and styles for Hand, Steam and Electric Power. We also make *cheaper* Food Choppers, but recommend the above. *Illustrated catalogue FREE.*

Sausage Stuffer and Lard Press

The quickest way, the easiest way, the cheapest way to make the best sausage and lard is to use the "ENTERPRISE" Sausage Stuffer and Lard Press—two machines in one. It is an absolute necessity at butchering time.

It is strongly made and every part does its work without a hitch. Plate fits perfectly and cylinder is bored absolutely true. Pressure will not cause meat to rise above plate. The patent corrugated spout prevents air entering the casing, thus assuring perfect filling and preservation of sausage.

Can be changed into a *Lard* or *Fruit Press* in a jiffy.

Sold by Hardware Dealers and General Stores everywhere.

Write for catalogue.

Bone, Shell and Corn Mill

A necessity to farmers, poultrymen and all who keep poultry. A splendid general, all-round mill. Grinds poultry feed and makes bone meal fertilizer.

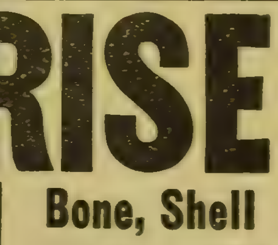
Grinds dry bones, oyster and other shells, corn, etc. Pays for itself in a short time. Size shown in illustration (No. 750, Price $9.50, weight 60 lbs.) grinds 1½ bushels corn per hour.

Look for the name "ENTERPRISE" *on the machine you buy.*

We also make other household specialties—all bearing the famous name "ENTERPRISE"—Coffee Mills, Raisin Seeders; Food Choppers; Fruit, Wine and Jelly Presses; Cherry Stoners; Cold Handle Sad Irons, etc., etc.

Ask for them at Hardware and General Stores.

Illustrated catalogue on request.



The "Enterprising Housekeeper" is a valuable book containing over 200 selected recipes as well as numerous kitchen helps. Sent anywhere for four cents in stamps.

THE ENTERPRISE MFG. CO. OF PA., Dept. 61 Philadelphia, Pa.

⁂

Newell Mathews Company
200 North Los Angeles St. LOS ANGELES, CAL.

RECIPES.

From various exchanges we pick up the folowing. They look good, try them and report.

Fig Sandwiches.

Chop one-fourth pound of figs very fine, add one-fourth cupful of water, and cook to a smooth paste; add also one-third cupful of almonds, blanched, chopped fine and pounded to a paste, with the juice of half a lemon. When cold, spread the mixture upon lady fingers or small cakes. Raisins or dates may be used in place of figs, and bread may be used in place of the cake.—Country Gentleman.

Split Pea Soup.

Wash and soak over night one cupful of split peas; cook till tender, then put through sieve; return to water in which they were cooked. Dice fine one-fourth pound of bacon. Fry slightly, but do not brown. Add to the peas with one teaspoonful of salt and one-fourth teaspoonful of white pepper. Cook twenty minutes; add water until about one quart and a half; add one cupful of milk. Bring to a boil and serve.—San Francisco Call.

Egg Pudding.

Put one quart of milk in a double boiler and let come to boil; mix nine tablespoonfuls of flour with one pint of cold milk and stir into the boiling milk, and let remain on fire until well cooked. Beat the yelks of one dozen eggs, six tablespoonfuls of sugar and three of melted butter. Take boiler from fire, stir in the eggs, sugar, etc.; beat the whites of the eggs and stir in. Butter a pudding dish, pour in the mixture, set the dish in a pan of hot water and bake one hour in a moderately hot oven. Serve with lemon sauce.—Physical Culture.

Chicken Gumbo.

Fry a young chicken brown, and boil one pint of okra fifteen minutes, adding after the first ten minutes four ears of corn, cutting the kernels from the cob, but cooking the cobs with the okra, in order to get their juices. Put the chicken in a porcelain-lined pot, adding corn, okra, four large tomatoes, peeled and sliced, one pod of sweet, red pepper, and a cupful of thickened gravy. Add a pint of boiling water and cook gently for an hour. Take out the chicken bones, strain, then add a quart of rich milk, a pint of fine white bread-crumbs, a large cupful of the chicken breast finely chopped, and, if desired extra good, one cupful of blanched almonds ground fine. Bring quickly to a boil, stirring frequently, and serve at once. —Bridgeport Republican.

Grape Sherbet.

Mix together a quart of grape juice, two cupfuls of orange juice and two cupfuls of sugar. When the sugar is all dissolved, turn into a freezer and freeze. When half frozen, take out the dasher and mix well in the beaten whites of two eggs. Pack and set away to harden.—Greenfield Gazette.

USES OF THE LEMON.

Few people realize the many uses the lemon can be put to.

As a hair wash and tonic it has no rival. For the former purpose a large, juicy lemon should be cut in half, the head dipped in a bowl of water, from which the chill only must be removed and the water made the same temperature as the air, and the lemon rubbed and squeezed vigorously among the roots and along the length of the hair. Soak and rub the hai well in this bath, and then rinse tho oughly in fresh water of the sam warmth. If well dried at once wit energetic toweling, there will not b the smallest danger of cold. No soa is needed.

The acid of the lemon absolutely r moves all grease and dust, and th hair after such a bath is soft, gloss and clean. This lemon bath once week will have the most benefici effect on the hair, stimulating i growth, delaying the coming of gra ness and making it beautifully pliab and polished.

For manicuring the lemon is ab lutely indispensable. A teaspoonf of the juice in a cupful of tepid wate whitens and supples the nails and r moves all grease and dirt, makin them much more easy to polish. Thi should be used every morning, and b dabbling the fingers a few moment it is possible to make the nails pe fectly clean and transparent, withou the use of a cleaner, by simply ru bing them with a towel.

It is also most beneficial in remo ing the skin around the nail edge which should never by any chance b cut with scissors. Rub the tow firmly all about the nail, pushin back the skin; do this regularly ever day, and after a few weeks the ski growth will disappear and never r turn as long as treatment is co tinued.

Women with faultless skin say the have never used anything else. The keep a bottle of lemon and glycerin with them as they do their toile articles and it is rubbed in the ski every night after the face has bee made thoroughly clean.

One should be careful to get th best glycerine and have it well d luted with rose water. This gives i just enough perfume. Neither of thes liquids will cause a growth of hair o the face, and if lemon juice is adde it will whiten the skin as well a prove an antiseptic.

Too much lemon juice is dryin and hardening, and only a few drop are needed to a half pint of the gly cerine and rose water.

HOMELY HINTS.

When the machine has been used fo mincing rather fat meat, run a crus of dry bread through it. This wil remove a good deal of the grease, bu the mincer should afterward be wel washed and scoured.

A piece of camphor kept with the silver which is not in constant use will keep it from tarnishing.

Do not keep fresh meat in paper, it absorbs the juices. Put it on a plate or other dish and place it as soon as possible in the refrigerator, keeping it there until needed.

When steaming a pudding put it into a cake mold that will fit the steamer, instead of tying it in a cloth. The pudding will be lighter if this is done.

All escalloped dishes are better if made with a good white sauce poured over them instead of the usual way of pouring milk over them and sprinkling with bits of butter.

Instead of using oxalic acid to clean brass and coper utensils try half a lemon dipped in salt. This will cleanse and brighten wonderfully, but should be polished until thoroughly dry before putting the article away.

If a double layer of brown paper is put under oil-cloth on shelves or table it will wear three times as long as if laid directly on wood.

dip a penny or other coin in cold water, and then, with its edge, scrape off paint from the glass.

Stains on china can be removed by rubbing with salt or powdered bathbrick. These remedies can also be used for cleaning an enameled saucepan that is stained or burnt.

A good clock is a necessity in any kitchen; without it one is apt to have meals a trifle late, and there are countless reasons why a good clock should be found in the kitchen if anywhere in the house.

When starching anything which has a frayed edge, fold the article in four, and gather the fringe tightly into one hand; hold it firmly and dip the center of the piece into the starch. When dry, shake the fringe well and comb carefully with a coarse comb.

White spots upon varnished furniture will disappear if you hold a hot plate from the stove over them.

A simple polish for furniture is boiled linseed oil. The oil should be boiled the day before it is needed, as it must be entirely cold when used.

If the coarse salt and chopped ice needed to freeze ice cream are mixed together in a separate vessel and the mixture then packed around the freezer can, the contents of the latter will freeze much more evenly. The proportion should be one-third salt to two-thirds ice.

Rice water for invalids is made by boiling one tablespoonful of well washed rice in one pint of water. Strain and add sugar or salt to taste.

Always wrap table or bed linen or any other article of white goods, for that matter, which is to be stored away, in dark blue paper to keep it from turning yellow.

One of the chief reasons why so-called "clear" soup is often cloudy is because every trace of fat has not been removed from the stock. Allow the stock to become cold and solid, then remove all the grease.

THE HOMESICK COLLIE.

Emerson said, "In dealing with children as much soul as you have avails." This is true in treating with domestic animals, especially dogs. Here is an example which tells me so.

I saw a traveler at a railroad station leading a beautiful Scotch collie with a chain around its neck. He told me that the dog was eleven months of age, was born and raised on a farm in southern Indiana, and that he had bought it and was taking it to eastern Pennsylvania.

"But," said he, "I am worried about him. We have been on the road a day and night and I can't make him eat."

He bought at the lunch-counter a few slices of bread with milk poured over them and took them on a wooden picnic plate outside to see if he could coax "John" to eat. But the dog turned his head away and looked wistfully out of the station shed down the shining steel rails. Then it was that I thought of Emerson's remark, and I asked if I could try to induce the animal to eat. The privilege was granted, and I squatted and called,

"John, come here, I want to talk with you."

John came over and laid his head up near my face, and I said,

"Poor boy! I know your trouble. You are so homesick. You want to see the cows and the children, don't you?"

He put his head on one side and seemed to be drinking in every word. His eyes were deep and soulful.

"I know just how you feel, for there have been times when I wanted to see the cows, the green fields, and the children. And then the sights and sounds are all so strange to you, John. You feel as queer and lost as a child would who had been taken away from home, don't you? But, dear, you must eat, for you have a long, long journey before you. Come on over there with me and I'll feed you."

And so he followed me and ate the whole supper from my hands. As I looked up I saw there were men around us with tears on their faces. —Dumb Animals.

THE WORLD'S BEST SELLER.

"Six million six hundred and twenty-four copies," is the report of the British and Foreign Bible Society's sale of Bibles for last year. Moreover, the same organization estimates that during the 106 years of its existence it has issued no less than 222,000,000 copies of the Scriptures—a record that undoubtedly stands unequalled in the history of book publishing. As showing where the Bible circulates, the British Society estimates that "if the Bible Society could gather together representatives of all the nations and peoples for whom it has provided the Word of God in their mother tongue, every continent would send its delegates—75 from Europe, 152 from Asia, 103 from Africa, 32 from the Americas, and 62 from Oceanica—424 in all." And the sale of the Bible is steadily growing; sales last year were 685,000 in excess of the output in the previous year. When one remembers that these figures represent the activities of only one Bible Society and that a work of similarly immense proportions is carried on by organizations of the same kind in this country and elsewhere, the vitality of the Bible as a "best seller" becomes sufficiently apparent.—New York Times.

MIXED PICKLES.

Chop and mix well together the following: One gallon dry onions, one head of cabbage, one gallon green tomatoes and one-half a dozen green peppers. Place them in a thin muslin bag and allow them to drip till reasonably dry. Turn them into an earthen jar and add two tablespoons of salt, one tablespoon of ground cinnamon, a tablespoon of whole cloves and two tablespoons of ground mustard seed. After mixing well add a half cup of sugar and a cup of finely grated horse radish. Allow this mixture to stand for an hour and pour over it enough hot cider vinegar to cover the mixture, then place in jars, leaving space for fresh vinegar to be added if necessary the following morning, when the jars may be sealed and the mixture set away till needed.

Success doesn't come so fast, you know,
Unless you "plug."
You've got to work to make it go,
So "plug."
From Monday morn' till Saturday night,
Get in the game, get in it right,
And do the work with all your might,
Just "plug."

Sure, we must fight if we would reign,
So "plug;"
If you fail one time, try again,
And "plug."
Don't only draw your breath and pay,
But make the "boss" look up and say,
"He's gettin' better every day
Because he'll 'plug.'"

The man who can keep his money will soon have money to keep him.

Away with mystery!

You have a right to know what your roofing is made of. That's the real way to make sure it will last.

Genasco
Ready Roofing

is made of Trinidad Lake asphalt—Nature's everlasting waterproofer. You know this natural asphalt will last in a roof.

The Kant-leak Kleet insures against leaky seams. Does away with cement. Supplied with Genasco, when specified.

Look for the trade-mark at your dealer's. Mineral and smooth surface. Insist on Genasco. A written guarantee—if you want it. Write for samples and the Good Roof Guide Book.

Hay.

We have received on the San Francisco market during the current week 3100 tons of hay, which shows a decrease of about 35 per cent from last week's arrivals.

It has been a good thing for the market that arrivals of hay have decreased to such an extent, for the reason that if the heavy shipments had continued to come forward into our markets, it probably would not have been possible to have maintained the present range of prices.

An occasional carload of strictly Fancy Wheat Hay, or strictly Fancy Red Oat Hay will sell in a small way at top prices, but outside of that the entire market is dull and slow, and prices are weaker and lower than they have been heretofore. No' different state of affairs could have been expected under the present condition of trade. There has been very little hay sent forward on shipping orders, and the local trade being quiet has caused a thorough dullness in all branches of the business.

Alfalfa hay appears to be in a little better favor, and apparently there is a firmer tone to the situation on this article.

We quote the wholesale prices in round lots on today market as follows, viz:

Fancy wheat	12.50@13.50
No. 1 wheat or wh and o	10.50@11.50
No. 2 wheat or wh and o	9.00@10.00
Choice tame oat	10.50@11.50
Other tame oat	8.00@9.50
Wild oat	8.00@9.00
Stock hay	5.50@6.50
Alfalfa, ton	9.00@11.00
Straw	40@50

Grain.

Wheat, No. 1	1.45@1.50
Barley, fancy	1.03¾@1.05
Barley, good to choice	1.01¼@1.02½
Barley, poor to fair	95@1.00
Oats, white	1.45@1.55
Rye, new crop	1.47½@1.52½
Alfalfa seed	18@20
Mustard brown	4½
Millet	2¾
Flaxseed	5@5½
Broom corn seed, per ton	23.50

Feed Stuff.

Bran, per ton	30.00@32.00
Feed cornmeal, per ton	36.00@37.00
Cracked corn	36.00@37.00
Ground barley, per ton	22.00@24.00
Rolled oats, per ton	29.00@31.00
Middlings	34.00@36.50
Oil cake, per ton	40.00@41.50
Cocoanut cake, per ton	25.00
Mixed feed, per ton	25.00@27.00
Shorts	31.00@32.50

Deciduous Market

SACRAMENTO, November 26th, 1910.

The following circular of the California Fruit Distributors gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, November 25th, 1910:

Grapes:. 41 cars.

Shipments of this week have been slightly in excess of expectations and the end is not yet. There will be a few small shipments next week and practically all will be Emperors.

Citrus Market

LOS ANGELES, Nov. 30, 1910.

The auctions have been disposing of some Navels at exceptionally low prices, but these are the off-sizs or off-colored stuff which went in too freely for a short time. On the whole Navels are commanding fair prices. Shipments at this time are of much better colored fruit and also sweeter than the earlier ones. Southern California shipments which have started are found to be much farther advanced both as to color and sweetness than last year at this date. This improvement in quality is gratifying for various reasons, but principally because the consumer with a good taste in his mouth calls for more of the same, and an increase in demand this year with our big output means much.

New York and all other markets are showing greater appreciation of California lemons than ever. There have been times when a very few markets have shown California lemons commanding a dollar or more above Mediterraneans, but within the last week while Mediterraneans were selling in New York for $2.40 and $2.45, Californias commanded $3.45, $3.60 and even $3.65. In a word, California quality was never better than this year. Present quotations are lower than previous ones, but this is simply a drop to regular winter basis. The prices will probably remain about as at present for the season.

Shipments.

Shipments of oranges since November 1st, 1910, are 176 cars, of lemons 390 cars, making a total to date of 566 cars. To same date last season, oranges 185 cars, lemons 224 cars, making a total of 409 cars.

NEW YORK, Friday, Nov. 26.—Three cars of Navels, 1 car of lemons and 1 car of Arizona Navels sold. The market was somewhat lower on Navels, but there was a good demand at prevailing prices, and steady on lemons. It is raining.

BRIGHTS, $1.60 to $2.40; RUSSETS, $1.60 to $2.40.

California Cultivator

Clubbing Price List

FOR THE SEASON 1910-'11

Prices are Good to Oct. 1, 1911

This magazine price list is prepared annually for the convenience and benefit of Cultivator subscribers. The prices given allow our readers the benefit of the lowest figures possible, in return for which, all we require is that to all orders a year's subscription to the Cultivator (class 18) be added at 90c (regular price $1.00 per year).

This year the pricing of various combinations of magazines is a simple matter; all are listed according to class number and this class number multiplied by 5 gives the cost price.

EXAMPLE:

Class No.		Regular Price
20	American Magazine	$1.50
16	Delineator	1.00
37	World's Work	3.00
18	Cultivator	1.00
—		

91X5=$4.55. Club price for all. Amount saved on this club, $1.95.

We desire to especially call attention to this complete list of the most popular magazines. We can, however, supply any periodical published, at the lowest price, and any not listed here will be quoted on request. Let us make you a price on any combination you may desire.

Periodicals in any combination may be ordered to the same or different addresses. Foreign or Canadian subscriptions are extra on account of added postage and prices must be gotten by correspondence. Subscriptions may be either "new" or "renewals," but it is important that this information be given in each case.

Books—Send us a postal for our list of agricultural books which we supply subscribers and which we recommend as most suited to California conditions.

Don't overlook this special:

The California Cultivator (weekly) } Both one year for $1.50
The Rural Californian (monthly) }

Our Money-Saving Combinations:

The price of the Cultivator and any single magazine may be obtained by adding 90c to the class price of the magazine desired.

Make up your orders from the following, noting that the class numbers multiplied by 5 gives the cost price. Also bear in mind that all orders must include a year's subscription to the Cultivator (class 18) at 90c.

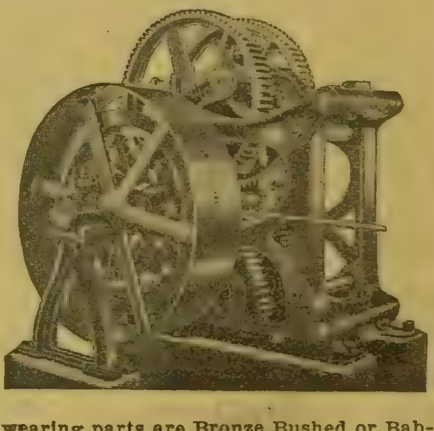
The Smooth Running Pomona Deep Well Pump



RELIABILITY.

Has passed through another most successful season's run, this being the fifth since starting.

There is no experiment in buying a POMONA PUMP. All the parts have been tried out and fully perfected. They will do the work, we know, and do it well.

We have records of plants that have made three seasons' run without one cent for repairs of any kind.

ECONOMY.

May be driven by a steam engine, gas engine or electric motor and in any case will give you the cheapest water and pay dividends on your stock.

Any Water Company going into the irrigation business will run no chances in buying the POMONA PUMP. They are built heavy and strong. All the wearing parts are Bronze Bushed or Babbited and will last a life-time with the smallest outlay for repairs.

We can refer you to customers who are operating their POMONA PUMPS for less than one-half cent per inch per hour on 200 feet lift. This is less than half what their water costs with other pumps. The same make of engine being used in both cases.

Send for illustrated catalogue to—

POMONA MANUFACTURING CO.

The KT Moulds

are the result of years of actual experience in the manufacture of concrete pipe or tile. These moulds are the strongest on the market and the locks are so simple and easily operated that four men are able to make 560 feet of 10 in. pipe in 9 hrs. You cannot get such results from any other moulds on the market. Complete instructions for making pipe furnished free with order. These moulds are fully guaranteed. We also manufacture a complete line of irrigation appliances. Write for our "Brown Book."

MORE WATER —AT— LESS COST

YOU can not only have more water at less cost but you can be entirely independent of irrigating companies. On your land there may be a dependable source of water supply that, together with a simple, powerful I H C gasoline engine will solve the irrigating problem for you.

An I H C engine will pump the water in needed quantities from its source of supply to the place where you want it. It will pump for hours, cheaply and unfailingly; requiring so little of your attention that you can go right on with other work.

I H C Service Bureau

The Bureau is a center, where the best ways of doing things on the farm, and data relating to its development, are collected and distributed free to everyone interested in agriculture. Every available source of information will be used in answering questions on all farm subjects. If the questions are sent to the IHC Service Bureau, they will receive its prompt attention.

I H C Gasoline Engines

are not only the cheapest, most efficient, most dependable power for irrigating purposes, but they save their cost by the other work they will do.

An I H C gasoline engine will simplify the hired help problem for you by running the churn, pump, cream separator, fanning mill, feed cutter, feed grinder, grindstone, washing machine, wood saw, thresher, bean huller, cider press, alfalfa cutter, and other similar machines.

There is an I H C gasoline engine for every section and for all farm uses—vertical, horizontal, —both stationary and portable—engines on skids, —gold medal gasoline tractors,—sawing, pumping, and spraying outfits. Sizes range from 1 to 35-horse power.

Call on the I H C local dealer for catalogue and full particulars, or, address the nearest branch house.

BLOOMS AND FOLIAGE OF THE ACACIAS.

Next to the eucalyptus, the family of acacias are possibly the most important exotics that grace our parks and avenues in the shape of shade and ornamental trees. Being of easy culture, good habit, and suited to semiarid conditions, they have become strong features of a California landscape. Our leader article describes them more fully on the following page.

California Cultivator

Vol. XXXV—No. 23 Los Angeles, California, Thursday, December 8, 1910 Subscription $1 a Year

One of Largest Families in the Vegetable Kingdom

A Tree Which has Wonderful Possibilities in the Golden State.—A Description of a Few of the Sun Blooming Acacias

Approximately four hundred species of acacias flourish in the temperate and semi-tropical zones, and the genus is one of the largest known. California appears to especially favor these plants, for many varieties are grown with success. Widely varied in form and foliage, from dwarfish shrubs to gigantic trees, its jewel-like blossoms varying in complexion from pale lemon to deep orange, some creamy-white and—even although rarely—red, and from tiny globules to long cylindrical spikes, the acacia constitutes one of nature's numerous, splendidly caparisoned beauties of the Golden State.

Volumes can be published anent these interesting floriferous growths; limitation shall, herein, however, be taken to a description of the most popular variations of these arbor gems. Endeavor shall be observed to define as simply yet accurately as possible, and should it be desirable to incorporate botanical terms and phrases exegeses of the same shall be rendered herewith.

The species are divisible into two groups, to-wit: First. The feather or bipinnated leaved, and, second, the phyllodious or simple leaved. Three kinds represent the feather leaved type, i. e.: The mollisima, dealbata and decurrens—to which may also be added the Baileyana. The first two resemble each other so closely that they are frequently confused by gardeners. Nevertheless, each has distinguishing characteristics that are easily noticeable by careful examination and comparison.

From a petiole or leafstalk extend several leaflets or pinnae; from these pinnae radiate several minute parallel rays or pinnules, establishing thus the architecture of the feather or bipinnated leaf, and thereby distinction of the four kindred species is readily attainable. The flowers of this variety are in round heads or globules.

A. mollissima (figure 2 on cover page), as the name implies, is the softest leaved, the pinnules are an oblong-lozenge shape and comparatively broader, more frayed and crowded, overlapping each other slightly, they are more or less mealy. Golden yellow flowers.

A. dealbata, pinnules narrower, less mealy and more remote from each other, leaves present a harder appearonce; the pinnae are also slightly further apart.

A. decurrens, fine, needle-like pinnules, not mealy; pinnae remote and decurrent or drooping from the stem. The preceding three species grow in trees, some of which attain an elevation of thirty-five feet in favored localities.

A. Baileyana, a beautiful small tree, branches curving gracefully sideways; flat, bipinnated leaves; the pinnules are oblong-lozenge shaped, uniformly disposed. The branches and leaves evince a silvery-white, glaucous aspect, due to a fine adhesive white powder. Flowers are yellow heads or globules. This tree, while still uncommon, bids fair by its exceeding grace and grandeur to become one of the most popular of the species.

The simple or phyllodious leaf is constituted by a dilated petiole or leafstalk forming into a blade. The following species are thus endowed:

A. cultrifonnis (figure 6), a handsome, bushy shrub; small knife-formed leaves distributed vertically along the branches; both leaves and branches (like A. Baileyana) are covered with a white, mealy, microscopically fine adhesive powder, exhibiting a silvery-white appearance. Flowers in golden yellow globules in crowded clusters. A gorgeous ornament minus which no garden is complete.

A. Armata (figure 7), Kangaroo Thorn. Spreading spiny shrub six to ten feet high, branches pubescent, leaves small and slightly ruffled, borne all along the branches; fragrant, deep yellow globules. Splendid hedge.

A. verticillata (figure 9), whorled leaf), bushy, spreading shrub, distinguished for its needle-like leaves, one-half inch long. Flowers in yellow spikes one-half inch long. An excellent hedge; will endure trimming indefinitely.

A. longifolia, variety Sophorae (figure 1), small tree or large shrub; bears abundant bright, yellow, handsome spikes or catkins.

A. pycnantha (figure 5), medium size tree, sparsely foliaged, leaves long and very narrow in upper portion, lower half expanding to form one-half to two-thirds of an inch, blade curving into a crescent and terminating in a point. Flowers yellow globules.

CORDYLINE AUSTRALIS.

A handsome palm-like plant, native to New Zealand, with a stout branched stem, and with flag-like leaves from two to three feet long. A strikingly individual plant in many of our parks and gordens.

A. longifolia (figure 4), small tree, flowers long, deep yellow spikes distributed along the smaller drooping branches.

A. cyanophylla (blue leaf tree). A medium size tree bearing an abundance of foliage, drooping branches and large, beautiful golden globular flowers, lance-shaped leaves, dark green in color, faintly besprinkled by a fine, white, mealy powder which imparts a bluish cast; the lower leaves reach a length often to twelve inches, and the upper six inches or less. This tree is frequently misnamed A. saligna, or rather substituted for the latter.

A. neriifolia, or A. retinodes (figure 8), slender branches, small tree, very narrow leaves, flowers light yellow heads.

A. melanoxylon (figure 3, Blackwood), tall, dark foliage, many veined, dark leaves, mostly three to four inches long, thick and stiff; flowers few, creamy-white globules. This is indubitably the homeliest of the popular species and is certainly not recommendable for garden and street culture, regardless of its apparent popularity, when so many finer varieties are available.

Chemical Acacias.

It is undoubtedly of interest to many to learn that the aforementioned acacias are members of the same family from which gum arabic is obtained, with which most of the mucilage of commerce is manufactured. The gum is secured from the acacia arabica vera, a spring species, grown in the desert areas of Senegal and the upper Nile region, where the gum collects spontaneously under the bark, and breaks out through the openings and dries on the surface in the form of round or tear-shaped masses.

Catechu, which is valued in the materia medica as an astringent medicine and in the arts as a valuable tannin, is derived from the acacia catechu, which is indigenous to tropical East Africa.

Tentative culture has not been successful to date in the acclimatization of these drug-producing species in the United States. Sufficient experimentation, however, has not been devoted to justify discouragement nor even comment upon the faculty of these specimens for arboriculture in America.

The bark of the black wattle tree (acacia mollissima, figure 2) has long been in use for tanning purposes. It does not communicate to the leather so fine a bloom as the bark of the American oaks or the acorn cups of the valonia oak, but it tans more quickly and is in good and increasing demand for the common grades of leather.

Formerly the supply of tan bark came from the forests of Australia, but within the last seven or eight years the colonial plantations of Natal, South Africa, have begun to supply a large proportion of the bark and the enthusiastic residents of the colony emphatically assert that wattle growing is the most profitable plant industry in their country.

Most of the acacias grown in California are originally from Australia, but manifestly thrive better in their adopted country than on the continent of their nativity. In view of this fact it may not be long hence when American tanners will be supplied by American husbandmen, and a new industry prosper on the Pacific Coast.

Citrus and Tropical Fruits

ROBERTSON'S REPORT ON CITRUS FRUITS.

Mr. George Robertson, statistician of Fresno county, makes the following report on citrus conditions:

It seems that, as with raisins, the imports of foreign citrus fruits are decreasing, while the exports of domestic fruit continue to increase.

Herewith are given reports on Spanish, Florida and California prospects in the coming season:

Spain.

The latest reports from Spain, dated November 1, stated that the shipments will be small until about the middle of the month. The oranges are of excellent quality, the late rains having greatly improved the fruit. Regarding the size of the crop, in some districts it is good, in others nearly 50 per cent shorter than last year, but is very much finer. The fruit is not coloring so fast, as was at first expected. Prices range higher than last season.

Florida.

Reports received from Florida as late as November 8 state that the reports published in the press that the orange crop had been destroyed by the recent storm were greatly exaggerated.

Last year the shipments were a little over 6,000,000 boxes; this year they are expected to be under 5,000,000, oranges being about 60 per cent short, tangerines about 75 per cent short, and grape fruit a full crop.

In several counties the loss is estimated at only 3 per cent, and reports received from 200 parts of the state would indicate that the damage did not exceed 7 per cent. The storm was accompanied by copious rains, which produced rapid growth of the still unmatured fruit on the trees, which will probably more than offset the loss from the wind. A large orange grower states that the crop as a whole has been damaged very little, and in some instances has been benefited by the rain. In one large grove, where the white fly was very bad, the fruit being almost black, the heavy rains and wind have cleaned the fruit until it looks almost as if it had been through a washing machine, and have added hundreds of dollars to its value. It is also stated that the Florida Citrus Exchange is maintaining a price of $2.25 per box for oranges, and $3 a box for grape fruit f. o. b. packing house. It is claimed that the Florida standard boxes are larger than those used in California, the former containing about ninety-three pounds of fruit, and the latter seventy-four pounds. The fight between the independent shipper and the Florida Citrus Exchange has formally opened for the present season. Competition is unusually keen, and it is believed the efforts of the exchange to ship only ripe fruit and sound fruit will be rewarded as in the past season.

Indeed, at the present time the exchange is getting what it asks for its fruit, notwithstanding its prices are higher. Orders are coming in faster than they can be filled.

Fresno growers, both of oranges and raisins, might study these facts with advantage.

California.

In Southern California it looks as if the crop of oranges and lemons now upon the trees was considerably larger than that of last season, and it is probably the largest crop of citrus fruit ever grown. The condition of the crop at the present time is excellent, and that already forwarded to market from north of the Tehachapi is giving great satisfaction. Southern shipments have not yet begun.

The number of cars shipped during the last seasons has been:

Oranges — 1908-1909, 31,895; 1909-1910, 25,331. Lemons — 1908-1909, 6,196; 1909-1910, 4,782.

Butte County.

The crop in the Oroville district is about the same as last year, there being a shortage of some 5 to 7 per cent in some orchards, with a considerable increase in others. Oranges are coloring well and are in fine condition. The shortage in a few orchards was occasioned by a severe wind, which caused a dropping of fruit in exposed orchards.

Louisiana.

This year's Louisiana orange crop will exceed that of last year by several thousand boxes. The crop is rapidly maturing, and is estimated at from 325,000 to 350,000 boxes.

Fresno County.

The crop is about the same or rather larger than last year. The quality is good, and probably a week or ten days in advance of last year. A considerable quantity of the fruit has been already shipped, which is rather unusual for this time of year in Fresno county. The condition as regards quality and size will compare very favorably with those from other districts.

Imports and Exports.

The value of citrus fruits imported into this country during the last five years has been as follows:

	Oranges, Value.	Lemons, Value.
1906	$456,726	$2,933,990
1907	354,495	4,253,296
1908	275,060	4,388,530
1909	137,390	2,623,399
*1910	57,550	2,690,072

*Nine months ending September.

Domestic Imports.

	Oranges, Value.
1906	$1,110,993
1907	1,255,104
1908	1,577,661
1909	2,131,724
*1910	1,919,017

*Nine months ending September.

FROST PROTECTION.

The unfortunate hurricane which swept over the citrus sections of Florida last month and which did a certain amount of damage to oranges was a condition that could not be anticipated and one which no human force could have minimized in the slightest degree. It was an unusual occurrence and may never happen again with equal severity during the lifetime of the present inhabitants of the state.

With all the destruction that the winds left in their path the actual loss in dollars and cents to the citrus fruit growers was not a comparison to what may sometime happen through the insidious visitation of silent Jack Frost. Possibly there are no absolutely "frostless" sections within the confines of the United States. There are certain districts which are claimed to be immune but there does not appear to be any good reason for believing that any portion of the country may not be visited by frost.

It needs but a few hours for frost to destroy the work of the year or at least to reduce the value of an orange crop to a very appreciable extent. Not only does the grower lose a good part of the value of the affected fruit, but where such oranges are shipped at cheap prices the value of his, or his neighbor's better fruit is hurt to a degree. First because a given quantity of oranges selling at a low price renders it difficult for the retailer to get the legitimate price for the immune fruit but because frosted stock disgusts the consumer to such an extent that for the time being at least, he is out of the market for any kind of oranges and thus consumption is lessened.

With such a condition confronting the grower the natural conclusion is that he wants to find some means to minimize the danger, at least to the extent of taking a fighting chance to save his fruit. To this time the only artificial means in sight are those of fighting the frost with fire and smoke. All growers who have adopted the latest scientific means of fighting frost report at least a partial success and there seems to be no good reason to believe that even with the present equipment at hand that all endeavors to thwart the enemy should not meet with complete success, always with the proviso that the thermometer outside the protected district does not stay below 25 degrees for too long a time and provided the grower be provided with sufficient and proper equipment and plenty of fuel.

To know when to fire and to be Johnny-on-the-spot at that time is of course very essential. In communities not in direct touch with the weather bureau it would seem absolutely essential that the farmer stay up all night to watch his thermometer when danger threatens or that he install an automatic frost alarm, now in common use in all sections of the country where fruit growing is done on a large scale. If the common house thermometer is to be depended upon it should be tested for accuracy and any government bureau office will do this work free of charge. Cheap thermometers are not wholly reliable and may vary from two to five degrees in their readings and this is not close enough for the important work for which they are used.

There are several efficient smudge pots now on the market and no doubt the selling agents are perfectly willing to give an orchard test at any time to satisfy any possible purchaser or group of interested growers. The main thing is to get an equipment that you are satisfied will do the work claimed for it and to get enough equipment so that you will not fall down when the time comes through a mistaken endeavor to save one the original cost price of the outfit.

Insurance of any kind is hardly wasted. The man who carried it was protected during the time he paid for it and that is all he paid for. The writer once heard a man refuse to take out a fire insurance policy because, as he said, he had been insured for ten years and never had had a fire and he called it money thrown away. He seemed to regret that he had never been able to bring a bill against the insurance company. Danger from frost is a nearer possibility than danger from fire and usually much more expensive when it does come.—Florida Fruit and Produce News.

ARIZONA ORANGES.

Arizona orange growers are much gratified at the prices their fruit commands, and quote about a $6 average received in Eastern markets during December and January, 1908 and 1909, as evidence of the market's consideration of them.

Regarding this year's shipments the Arizona Republican says:

"Seven carloads of oranges have been shipped to Eastern points by the Arizona Orange Association since the present season began. Two carloads will go out today, and two more each day until the end of the week. By that time the size of the crop can be guaged with some degree of accuracy. At present it can only be guessed at.

"The packing house is handling the oranges as fast as they come in. Up to this time it has never been taxed to its capacity. Two carloads a day can be handled with ease. This week may be its busiest period of the entire season.

"So far as quality goes, the oranges are just what are wanted in the Eastern markets. The only drawback to this year's crop is that the oranges are too large.

"Dealers prefer to handle oranges that run about 125 to the box. The average is about 150. But this season's oranges from the Salt River Valley groves are so uniformly large that some of them run only 64 to the box. They are just a little bit too small to be called pumpkins, but are in many cases fully as large as cantaloupes.

"The situation that confronts the growers of this valley is indeed unique. They stand in actual danger of losing a portion of the profits they expected, because their oranges are so large."

Speaking of a shipment of Arizona oranges a dispatch in a daily paper says:

"Monday the first carload of Arizona oranges was started by fast freight for New York, where the highest prices ever known for the local product are expected. It is believed that the best of the fruit will realize $10 a box. The fruit is sweet and well flavored and fairly well colored. Three carloads will go out this week. The crop in this valley is expected to be very light this year, owing to the cold weather of last winter, and it is improbable that more than eighty carloads of strictly first-class fruit will be dispatched."

THE CHERIMOYA.

Anona Cherimolia, "cirimoya," by some wrongly called "custard apple," which name belongs to the West Indian A. Reticulata, has never been a success in California. A small bushy, tree, with broad, aromatic leaves, and greenish flowers, not attractive, but exhaling a most delicious allspice fragrance, mostly during the night. It will begin to bear when about three years old, its large, variously shaped fruits, of a dull green color, attaining over one pound in weight and of the consistence of ice cream when ripe; taste hard to describe, but generally relished by everybody. It grows easily and fast, and ought to be in every garden for the merits of its foliage, flowers and fruits combined. To the present date only seedlings are grown, but now that more attention is being paid to this delicious fruit, improved varieties are sure to be noticed and propagated by grafting or budding.—Dr. F. Franceschi.

Laying Hens, Pullets, Cocks, Cockerels, Etc.

700 to 1000 on hand daily. Right now is the time to get the best birds at the lowest prices as we wish to close out a few hundred before the fall rains come.

Write us for prices, STATING EXACTLY what BREEDS you are interested in and how many you need, and we will make you the lowest possible price. We ship everywhere and mail free a 32-page catalog and price list to all who ask for it.

Our prices are changing and will have to be made in writing on anything you wish in grown chickens. We are hatching and shipping many kinds of BABY CHICKS every week at present. Write today and tell us your wants. Largest Baby Chick Dealers in the World; largest fancy poultry yards in Los Angeles.

Deciduous Tree-Shrub Fruits

LOW-HEADED TREES IN THE ORCHARD.

By R. S. Herrick, Colorado Agricultural College.

During these days when some advancement is being made in our orchards along more scientific lines, one often hears arguments against some of the things proposed and practiced by some of our best orchardists. One of these is against the low heading of fruit trees.

By a high-headed tree we mean one whose branches come out of the main trunk four or five feet above the ground, or, as the writer heard one man say, "high enough so that you can get a horse close to the tree in cultivating." By low-headed trees we mean trees headed near the ground depending somewhat upon the variety. Peaches in one of our best peach growing sections are headed practically at the ground, while apples are headed from twelve to eighteen inches above. It is, of course, possible to allow the fruit-bearing wood on what was at first a low-headed tree to be several feet from the original head, but with proper pruning from the start this trouble can be easily overcome.

An apple tree that is headed high is, in some respects for practical purposes, anything but high; for example, the chances are that such a tree will have the lower branches, at least, growing at almost right angles to the trunk, or in other words, in a horizontal position. When such a tree is bearing a heavy load of fruit, these limbs will bend down and are very likely to break unless props are used. The use of props in an orchard is at least a sign of very poor orchard management in the past, and should be avoided. It is possible to train the high-headed tree so that the branches will have more of an upward growth, but it is a recognized fact that work done several feet from the ground is never as satisfactory as when done from a short ladder, or while standing on the ground.

In a low-headed, well-trained and pruned tree we have all the essentials for a profitable one, other things being right. We have a tree that is easily managed in regard to pruning, spraying, thinning and packing. Good labor for doing these things is always at a premium, and it goes without saying that the amount of time it takes for such an orchard is less than for a high-headed one. In the second place, it is a well-known fact that low-headed trees are far less subject to sun scald than high-headed ones. And the third reason is that when orchard heaters are used the low-headed trees receive more benefit than the high ones. Especially is this true when a strong, cold wind is blowing. The writer has seen a notable example of this in a peach orchard where orchard heaters were used. During the coldest nights there was a heavy, cold wind, the consequence of which was that scarcely any fruit was borne above the four and one-half foot mark, and just a little above this point a thermometer was located which showed a temperature many degrees below the danger point. Below the four and one-half foot mark there were plenty of peaches; in fact, some of them had to be thinned.

HOME-MADE VINEGAR WITHOUT CIDER.

Take a gallon of cornmeal and boil in water until it is soft; put it into a ten-gallon barrel and fill with strong molasses and water. (I prefer sorghum or sugar house molasses.) Two gallons of molasses will be about the right quantity. Leave the bung out and tack a piece of cloth over the hole. In a short time it will be good vinegar. If it should be too weak, more molasses and water can be added or the washings of vessels that have contained honey or molasses may be poured into the barrel as they accumulate. Rainwater is best to use. The use of a piece of "mother" will hasten the making. As soon as the vinegar is made it should be racked off or strained and put into clean vessels or the same barrel may be washed out and used.

Vinegar From Apple-Parings.

A product as good as the best cider-vinegar may be made from the parings of apples and peaches as well as grape-pulp. Put these parings into a barrel or stone jar and cover with rain or cistern water. A galvanized or tin vessel is not suitable as the acid will eat off the coating. After it has been in this vessel for several days or until fermentation sets up, and before the parings begin to soften, strain off the liquid part into a barrel or even into a barrel containing some old vinegar or some made by the above process. This will make vinegar quicker than pure cider, and the addition of molasses and water will make it stronger. A little vinegar "mother" will always help in the making. If it should chance that one hasn't the apple-peelings, an apple flavor may be given to vinegar by boiling some dried apples, pouring water over them and allowing to stand a day or two; then strain off and add to the vinegar. By saving the parings and rinsing all vessels containing honey, molasses and sugar syrup with clean water and pouring into the vinegar-barrel, almost any housewife may have vinegar of the best quality.—Green's Fruit Grower.

FAKE NURSERYMEN.

California has been comparatively free from fake nurserymen and has a large number of most reputable and responsible men in the nursery business. The standing of these men is easily determined and safe dealing should be the rule with the buyers. But a subscriber sends us a clipping from which we take the following which shows that in Washington and Oregon a condition obtains which calls for a close watch on the part of orchardists:

"The company which I had experience with had its head office in Denver, Col., and had been doing business in Idaho, Washington, Oregon and Montana for a year or more. They gave references from a Denver bank and also from one of our own Spokane banks, but upon investigation the

Deep Well Pumping For Irrigation.

The past season has demonstrated more than ever the practicability and superiority of the Pomona Deep Well Pumps. It is fully proven that it is possible to lift large quantities of water from very deep wells with a surprisingly small amount of power. It has usually been considered that a plunger pump is only good for a 35-inch stream on a lift of say 200 feet, but the Pomona Manufacturing Company have demonstrated that it is no longer necessary to use a centrifugal pump, with its wasteful usage of power, to get a large quantity of water out of the ground, as this company is manufacturing extra large size cylinders including 12, 13, 14 and 16 inches in diameter, and capable of lifting from 50 to 100 miner's inches of water. Not only that, but they are prepared to go down after it to depths of 300 and 400 feet if necessary.

They have one plant at Claremont where the water stands 390 feet below the surface and the pump has a total lift of 450 feet, delivering 45 miner's inches of water with 60 H. P. on the motor, and doing it easily. There is another plant in Ontario lifting 60 miner's inches 300 feet with a 60 H. P. engine.

The parts below the surface have been so perfected that they are perfectly reliable and are giving as little trouble as it is possible for a machine to do. Other pump makers, noting the wonderful success of the Pomona Pumps, are trying to imitate them, promising something just as good, but they are only imitators and have not the knowledge or ability to make their claims good.

The Pomona Manufacturing Company has a large plant at Pomona, the only one in Southern California, devoted almost exclusively to manufacturing Plunger Pumps. They are a reliable establishment and are here to stay, to make good their guarantees and to supply your wants in the way of extras or assistance. Their machines and apparatus have been tried out and their value fully demonstrated.

Anyone needing pumping machinery should send to them for catalogs, or visit them in person.

SOY BEAN OIL MEAL.

The manufacturers of "Proteina" Soy Bean Oil Meal are meeting with splendid encouragement from the dairymen and poultrymen of the entire Pacific Coast. This new feed is made from the Soy Bean, grown extensively in China and Manchuria. The bean contains about 18 per cent of oil.

Most astonishing results have been reported from time to time by many experiment stations when testing the feeding value of the Soy Bean. The United States Agricultural Department in Farmer's Bulletins No. 372 and No. 58 makes the following statement: "Soy Beans are more valuable than cotton seed meal as a supplemental feed in the production of pork, mutton, beef, wool, milk and butter." "A bushel of Soy Beans is at least twice as valuable for feed as a bushel of corn."

Many of the leading poultry men claim that "Proteina" is a splendid poultry feed, being rich in protein and egg making constituents. "Proteina" Soy Bean Oil Meal is found to be as good a conditioner as linseed oil meal and produces a glossy coat of hair or feathers without the strong laxative effects of other oil meals.

The Soy Bean Oil Meal during the last two years has also come into general use in large quantities in such dairy countries as Denmark, England and Holland, where it is fast becoming the most popular feed stuff.

Spokane bank said that they knew nothing of the party. The contract read that they agreed to set out 70 apple trees per acre, care for, prune and replace all trees dying within a period of three years for $35 per acre, or 50 cents per tree.

"One of their agents came to me in March, 1910, and said that he understood that I wanted some trees. I told him that I was not financially able at that time to purchase them and he replied that he was the general agent for the company and that if I wanted trees he could give me a splendid contract on some pear trees, so I ordered 464 pear and 225 apple trees, the pear trees not to be paid for until they bore fruit enough to pay for themselves.

"They took my note for the amount at 6 per cent and started to make deliveries last spring. The president of the company came here to oversee the delivery and as the general agent had written me a contract on the back of my note I showed it to him and asked him for one of his regular contracts with the special agreement in it.

He refused to give it to me and I told him that unless he did so I would refuse to accept the trees. He then made me a proposition that I take up my note for $200 cash and they would give me a regular contract in which they would agree to set out the trees, prune and care for them for a period of three years. I accepted the proposition and along in August I took an invoice of my stock and found 325 pear trees and 88 apple trees dead. I notified the company by mail, but they did not answer and I wrote again and sent the letter by registered mail and it was received by the president of the company on the 6th of September, but notwithstanding they have entirely ignored me."

The trouble in this case is that the grower was "easy." He needed a little California ginger which would have impelled him to look up such a proposition before, not after.

DOMESTICATED ANIMALS AND PLANTS.

Some months ago the Cultivator had occasion to review "Principles of Breeding," by E. Davenport, professor of Thrematology in the University of Illinois. The same author has just published, through Ginn & Co., of Boston, a modification of the "Principles of Breeding," or a treatment in a more popular way of a subject which is but little understood.

The aim of this work is to stimulate a widespread interest in domesticated animals and plants—to account for their origin, describe their life in the wild, explain their appropriation by man, show our dependence upon their services, state clearly the methods and principles of their further development —and, incidentally, to explain heredity in such a simple way as to bring within the range of the young student and the general reader the main facts of transmission, applicable alike to plant and animal improvement, and to human relations as well.

The book is divided into two parts, either of which is complete in itself. Part I constitutes a brief course covering the essentials fundamental to the understanding of hereditary transmission and of the possibilities of plant and animal improvement. Part II has to do with the origin and a bit of the history of domesticated races and the manner in which they have been brought from their wild state to be the servants of man.

CUTTING BACK OLD PEACH TREES.

After the lapse of three or four years, unless peach trees have been carefully pruned every year, they are generally of a straggling appearance, without bearing wood only at the extreme ends. This is not desirable, and with proper management need not be. However, when trees are in this condition they can be made as good as new by a good pruning when they are dormant, say toward the approach of spring. Saw them back to near the lower ends of the branches, when new shoots will follow, resulting in trees full of vigorous young shoots. When the cutting back of all that appear to require it would result in the loss of a crop the season approaching, there may be a compromise in pruning. Instead of cutting back all the limbs, take the worst only, letting the rest go until the year following. The appearance of the tree would not be as good as it would were all the limbs cut back at the same time, still the getting of fruit is of more consequence than the appearance, oftentimes. To prevent trees getting "long-legged," as gardeners call it, is easy. In summer, when the growth of shoots is being made, go over the trees, nipping off the ends of those that seem growing out of line. A pinching back of the shoots that need it causes the side buds to break the tree thus making a symmetrical tree and one from which the fruit is easily gathered. It is shaped in this way easier and quicker than when growth is let form as it will, trusting to the knife to set matters right later; and this applies to all trees as well as to peaches.—Practical Farmer.

BORERS.

Answering a query as to eradication of borers, an Eastern exchange says:

There is no successful remedy or cure for trees once badly affected except to drill the borers out with a gimlet or slender wire. We have, however, been inquiring among foresters and tree men for some good preventive which might keep the pest from spreading and in time, as the grubs die off, work out their extermination. One man whose trees had been affected by borers gives the following treatment which he has followed for the past three years. To a solution made by dissolving one pound of hard soap in two gallons of water add one pint of crude carbolic acid. The solution should be heated to the boiling point when the carbolic acid is added. Take one pound of slacked lime, thin it with a gallon of water and add a little Paris green to it. Then mix these two solutions thoroughly and with a spray pump or scrub brush apply it to the trunks of your trees the last of May. Repeat the operation in a couple of weeks. If this wash is applied to the trunks of the trees at this season of the year it will prevent the laying of eggs on the trunks and consequently no borers will be hatched to drill their way into the trees.

Do not allow the fruit to stand in the sun, keep the fruit out of the rain after it is picked and do not pick fruit right after a heavy rain or during rainy weather. Don't pile the fruit in the fields. Use lug boxes for removing the fruit from the orchard to packing house.

WRITE FOR CATALOGUE AND PRICES

Trees: Book orders now for the following standards.

Peaches: Tuscan, Orange, Phillips, Levi, Foster, Triumph, St. John, Early Crawford, Elberta, Muir, Lovell, Fay-Elberta, and Salway.

Peaches have paid growers more profits in the last 25 years than any other fruit.

Apples: Alexander, Red Astrachan, Gravenstein, White Astrachan, Jonathan, Rome Beauty, Spitzenburg, Bellflower, Newton Pippin, Grimes Golden Pippin, Ortley, McIntosh Red, Winesap, Wagner, Winter Banana, Arkansas Black and many others.

Get in your orders now for Gravenstein, Jonathan, Spitzenburg, Yellow Newton Pippin, White and Red Astrachan, Alexander. They always sell out first.

Cherries: Black Tartarian, Bing, Black Oregon, Black Republican, Royal Ann, Lambert.

Cherries are great money makers. The above varieties always sell out early.

Also all standard varieties of

Plums, Prunes, Apricots, Almonds, Pears, Quinces, Persimmons, Figs, Oranges, Lemons, Etc.

Our trees are selected, thrifty, well-rooted and true to name.

The SILVA-BERGTHOLDT CO. NEWCASTLE CAL.
PLACER NURSERIES

BUY SEEDS BY NAME

If you were buying apple trees you would rather pay a reasonable price for named varieties, guaranteed true to name by a nurseryman than to buy unnamed trees just because you could get them cheap. Did you ever think of the fact that this same argument applies to seeds? Branded and guaranteed seeds are the safest and in the end the cheapest. There must be quality in every package, for the maker must make good goods or he can't stay in business. When you buy Lilly's Best Seeds, Northern Grown, you buy seeds that are true to name, pure and of high germination.

Don't take chances. Send for catalog. **CHAS. H. LILLY CO., SEATTLE,** for over a decade the leading Seedsmen of the Northwest. No matter where you buy, ask and insist on Lilly's Seeds, and if your dealer does not sell them write to us and we will supply you. Lilly's "Crop" Book is of great interest to farmers. Free

The Ornamental Garden

CUTTINGS.

A cutting is a part of a plant removed from the parent and placed under conditions favorable for growth. It may be either a leaf or stem of active, growing tissue, or it may be a stem or root of inactive or dormant tissue. In either case it should be of healthy material; it should contain prepared food (starch, proteids and oils), or tissue capable of preparing plant food, and it should contain one or more buds or growing points.

All cuttings require a moist, warm atmosphere and a porous soil, in some cases warmer than the air above it. Plants differ greatly in the amount of heat and moisture necessary to induce root formation from cuttings. Many hard-wood dormant cuttings will grow readily out of doors, but cuttings of most plants strike root better if the air can be kept cool and the soil warm, with plenty of moisture in both until the roots form. A shallow earthen vessel filled with sand, placed in the living room and kept moist will answer the purpose very nicely for starting cuttings of many of the common flowers and ornamental plants. The common manure hotbed will give good satisfaction in starting most plants both from seeds and cuttings. These are made by digging a pit eighteen to twenty-four inches deep in a well-protected and well-drained location. The pit is filled with fresh horse manure that has been thoroughly forked over and is starting to heat. While filling, the manure should be packed or tramped solidly. A frame or box without a bottom and with one side higher than the other is then set over the pit with the low side toward the south. From four to six inches of sand or sandy loam is placed over the manure, and after the heat has fallen to 90 degrees F. the seed or cutting may be placed in the soil. The frame is covered with a glazed window sash sloping toward the south.

In propagation from green cuttings, healthy, vigorous, young shoots are taken from one to three inches in length. The leaf surface is reduced by removing some of the leaves, entirely or in part. This is for the purpose of lessening the loss of moisture from the part before the roots have formed to absorb nourishment from the soil. The large end of the cutting or the end that grew nearest the body of the parent, should be placed in the soil from one to two inches in depth. The cut should be made at, or near, a node or joint, because roots usually form more freely at this point. As soon as rooted, the cuttings should be transferred to a rich soil from which plenty of plant food can be secured. Geraniums, carnations, chrysanthemums, roses and many other plants are propagated from the growing stems.

The begonia and many other plants having thick, fleshy leaves with large veins or nerves are frequently propagated by leaf cuttings. After cutting across the principal veins in several places, the whole leaf may be pegged or weighted down to the sand in the cutting bed and new plants will spring from the wounded points. The leaf may be split along the mid-rib and the edges placed in the soil. The may also be cut into triangular pieces with the point extendinng into the mid-rib and placed in the soil, point downward.

The currant, gooseberry, grape, lilac and many others readily propagate from hard-wood cuttings. These should be taken in late fall and early winter, tied into bundles of convenient size and stored over winter in a cool, moist cellar or buried in the soil below the frost line. They should be from six to ten inches in length. In the springtime they may be placed in the greenhouse, the hotbed or out of doors in a rich, loose soil. It is usually best to rub off all the buds except one or two at the top, otherwise more than one stem may be secured. This is especially true of shrubby plants, like the currant and gooseberry. The cuttings are placed upright or slanting in the soil and only one or two buds should be allowed to show above ground.

Certain plants are frequently propagated by root cuttings. These are taken in the fall after growth ceases, cut up into pieces from one to three inches long, and packed in boxes with alternate layers of moist sand. The boxes are stored in a cool, moist cellar until spring, when the roots are placed in the propagating bed or out of doors in furrows about one to two inches deep. Both roots and leaves arise from these small pieces. Roots the size of a lead pencil are considered best. The blackberry is aften propagated in this way.

While tubers are simply thickened roots or stems, tuber cuttings are so unlike ordinary stems or root cuttings that they deserve special mention. The most common tubers are the Irish and sweet potatoes. The Irish potato contains eyes or buds and they are cut so that each place will contain one or more of these growing points. Roots rarely spring from the tubers themselves, but from the base of the new shoots. These new shoots may be removed and transplanted, and new ones will arise from the tuber. Three or four crops of sprouts may be obtained from the same tuber. While this is rarely ever done with the Irish potato, it is the common method with the sweet potato. The tubers of the latter are placed in the hotbed either whole or cut once, the long way, and placed in the soil with the flat side down. Shoots arise from the skin of the tuber at almost any point. Cuttings of the stems of tuber-producing plants will often produce tubers instead of roots. These tubers must then be planted to secure a new plant.—Ohio Agricultural Bulletin.

There is nothing more charming than a well-designed house surrounded by a fine landscape, particularly when the two are harmoniously united by artistically treated grounds; and of the essential features of home grounds none is so important as a beautiful lawn.

The Hamilton Sugar Factory manufactured 150,000 sacks of sugar this season. Last year's output was 93,000.

Garden and Field Crops

STRAWBERRY, QUEEN OF AMERICAN FRUITS.

The strawberry, the queen of fruits, is a native of both America and Europe. The early colonists found it growing in abundance throughout those portions of this country early settled, and there are records of the discovery of berries in the meadows which were found one-half inch in circumference, and bushels of them that were from three to four inches. It would appear from this that the large sized berries have not been entirely the product of cultivation.

Roger Williams mentions that they were one of the fruits growing naturally and abundantly in those parts and a learned doctor of England was wont to say that God could, but never did, make a better berry. Sometimes they were so abundant in the early days that they could be picked by the bushel.

Cultivation began in Europe early in the seventeenth century, and the berry responded freely to the improved opportunities to develop, but it was not until later, when berries were introduced from Virginia and Chile, that they really flourished as they might do.

The strawberry is of the same family as the rose, but the fruit is not the fruit at all. It is like the fruit of the rose turned inside out, and pips or seeds are carried on the outside of the pulp instead of the inside, as in the case of the rose. The cultivation of the berry has increased the quantity of the pulp and the flavor has been improved, but the nature of the berry remains the same as it has been through all the ages of its existence.

The Chilean berry was taken first to California and from there distributed through the country. The same berry was taken to France, but it was not hardy enough to stand the climate of the British Isles. From this Chilean berry crossed with the native varieties has come the most famous of the present cultivated berries.

Some growers incline to the belief that the wild berry has imparted none of its characteristics to the cultivated sorts, but others say that the wild berry has made the cultivated berry hardy, and there are those who declare that the wild berry is responsible for the excellent flavor of the present cultivated sorts. Of course, questions of this sort are more for the discussion of horticulturists than for the layman. Perhaps the average person is more concerned with obtaining a sufficient supply than he is with their origin.

The quantity of strawberries produced increases. And the consumption outruns production. In a city like New York, for example, the berries are coming throughout every month of the year, with the possible exception of November and maybe October. But there are strawberries from the South for Christmas, and by this time it is possible to buy them in as large quantities as may desired at relatively reasonable prices.

During the summer it is not unusual for one hundred cars to be received and distributed in New York daily. As many as one hundred and twenty-five cars have been received in one day and distributed before night. This indicates in some degree the enormous demand for them.

They begin to come from the distant South early in the year, and the march is steadily northward, ending in New York State in August. They are shipped in small baskets holding one quart each, packed thirty-two in a crate, and arrive in excellent condition. The grower gets something like 3 cents to 4 cents for his berries at the field side. The consumer pays as high as 25 cents at times, though of course not when the season is at its height. The hothouse berries, which come first, sell at high prices. It is not unusual for the first arrivals to sell for $1 a quart, though, of course, that high range of values doesn't last very long.

Even though the cultivated berry is consumed in such enormous quantities, it never quite compensates for the delicious dew-kissed wild berry which is buried deep in the grass of the meadow. The flavor of that berry once enjoyed will never be forgotten, and will always be used as a standard for judging the berries which grow in the gardens. The little barefoot boy with his lips of red made redder still, kissed by strawberries on the hill, knows of secrets which the city dweller will never discover, and his standard of strawberries is so much higher than that of the city consumer that it will never be the same.—Grocers' Criterion.

POTATO STORAGE.

Each year the storage of potatoes is becoming a subject of greater importance. The object to be aimed at in storage is to keep the potatoes at as low a temperature as possible without freezing, and at the same time keep the surrounding air as dry as possible. Potatoes should be pretty ripe when harvested, as skin-lip potatoes turn black, do not keep well, and are unattractive when exposed for sale.

I was once talking with a friend who was going to leave the country. He said that in an old tunnel I would find some supplies, including 12 sacks of potatoes, which had been put there two years before, and which I might have. The condition of these potatoes was apparently the same as when they were dug; they were not shriveled, no shrinkage was apparent, the eyes were not swollen, and when cooked they were just as edible as when dug out of the ground. There had been an air shaft constructed at the end of the tunnel and through the tunnel was a good current of dry air. The temperature was about 40 degrees F. When the writer came to build a potato cellar he tried to get as near those conditions as possible.

The cellar is 50 by 200 feet. At each end there is a dead-air space of about 10 feet in the form of a vestibule between the outer and inner doors which affords protection from freezing. There is a driveway clear through and on either side the bins are located, skylights and ventilators being placed every 10 feet. The temperature of the cellar may be lowered by opening the doors and letting a current of air pass through.

One important point in the storage of potatoes is to reduce the temperature to as low a point as possible directly after the product is stored.—Bulletin 306 U. S. Dep. Ag.

Plant Bulbs Now!

Right now is the time to plant flowering bulbs. In the hot house they will flower for Christmas. In the window box or garden they will be ready to blossom in the early spring. Plant a few bulbs in your garden now and you will have a profusion of most beautifully colored and most fragrant of flowers, a typical California garden.

We carry the best of imported bulbs from Holland, France, Japan, China. They are grown especially for us and are strong, hardy, prolific flower bearers.

Morse Special Assortment

consisting of 130 of our best selected bulbs assorted as follows:

6 Named Hyacinths, assorted
15 Trumpet Daffodils
15 Long Stem Tulips, mixed
20 Spanish Iris, mixed colors
20 Crocus, mixed
12 Hyacinths, all colors
6 Double Daffodils, Von Scion
12 Jonquils, Campernele
12 Freesias
12 Snowdrops, Giants

130 Bulbs in all, for $2.10. (By mail 40c extra.)

Our beautifully illustrated bulb catalog, illustrating and describing all our bulbs and seeds for fall planting, sent free to any address.

Bees and Their Care

RHEUMATISM AND BEE-STINGS.

I have been instructed, amused and depressed as my mind has been played upon by the various references I have seen in professional, miscellaneous, news, and special journals upon bee-sting poison and rheumatism. I have experienced these different mental modalities as sense, nonsense, and ignorance are exposed by the various writers. I am not an expert in the ways of bees nor in the production of honey. I am only a country doctor who studies among other subjects of routine, "rheumatism." Any one who is looking for a cure for rheumatism is searching for what he will never find. One who is looking for a relief for his own rheumatism may find it.

The old-fashioned notion that there is a cure for a disease—i. e., that a disease, separate and apart from its peculiar manifestations in the person who has it, has a medicine that will operate curatively, is no longer held by any one who has a comprehension of the nature of disease and the action of remedies. Diseases manifest themselves differently in different people. In one, so-called rheumatism manifests itself in one way; in another person its manifestations are as different as if due to another cause. Some have the pain located in the back, others in the trunk, some in the small joints, others in the large ones. In some the pains are muscular; in others they appear to be in the tendons and sheaths of muscles. In some it hurts all the time; in others pain is periodical, or aggravated by particular conditions. Some have fever with rheumatism, and are sick abed. Some have heart-valves and heart muscle involved. Some can not move; others are so restless they can not keep still. Now, to relieve the particular manifestations of the rheumatic affection a remedy must be selected that corresponds to the individual's case. Every person has his own individual rheumatism. Be the aggravation in his heart, general muscular system, tendons, sheaths of muscles, joints, or where it may be, it is affecting him differently, and he is a different "rheumatic," just as he may be a child, a grown-up person, one with good habits, is afflicted with other taints, is rugged or weak, plethoric or anemic, exposed or well housed, confined to bed, or impelled to move about for relief, etc.

Physicians no longer prescribe medicines for diseases. They prescribe for the sufferer who has the disease and dispense the remedy as indicated by the signs and manifestations in his particular case.

The actual cause of rheumatism is not known; but it is known not to be uric acid. Uric acid may be the cause of gout, but not of rheumatism. The opinion generally prevails among scientific physicians that rheumatism is a germ disease, although the exciting microbe or microbes have not been satisfactorily identified. Some rheumatics are relieved by salicylic acid, some by aconite, some by one remedy some by another. There is no specific for it. Consequently, if bee-poison will relieve a form of expression that rheumatism may take, it is foolish to expect it to relieve all, any more than salicylate of soda will relieve all.

There is a type of rheumatism, or rheumatic-like ache and pain, that will be relieved by apium virum—the poison of bee-stings. The kind of joint and muscle aches and pains that will react to the bee-poison is that accompanied by local dropsical swellings about the parts affected. The skin around the sore spot is waxy and pale in appearance. The urine is usually scanty. The pulse is quick, hard, and small in severe cases.

Many cases of heart involvement with fluid in the "heart-sack" yield to it. The synovial (or joint) membranes are particularly frequent seats of the swelling that will respond to this treatment.

The cases of rheumatic-like states that will be relieved by the bee-poison are not the most common kind by any means. That is the reason that all who are afflicted with the ailment are not relieved by the treatment. Those cases that have been reported as cured or ameliorated have been the ones to which the poison is remedial; those that have not reacted needed some other kind of remedy, which may or may not have been one of a dozen.

The virus of honey-bees is a commodity in the drug market, and it is to be had from pharmacists for dispensing. It has its indications in the therapeutic field, and is in the armamentarium of hundreds of physicians. Those who know how to use it, and who understand its clinical indications, rely upon it with as much confidence as is to be reposed in any drug. I believe that there are dealers in and producers of bee products who can tell something about "orders" from pharmacists for raw material from which the remedy is produced.—Gleanings.

One of the first difficulties facing the beginner will be the diversity of system and management amongst the different beekeepers. He will find himself compelled to follow some distinctive line or system of beekeeping, and having decided this point, he will concentrate his thought, his reading and experimentation toward the development of his own selected system. Few books, and but a few writers can be wholly followed, and many a writer from whom we expect to learn nothing may often give us very helpful truths, and truth, however useful, can not be of much benefit to the reader until fully digested and made his own. The value of our reading is measured by the correctness of our judgment appropriating or rejecting what we read and the measure of our success in anything is dependent upon an unerring judgment and prompt execution.—Coleman's Rural.

The chief excellence of the modern hive is in the movable frames which are fitted with a groover, so that when the hive is opened the frames containing the combs can easily be removed, the combs examined, changed in any way the beekeeper pleases, and returned quickly.

Bee-keeping, if carried on intelligently, is as certain a business as any.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

MODERN DAIRYING.

By Mrs. M. E. Sherman.

The prices of milk and its products naturally are rising with other food stuffs. When one class of food prices goes up the thrifty housewife buys some other article to supply its place. This makes that article a paying proposition and at once its price is put up too. Cows are sharing the general rise in values of beef cattle. The dairymen are receiving ten and twenty dollars each for heifer calves a few weeks old if the dams are reasonably good cows. These heifers that used to go to the butcher are now being raised for cows to sell to the dairymen. The high prices of common stock have brought the dairymen to the point where they see that the registered pure-bred cows will be more profitable to handle.

Prices.

A sale of mixed cows and heifers in San Diego county brought an average price of sixty dollars a head. The owner now goes East to buy registered stock and enter the ranks of breeders. At another auction sale in the San Joaquin Valley the animals averaged seventy-five dollars a head. This is even more remarkable as cattle are usually cheaper in the Great Valley than in Southern California. The pure-bred animals on the farm usually appeal to the owner and receive more care than common cows. They are intensely interesting and no one knows how much pleasure there is in breeding livestock except those that have experienced it. Every calf in the herd represents a new individual and its points are studied with the greatest interest. The cropping out of strains of ancestry is marked in animals. They carry the form and style often of their grandparents.

Scientific Breeding.

The day has passed when the farmer is satisfied to go at things in a haphazard way. He is studying and working all the time to make things better on the farm. The pure-bred cow not only appeals to his mind but she appeals to his pocket book. She pays in dollars and cents every day. She milks more than the average cow; she gives a heifer that is as good as she is to continue the good work of the herd. Her son also will transmit her good qualities to all his offspring. The study of inheritance and the transmission of acquired traits is one of the most profound of all and one of the most absorbing. Animals like plants throw sports of greater excellence and it is by studying the performance of the entire herd that the extra producers are found and used to build up the herd. Their accidental or perhaps it would be better to say the actual balance of all that is good that holds them to superior performance is transmitted. Balance of physical with the mental qualities holds good in animals as well as in the human family when high performance is to be secured.

Shipping.

The shipping in of fully matured animals to California from the East is not always an immediate success. The disappointments often have led men to hastily condemn the breeders. The animals must have time to become acclimated before they do their best. The first noticeable change is the fact that the first year there is a lack of breeding powers. In the horse and other males the first year's offspring are often very few in number. The next year the power of reproduction returns. It is not well to condemn an animal before a complete change of seasons has gone around. The male creatures seem to suffer from the contact with mankind in the closeness of the cars and in the nervous tension of loading and unloading. Their lives have been quiet ones and the excitement of the train makes them wildly nervous. Then when they reach California they meet different conditions of food and climate, all of which must be overcome.

Unloading.

The humane law requires cattle to be unloaded every forty-eight hours. This means as soon as they grow accustomed to their quarters in a stock car, the law comes in to thrust them out into a miry unsanitary yard. They are hustled out often to stand in the rain or in the snow after coming from a warm car. The law is a good one in that it overcame the brutal shipments of beef cattle. These animals were packed into the cars as closely as possible for beef was cheaper than car space. Some laid down and never had a chance to regain their feet before their lives were trambled out of them. Without water or feed they remained often for several days. The dairyman bringing fine stock out to the Coast has to conform with the law even if the cattle only half fill the car and if they have abundant room to move around. The attendant traveling with them sees that they have water and feed at all times. It is a good law for unattended cattle but it is somewhat vexatious to the handlers of fine stock.

Buying Calves.

This necessity of the older stock going through a period of acclimatizing has resulted in a large trade in shipping calves by express. It is really the best way where only a few head are needed. The fancy bred young sires come through in good order at four or five months old. These little ones cost from seventy-five dollars up to five or six hundred according to breeding. The expressage is about seventy-five dollars a head from middle western points, one hundred from middle states and a little higher from the seaboard states. Many of the eastern breeders will guarantee safe arrival. All that I have ever sent for have reached here in good order and been satisfactory. Spring and fall months are the best time to ship as the animals escape taking cold on the trip.—M. E. Sherman.

EDUCATIONAL BUTTER SCORING CONTEST.

By Herbert A. Hopper.

The inspection of the sixth entry to the current year's contest, scored November 21, disclosed the presence of a more uniformly high scoring lot of butter than has previously been sent to any of the California scorings. This can be seen from the fact that the lowest score was 91, and the highest 95; and the entries submitted represented, as usual, butter manufacturing conditions over a large part of the state. The marked improvement shown in the butter submitted at the last two entries, in spite of adverse seasonal influences, is a matter of great satisfaction, and emphasizes as nothing else does the part the "contest" has played in helping several butter makers to make the most of their efforts.

Score of Sixth Entry.

California Poly. School Creamery, San Luis Obispo	95
Ceres Creamery, Ceres	94½
Univ. Farm Creamery, Davis	94¼
Santa Ysabel Creamery, Paso Robles	94
Castroville Creamery, Castroville	94
Salinas Creamery, Salinas	93½
Pioneery Creamery, Ferndale	93¼
Standish Creamery, Standish	93
Dairyman's Co-op. Creamery, Tulare	92¼
Bodega Creamery, Bodega	92¼
Suisun Creamery, Suisun	92
Visalia Co-op. Creamery, Visalia	91

Summary of Contest, 1910.

Highest average score, 93.95, University Farm Creamery, Davis, Cal. (not competing). The prize cups were won by:

1.	Simon Koppes, Ceres	93.41
2.	Ira King, Ferndale	92.95
3.	A. Jensen, Castroville	92.87

The special prize cup for improvement in methods and quality was won by J. H. A. Jorgensen, Salinas, 92.80. The total value of cups presented was $165.

Certificates of Merit.

E. H. Hageman (Univ. Farm)	93.95
Simon Koppes	93.41
N. J. Beck	93.30
Ira King	92.95
A. Jensen	92.87
J. H. A. Jorgensen	92.80
M. Resendes	92.79
F. T. Aitkin (Calif. Poly. School)	92.75
L. Hansen	92.45
V. Baciarini	92.08

The desire is to continue the contest, beginning early in 1911. At that time announcement of the plan will doubtless be made through the dairy press, and all suggestions regarding the same should be sent in early. In the meantime, buttermakers should prepare to support this enterprise to their utmost ability, as it is conducted entirely for them. The support which they give determines the success or failure of a lot of hard work.

CERTIFICATION OF RECOGNIZED BREEDS.

In order to enforce more thoroughly the provisions of the tariff law, instructing the Secretary of Agriculture to "determine and certify to the Secretary of the Treasury what are recognized breeds and pure-bred animals," as a basis on which customs officers may determine what animals may be passed through the customs free of duty for breeding purposes, the Secretary of Agriculture has revised the regulations on the subject.

In order to be entered free of duty all animals imported into the United States by citizens of the United States for breeding purposes on and after January 1, 1911, must be accompanied by certificates of the Bureau of Animal Industry that the animals are purebred of a recognized breed and duly registered in the foreign book of record established for that breed.

The new regulations will be published within a few days, and this statement is being distributed to give importers of breeding animals and others concerned ample notice of the matter. These regulations do not modify or change in any respect the regulations now existing relative to quarantine restrictions on account of contagious diseases. Persons intending to import animals for breeding purposes after January 1, from any foreign country where quarantine regulations of this department permit such importation, should apply to the Bureau of Animal Industry for application blanks for official certificates. The use of these blanks is necessary to enable the department to have full information concerning each importation.

The new regulations supersede B. A. I. Order 136 and its amendments, and have been drawn with the greatest care. The breeds certified are the some as under B. A. I. Order 136, with a few exceptions. Animals registered in the Canadian National Records will be certified for several breeds, where the provisions of those records are in harmony with the rules of the American books and the policy of this department. The list of certified British breeds remains practically intact. On the continent of Europe Percheron, French Draft, and Belgian Draft horses, Friesian, Netherland, and North Holland cattle, and Swiss and Belgian dogs are certified.

All American books of record are omitted on the ground that the provisions of the law under which these books have been certified in the past do not give the department authority to certify studbooks and similar publications in the United States.

Under the new regulations each foreign pedigree certificate will be carefully examined in the Bureau of Animal Industry and the animal itself will be inspected to determine whether it is the identical animal described in the pedigree certificate.

SOMETHING ABOUT MILK FEVER.

Although milk fever does not cause the death of nearly so many cows as before the use of the oxygen treatment, there are stil many good cows lost from this disease. Few farmers, comparatively speaking, own a milk-fever outfit. Fewer still have gumption to improvise one; still others do not watch their cows so closely at freshening time that the disease has not made great progress before it is discovered, and by the time a veterinarian can be summoned the cow is dead. The farmer with the herd of poor milkers is exempt from the disease. It attacks always the cow that gives a good quantity of rich milk.

Milk fever begins to show itself usually in about twelve hours after the calf comes, and the first symptoms are simply a refusal to eat and a general uneasiness. Usually the cow keeps up a gentle lowing, easily mistaken for the sound many cows make to a new-born calf. In a few hours the cow loses the use of her limbs, gets down with head around on her side, and becomes unconscious; death en-

sues in a few hours more. If taken at the start, little treatment is necessary to arrest the trouble. Fill the udder with air—I have heard of its being done by blowing with the mouth through a milking tube—then tie the teat with a piece of soft tape or cloth to keep the air in. This will usually arrest the disease; it is not too late after the cow is down and seemingly unconscious.

The best course is to summon a veterinarian as soon as the cow is discovered, but if she is bad get air into the udder by some means if possible before he comes. This will arrest the disease omewhat, and he will have a much better chance to raise the cow. He will doubtless combine the oxygen treatment with a course of medicine, and if he is good at his business, you will lose little of her milk, although she will doubtless shrink in milk somewhat.

I know two cases this past summer to come on after ten days of milking. The cows were extra good ones, were in good pasture and fed heavily on mill feed. The veterinarian said he had never had such a case after so long a period of milking, but the symptoms were the same—the cows down and seemingly nearly gone—so he gave them the milk-fever treatment and both recovered. Heavy feeding was the cause, in his opinion.

The best way to treat milk fever is to prevent it. While a cow should be well fed previous to freshening, she should not be fed on too concentrated food. Good hay, bran, a little oil meal, some potatoes or other roots to keep her bowels free, and exercise every day, make the proper regimen. At freshening, do not milk all the milk out of the udder for the first few milkings. These precautions will bring them in all right. Many people think a cow that has had this trouble once is very likely to have it again. I nearly lost a good cow with this disease. I kept her several years, feeding as above described for a month before freshening, and had no further trouble with her.

Any extra good cow is predisposed to parturient apoplexy or milk fever by virtue of the excess of butter-fat that she produces, and should be looked after both before and for some 12 to 24 hours after freshening. Oats are a good feed for freshening cows, and many farmers feed all a cow will eat, believing them a preventive of the ailments peculiar to freshening.—Country Gentleman.

A number of raisin and fruit growers near Fresno have formed a drainage district covering 55,000 acres. It is hoped the work can be done for about $4 per acre.

SWINE FEEDING IDEAS.

Ever since we saw the remarkable experiment carried on at the Wisconsin Experiment Station, showing the effect on three pens of pigs of (1) ordinary feeding; (2) ordinary feeding with the addition of a small amount of phosphate causing that pen of pigs to show unusual vigor and strength; (3) taking out all natural phosphate from the food of the third group of pigs, showing very disastrous effects in their growth, we have felt the conviction that the mineral elements of food had a great deal to do with bodily growth.

The Missouri Experiment Station has been at work on this problem and has brought out some valuable ideas on pig feeding. The work of the station has solved a few questions clearly. (1) Why does a corn diet produce a deficient growth of bone? Answer: Because corn contains too little ash and phosphate.

That was what the Wisconsin experiment plainly showed. But all the valuable experimental work of the stations will be useless if their conclusions do not get out into the conviction of the farmers. It is a slow process. The knowledge must be put out through printed knowledge; but few farmers as yet read these things understandingly, although their number is increasing through the young farmers who attend the short course.

The spread of this valuable knowledge must come through example, here and there a farmer who reads and puts into practice what he reads thus demonstrating its truth. The Missouri experiment had to do with several kinds of rations such as corn fed by itself, corn fed in combination with the following feeds: tankage, soy beans, germ oil meal, wheat middlings, linseed oil meal.

Each combined ration had the same nutritive ratio, but the effect on the hogs was widely different and here we come to the kernel of the valuable truth we can all learn; viz., that we must feed a ration that will stimulate the growth of bone if we wish our hogs to do well. This ration was found to be a mixture of corn and tankage, or corn and oil meal, or corn and soy beans. Here we have plenty of protein and phosphate.

Some may ask why is the growth of bone so closely allied with the general promotion of growth and weight? We cannot say, but we will state the following physiological fact. The red corpuscles in the blood are constantly formed from the bones that have red marrow like the ribs and spinal column. The vitality of the blood is therefore dependent on the proper nourishment of a certain portion of the bony structure. To this end the food must contain sufficient phosphate, protein, and calcium.

Farmers must study the physiology of feeding as well as that of breeding. We know as yet but little of these laws but that little seems to be very imporant if we would let nature help us.—Hoard's Dairyman.

KEEP QUIET.

A man who had purchased a fine-looking mare discovered, after driving the animal for a week, that she was blind. Shortly afterward he succeeded in disposing of her, as the defect did not lessen her speed or detract from her general appearance. The next day the owner of the mare appeared. "I say, you know that mare you sold me?" he began. "She's stone blind." "I know it," replied her last owner, with an easy air. "You didn't say anything to me about it," said the purchaser, his face flushed with anger. "Well, you see," replied the other, "the man who sold her to me didn't tell me about it, and I thought, perhaps, he didnt' want it known."—Country Gentleman.

Fortify your wire fence by placing boards around the bottom. The tighter these fit to the ground the better.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.

KENDALL'S SPAVIN CURE

The Remedy You Can Depend Upon

No other preparation has done as much for the horse and horsemen. Kendall's has saved millions of dollars in horse values for thousands of owners during the past 40 years. It is the quick, sure, safe, *dependable* remedy for

Spavin, Ringbone, Curb, Splint, Swellings, Cuts, Sprains, Bruises, all Lameness

$1 a Bottle—May Save Hundreds

CURES SPAVINS, CURBS, SPRAINS, MAKES CHEAP HORSES VALUABLE

Galien, Mich., Jan. 6, 1909.
Dr. B. J. Kendall Co.

Dear Sirs: I hesitate no longer in buying horses with Spavins or Curbs, in fact with blemishes of any kind, for I know what your medicine will do. I always make a handsome profit buying such horses cheaply, cure them up with your medicine, and sell them for a grand price. *Your medicine can't be beaten.*

Respectfully yours, JOS. HAAS, (R. R. No. 2)

WONDERFUL FOR MAN AND BEAST

1317A Kentucky Ave., St. Louis, Mo., Apr. 23, 1909.
Dr. B. J. Kendall Co., Enosburg Falls, Vt.

Dear Sirs: In regard to your Spavin Cure, I must say that *it is one of the best medicines that was ever put on the market* for sale. *I have been using it for the last three years in my stable*, and find it one of the best I ever tried for every kind of lameness or sore. *It is a wonderful remedy for man or beast.* I advertise your remedy every time I have a chance, because I know what it will do.

Yours truly, HUGO KING.

ALSO FAMOUS AS A FAMILY REMEDY

Accidents will happen and the greatest "First aid to the injured" is the old standby, Kendall's Liniment. *Sold by druggists everywhere* at $1 a bottle, 6 for $5. Prepare today for the emergency of tomorrow. Stop at the druggist's and be sure you get *Kendall's*. Ask for a copy of "A Treatise on the Horse and His Diseases," or write direct to

Demonstration Train

The special agricultural and horticultural demonstration train operated under the auspices of the Southern Pacific Company and the University of California started on its tour of the Sacramento Valley last Monday morning. The first stop was made at Lincoln. Other points on the route are Marysville, Oroville, Gridley, Biggs, Chico, Red Bluff, Anderson, Montague, Corning, Orland, Willows, Woodland, and many other cities of the valley.

The equipment of the train includes six cars containing a larger and more comprehensive line of exhibits to be used in illustrating and demonstrating points brought forth in the discussions, answering practically any question which the intelligent farmer or fruit grower may propound.

This is the third year this train has made trips in the different parts of the state. This present trip into the Sacramento Valley is the first of the third series. There will be five other trips, the last of which is from Los Angeles to San Francisco along the Coast Line. The others touch points in the lower San Joaquin Valley, upper San Joaquin Valley, Imperial Valley, Orange county and up the coast. Every line covered in an agricultural discussion from field crops, soils, fertilizers, animal industries, dairy industry, viticulture, irrigation, and on to entomology and poultry, is represented by exhibits. Exhibits in the poultry division will present various appliances and methods of poultry practice, and models of houses and yards will be shown. Home economics has a large exhibit in one of the cars, in charge of a most competent instructor.

The force from the State University accompanying the train consists of President Wheeler, Prof. Clarke in charge of the demonstration work, Profs. Shaw, Woodworth, Hermes, Burd, Lipman, Hopper, Cleghorn, Roberts, Wilkins, Yeaw and Hunt; Mrs. Sherman, Messrs. Packard, Flossfeder, Bryant and Thompson, Dr. Almeida and Miss Van Wormer.

Fake Eucalyptus Business

The Cultivator has never admitted to its columns the advertising of fake eucalyptus concerns which have during the last two or three years been working the gullible in this state. We have noted with regret that some so-called farm papers have not only admitted advertisements, but have joined in the effort to boost the business by setting forth its great profits. The planting of a eucalyptus tree is a worthy ambition and promises a blessing to the planter or his successors, and we hope to see many thousand acres planted to this wonderful tree, but the promises of immense wealth in return for a small investment have induced many who could ill afford it to put money into such schemes—to their certain disappointment and loss. The claims made by many of the promoters are so beyond all reason that the thinking investor has not been caught, but many others, more credulous, have believed and invested. Some of the plantings were made where they frosted down the first year, and some on land so poor that it can never produce a paying crop, much less pay the expenses which the promoters have incurred for handsomely fitted offices.

We note in the Country Gentleman of September 22nd an article by our friend, Mr. John T. Bramhall, in the northern part of the state. He touches particularly upon actual production as shown by measurements made by the forest service, and emphasizes the fact that the claims of great production cannot be proved by any planting yet made in California. From Mr. Bramhall's article we quote:

"The representative of two companies engaged in this business says that he has not seen a single misstatement in any of the literature of the business. His extremely limited vision makes him a valuable witness for the get-rich-quick companies. Passing by the statements regarding yield, how is it with the story so often quoted of the magnificent scheme to plant the line of the Los Angeles aqueduct to eucalyptus and reap a hundred-million-dollar harvest every ten years? That is no misstatement, I suppose? It seems to figure out all right, to be sure. Why doesn't the state of California buy a 500,000-acre ranch and multiply the Los Angeles scheme by ten? It being estimated that there are 50,000 acres in the canal strip, ten times that would be 500,000 acres, and ten times a hundred millions is a billion! Anything the matter with that? Nothing whatever, except that it is based on a lie. I call your attention to the following, from the Bureau of the Los Angeles Aqueduct, addressed to me a short time ago:

"'In reply to yours of June 4th, I will say that the paragraph which you quote concerning the planting of eucalyptus trees by the aqueduct bureau must have been taken from the prospectus of the company which was trying to sell stock in Los Angeles several months ago. The question of planting eucalyptus trees on the ranch property owned by the city in the Owens Valley was discussed in a very cursory manner, but it was never seriously considered, and the statement quoted by you is without any foundation whatever.' This is signed by Wm. Mulholland, Chief Engineer."

A Great Industry

According to figures compiled by Mr. F. H. Snow of Petaluma, that district produces about seven million dozen of eggs per year. This added to the sales of poultry realizes more than two and a half million dollars. This is the best example of poultry industry on a large scale in the world, and while Petaluma has some conditions favorable to poultry culture which may not be reproduced in all sections of the state, yet there is no question but that the industry may receive far greater attention in other districts to the state's advantage.

San Francisco is importing weekly an average of two cars of eggs. By importing, we mean bringing to this state from east of the Rockies. Los Angeles demands practically as much more, and but few sections of the state produce enough for home consumption, yet with this opportunity to meet the demand we would not encourage any to enter the industry in a large way without fullest understanding of its requirements. It is strange that people who would not think for a moment of entering into business or professional life without proper training, think they may leave these callings and go into the poultry business on a large scale with no knowledge of its details. It cannot be said that the industry demands the highest intelligence, but it does demand thorough knowledge, and unless these conditions are met, failure results. This accounts for the vast number of failures which this state has witnessed, for as we have expressed it before, there are more people going into the poultry business and more going out of it than any other. The people of Petaluma have reduced poultry farming to an exact science, and it has brought in much ready money to the community and even developed a great business. Some farms there are operated on an immense scale and the poultry is counted by the thousands instead of dozens.

Sweets as Valencias

It is reported that some shippers have labeled Mediterranean Sweet oranges as Valencias. The matter seems to be in the Eastern papers, and in one we note it has been reported to Secretary Wilson, who suggests that such action is in violation of the pure food and drugs act. It seems that it should not be necessary to invoke the operation of that act in regulating California orange and lemon shipments, but if we have dishonest shippers we will be glad if Mr. Secretary will call them hard. Secretary Wilson says in reply to a letter:

"We have your inquiry regarding the labeling of Mediterranean oranges as Valencia oranges. This, in my opinion, is clearly a violation of the food and drugs acts and if you can give us any definite information as to the parties so labeling, we will be glad to receive same and will take such steps as we are able to prevent this misbranding."

Some time ago the Cultivator had occasion to refer to the organization of a company promoted to handle a fertilizer which, according to experts of the Fertilizer Control at Berkeley, was not of sufficient value to pay for distribution on the land. The steps taken in the organization have not been such that criminal action could be taken, but we had supposed that the fake nature of the concern was so apparent that the wayfaring man might readily discern the danger signals. But only recently we heard that efforts are still being made to finance this proposition. Our informant tells us that he knows of cases where trusting men had put up good money and in one case its return had been compelled because the transaction was so close to criminal that the promoters became frightened. Farmers should look with caution on these offers to be let in on the "ground floor" with these promoters. The bait held out is that members of the "company" will have inside figures when it comes to the purchasing of the stuff which is supposed to fertilize the ground.

In the communication from Sonoma county which appeared in our issue of November 24 the Cultivator representative was made to say that ears of corn 18, 20 and 22 inches around were the rule. This is one of the mistakes of the typesetting machine which was allowed to pass without correction. It is easier to lay it to the machine for then no personal responsibility is involved. However, we regret the mistake very much. The sentence should have read, "Ears of corn 18, 20 and 22 rowed were the rule." California is some on corn as well as everything else she attempts, but 22 inches around is a little big.

An exchange says that the best way to preserve a manure pile is not to have any. Manure produces the greatest benefits when placed upon the ground immediately. One of the best implements on the farm is the manure spreader.

Agricultural News Notes of the Pacific Coast

Northern California

Oroville is shipping an average of about six cars of oranges daily.

Machinery has been ordered for a new ice and fruit cooling plant at Oroville, Butte county.

San Joaquin county ranchers are severely criticising the county engineer and urging his removal.

Decoto public school claims the honor of being the first agricultural school in Alameda county.

The People's Water Company will plant 6,000 acres of eucalyptus trees near Hayward, Alameda county.

Gridley is putting in shape a drainage system which will dispose of much surplus water in time of storm.

The Ehmann Olive Co. at Oroville has greatly enlarged its capacity. This company makes a specialty of ripe olive pack.

The long continued dry season is proving a serious matter for live stock growers and much anxiety is expressed.

Hayward, Alameda county, will begin a course in agriculture in its high school at the beginning of the next school term.

The Oroville Register reports the the passing through that city of carload after carload of live poultry coming from the East to the San Francisco markets.

The federal grand jury recently turned in an indictment against William Longfellow of Oak Bar, Siskiyou county, for wilfully setting fire in the Klamath National Forest.

Granting the request of hop growers near Wheatland, Secretary Wilson will send an expert of the Department of Agriculture to the hop-growing districts of Germany, Austria and England.

The Southern Pacific demonstration train service for this year began last Monday. The demonstration work is in charge of Prof. W. T. Clarke and a corps of instructors from the State University.

The Sacramento Valley Development Association is discussing highways across the Yolo Basin and taking steps to suggest the expenditure of the money from the sale of the $18,000,000 bond issue.

The standardization meeting at Newcastle on the 22nd brought out a big attendance of Placer county fruit growers, who enthusiastically endorsed the season's work and adopted standards for next year's shipments.

The Sutter Almond Growers' Association is running an almond cracker, the kernels having been contracted for by San Francisco firms. The deal was made through the Almond Exchange. These nuts are from the class known as "stick tights."

There is contention between County Horticultural Commissioner Bloomer and Prof. Elmore Chase of Sacramento county as to the manner of treating pear blight and noxious weeds. Prof. Chase maintains that pear blight has not been properly treated under direction of the commission.

Central California

Tulare county oranges are reported sweeter than ever at this time of the year.

Tulare County Citrus Fair at Visalia is attracting great crowds this week.

Persimmon growers at Grangeville, Kings county, found good profit this year in their fruit.

The Empire tract near Hanford has been producing large quantities of alfalfa this year.

Turlock peach growers, who co-operated in the marketing of their fruit, netted $40 per ton.

San Juan, San Benito county, has delivered 218 cars of beets to the Spreckels factory this season.

The convention of delegates to the District Fair Association was held in Stockton Wednesday, December 7th.

The Porterville Creamery is showing just pride in its record of butter scorings in Los Angeles, where it has topped the market.

Improved machinery is being used on the grain farms of Kings county, one of the later additions being a double disk grain drill.

Pajaro Valley has not yet reached the 4000-car mark though it has passed 3500, of which 3160 were shipped from Watsonville.

The Spreckels Sugar Factory handled beets from 20,000 acres, or an aggregate of 215,000 tons with an average of 18 per cent sugar.

Experts of the Department of Agriculture are inspecting various sites for grape experiment station near Watsonville, Santa Cruz county.

Raisin growers at Oleander, Fresno county, have started a movement for the storing of raisins until more satisfactory offerings are made by the packers.

A meeting was recently held in Stockton to take up the matter of a county fair. The Stockton race track has long been known as one of the best in the West.

The Old Mission grounds at San Juan Bautista, San Benito county, are furnishing to the California Development Board for exhibition purposes some fine pears from trees planted by the Spanish padres in 1797.

The California Raisin Vending Company is taking active measures to increase the sale of raisins and is building 1000 nickel-in-the-slot machines for the purpose of street vending. It is hoped to increase this number to 100,000.

Having seen notices in Eastern papers that Thanksgiving mincemeat was high this year on account of the scarcity of raisins, raisin people are inquiring as to the why of the scarcity when they are unable to sell at a living price.

Porterville, Tulare county, is very much elated over the fact that her apples were given prizes at the Chicago Fair, one apple being pronounced by the judges an absolutely perfect specimen and awarded a 100 per cent. mark. It was produced by George Dillon, in the hills above Porterville.

Southern California

Redlands' first Navels were shipped this year on November 27th.

Calexico, Imperial county, has an ambition to have a beet sugar factory.

Orange county's production of beet sugar this year has been 28,000,000 pounds.

Big crowds are attending the Imperial County Fair at El Centro this week.

The Hemet Driving Club recently gave a banquet in honor of its newly elected president.

The Orange County Celery Growers' Association will ship about 2000 cars early in the season.

Winchester, Riverside county, finds a more successful late alfalfa crop this year than heretofore.

The Salton Sea has decreased in depth from 72.3 feet in 1907 to 67.4 feet at its greatest depth.

A rabbit drive between Elsinore and Corona last week resulted in 200 bunnies giving up their lives.

The olive oil mill at Bloomington, San Bernardino county, began crushing about the first of the month.

San Diego is already receiving assurances from foreign countries of participation in the Panama-California Exposition.

Redlands Orange Growers' Association refitted its packing house and now has an entirely new system of packing machinery.

For the first time in its history Riverside county figures as a cotton producer. Its production this year was 125,000 pounds, produced in the Coachella Valley.

Some citrus orchards at Corona, Riverside county, have been found infested with red scale and an effort is being made to eradicate it.

Whittier, Los Angeles county, claims the production of three-fourths of a million dollars' worth of walnuts this year. The Whittier Association is the largest of its kind in the world.

El Centro cantaloupe growers are signing up contracts for next year's melon output. Owing to the amount of land given over to cotton it is claimed the melon acreage will be greatly reduced.

The farmers' institute at Thermal last week, with which was connected an exceptionally fine exhibit of products of the Coachella Valley, was one of the most successful events of its kind ever held in Southern California.

Moreno Valley water company now suplying water for 500 acres of orange land reports a most successful irrigation season. More wells are contemplated which will increase the flow by 200 inches.

The Antelope Valley Gazette reports a fine lot of pistachio nuts produced in that valley this year. These are the first nuts produced in Los Angeles county and are pronounced exceptionally high grade.

Orange county celery growers are anticipating the biggest season ever, the present month being the high tide in shipments. The price now made at Wheatlands is 20 cents per dozen f. o. b. Quality is the best.

The Coast

Eastern Washington was granted a soaking rain during the last of November.

Wheat producers at Pullman are selling wheat rapidly under the increased price.

Filbert growing is becoming something of an agricultural possibility in western Oregon.

Cost of turkeys at Yuma, Arizona, 30 cents live weight, was the lowest for years.

Inspectors have closed several dairies supplying milk to the city of Portland, Oregon.

A meeting has been called at Goldendale, Washington, to discuss the question of good roads.

One fruit buyer has contracted for the 1911 output of Douglas County Fruit Growers' Union.

Walla Walla, Washington, was given a precipitation of over one inch of rain last week.

Apple growers at Spokane are holding their Winter Pearmains of the better grade for the spring prices.

The first full trainload of apples to leave the Payette Valley in Idaho went forward on November 17th.

One shipper has purchased and shipped from Northern Idaho 555 cars of live stock since January 1st.

The Tieton storage project, costing a half million dollars, has just been completed at North Yakima, Washington.

An irrigation company has just completed a dam by which 4,000 acres near Washtucna, Washington, will be irrigated.

Apple growers at Elgin, Oregon, are shipping a car of fancy apples to points in the Middle West for exhibition purposes.

A combine of local buyers of grain at Lewiston, Idaho, has forced down the price until farmers are storing and refuse to sell.

Angora goat men are planning for a great exhibit at the January meeting of the National Wool Growers' Association at Portland.

The Division of Forestry, Department of Agriculture, Hawaiian Islands, distributes trees to planters who will put them out on Arbor Day.

The Indian boys in the farm department of the Chemawa Indian School made success of growing prize potatoes during the past season.

The completion of the Furnish-Coe dam across the Umatilla river at Coe Station, Oregon, will make possible the reclamation of 10,000 acres of rich land.

The sweepstakes winning at the National Apple Show at Spokane was made by a carload of Spitzenbergs grown at Hood River, Oregon. The price consisted of $1,000 in gold and a banner. The recorded score showed 997 points.

The Koa, which is one of the valuable trees of the Hawaiian Islands, is reported to be dying and the Bureau of Forestry has been asked to make an investigation and recommend method of saving the trees if possible.

The worst thing we have to contend with in getting new customers to try

West Coast Egg Food

is the "stuffs" that have been put on the market called "egg foods," largely composed of unsound grains, mill refuse, and cheap, very cheap, Japanese rice bran and such offal. When we once get a trial of "West Coast" we have no further trouble. No such stuffs in ours. We are winning out in great shape by making first-class feeds at prices as low as those "cheap" ones. Try "West Coast" just once. 75-lb. sack only $1.80, or $45.00 per ton. If not sold by your dealer, send to us. Or, if you are distant from Los Angeles and have good grain products cheaper than to ship them in, you can make your own Egg Food as good as anybody's.

Egg-More Booklet

tells you how. It is free. Send for it. Send us addresses of 5 persons in your vicinity who have fowls, and we will send you an Anchor Egg Separator. Or, for 20 addresses, we will also send The Poultry Manual, a book well worth 50c, both postpaid.

West Coast Mill

Office and Salesrooms, 115 Winston St.
Los Angeles, California

Coulson's

EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying powers and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the famous Coulson products and gives valuable information about Poultry Raising.

Practical Poultry Culture

THE POULTRY HOUSE.

By Henry Langenschwadt, San Jose.

The hen spends sometimes nearly half her lifetime in the house you provide for her; probably more, rather than less that time. This fact alone should impress us with the importance of properly housing her, if it is desired that she give us best results.

If you are to accomplish a great amount of work well, it will be done best under comfortable conditions. See that the hen is kept comfortable, and you have one of the essentials for enabling her to earn for you. Keep this fact before you in building the house.

We must adapt our methods in keeping poultry to the particular locality where we are living. The climatic conditions, seasons, soil, altitude, foods available, etc., differ, so that what can be put into successful practice in one section would often be altogether out of the question in another. To a great extent this fact is true of housing poultry. One must take into consideration many points, some of which naturally are peculiar to the locality. A great variety of poultry houses are to be found in the different parts of the country. Seldom will you come across a house that is the exact duplicate of one previously seen. The builders generally worked out the plan to suit themselves, and often endeavored to adapt the house to conditions prevailing.

Before we choose the site for the house, might it not be well to say a few words about the character of soil where the chickens are to run? When large numbers of chickens are kept, particular attention should be given this point. Where a small flock is kept, it would not be noticed so much. It is not absolutely necessary that chickens have a certain kind of soil to do well. At the same time, don't think, as some do, that any old soil is good enough. Experience will teach you what the difference is. There are some much to be preferred to others. For ourselves we would choose a light, porous soil, and avoid the heavy clay and adobe. The latter are bad in wet weather. If not worked properly at just the right time, they make very poor ground for chickens to be on in dry season. Certainly, where one has no choice, make the best of what you have.

Choose a site for the house on ground high enough so as not to have standing water around it when it rains. Let it be conveniently situated, easy to get at.

Chickens should have plenty of green food. If they have their range where it is growing, it will save time feeding. Besides, they can help themselves as they desire it. Sunshine around a poultry house is very desirable and necessary to promote the health of the fowls. If there are high winds, have the house sheltered from them if possible.

As to styles of houses, there are many in use, their merit varying. Some you would not want to use for a pattern. What is the best kind of a house? Would it not be well to go over some of the points we want to consider? Then we shall be better able to work out and decide upon the plan.

We want the hens to do their best for us. They must be kept comfortable. More attention sh[illegible] be paid to this point than generally is. While we do not have the extreme cold weather here on the Pacific Coast, the nights are much cooler, making the range in temperature between day and night as great or greater than where cold winters are experienced. To give plenty of fresh air, and yet not expose the hens to cold nights and mornings, is what we ought to try and do. The question of ventilation that is just right is a hard one to solve. By all means avoid drafts. If you don't, you will open the way for sickness such as colds and roup. It is not so many years ago when it was the belief, and to some extent is yet, that a tight house was best to keep the hens warm. It was thought they would lay better then. Little ventilation was provided. If air was changed too much, it would be difficult to keep the house warm. We have seen houses in which 50 to 75 hens roosted, with an opening of less than a square foot to admit fresh air. Is there any wonder that cold and roup developed among these hens? Why would there not be, when the hens came from the heated and damp air inside the house out into the cool air early in the morning? You would have a cold under the same conditions. Why not the hen? A constant supply of fresh air in the house is as essential as food to your hens to keep them healthy and vigorous, as they must be, to be good producers. No drafts, plenty of fresh air, and yet do not expose the fowls too much to the cold nights; protect them from heat when days are hot, and from the rain, and admit sunshine liberally—all are points that hinge together to be considered in house construction.

Shall it be just a house for roosting, or one which will provide shelter and a place for exercise in rainy weather? It seems to the writer that a house with scratching shed can be used as well here in California as where there is freezing weather and snow. While we do have milder weather the year round, permitting chickens to be out in it, yet there is more or less rain in winter months, sometimes for days at a spell. It comes at a time when the hens should not be without exercise, because the eggs are desired for hatching. In fact, to give the average flock exercise, a feed of grain each day, scattered in a deep litter of straw, would certainly benefit the hens and help keep them in good vigor. A scratching shed would come in well. It could be used not only in stormy weather, but in the dry season, when ground is bare. Grain fed in litter will give hens needed exercise.

A certain man had a fine lot of hens. They had good care and plenty of food. They did not pay—and why? The grain fed was practically poured in a heap on the ground. In a few minutes the hens had their fill. They lay around all day, and got fat. If they had had to work for that grain a couple of hours, they surely would have been in better shape to lay eggs. Another man made money on his hens. When the price of eggs was high, he got his hens to lay. Most others were getting few or no eggs at all. He had scratching sheds built beside his roosting houses. The hens were never without their needed exercise, scratching for their grain in litter, and at the same time were protected from wind and rain. There are many items which

60,000 "Queens" in the Contest

all along the line last year, and the Queen never fell behind. Friends, you will be interested in knowing about the uniform big hatches produced by the

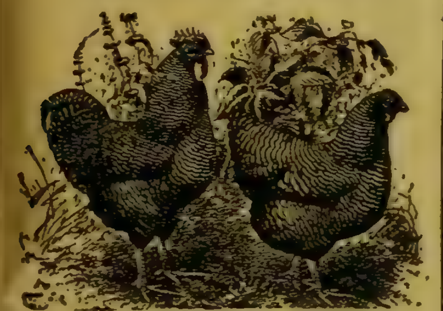
Box 53, Lincoln, Neb.



To the Poultry Raisers:

Do you want sick, mopey chickens, or do you want strong, healthy ones? Above are the kind of healthy chickens found on a ranch where Merval is used. Why not give your chickens Merval and have strong, healthy birds like these?

Merval will cure Roup in a week, and other diseases such as Canker, Chicken Pox and Diarrhoea in ten days.

Merval is also a fine tonic for run down hens. It puts them into condition again, which means more eggs.

Get a can from your dealer today. If he does not sell Merval, send us one dollar and we will forward you a one-pound can, postage paid.

Do it now. Remember, Merval won't cure dead birds.

when given proper attention will change a loss into a profit.

The scratching shed can be made adjoining the roosting quarters, or both can be put under one roof. Dropping boards can be placed about two feet above the ground, and the roosts above these. That will leave the entire floor clear, so that it can be used for scratching litter.

Earth makes the cheapest and best floor in a poultry house. It can readily be removed to the depth of a few inches from time to time. There may be instances and styles of houses where you could not use it, and some other material would be advisable.

Make the house high enough so that you can easily do the necessary work in it, of size according to the number you wish to keep in it. Some do not put over forty to fifty hens in a house. Others will put seventy-five to a hundred. When a greater number than this is placed in a house, it is said the egg yield is not so good, though we have seen 500 in one house, where a more than average egg yield was obtained. It cannot be said that this was to be directly attributed to the house, or whether there were other reasons for it.

One must get familiar with local conditions of weather, and use judgment in the matter of ventilation. We would hardly advise using the so-called ventilator. Be sure to avoid drafts. Probably no better method of ventilation is to be had than to have either the whole or part of the front of the house left open, and all other sides closed tight. Such an opening would at the same time admit sunlight. A burlap curtain could be provided, to let down all or part of the way when nights get cold. When cold enough to keep this curtain down, there will be a constant change of air in and out through the burlap. Where winters are severe, a curtain before the roosts is often used. The opening could be covered with poultry netting to keep out unwelcome visitors. Face the house so that prevailing winds will not come into the front, and yet so that all the sunshine possible can enter.

It does not get cold enough along the coast in winter to injure fowls kept in an open front house. Yet, if you wish to secure your eggs during the fall and winter months at the least cost, it might be advisable to use a curtain to close part, or may be the whole, of the open front. This would add to the comfort of fowls in severe cold spells, giving you more eggs with less food consumed. The food that the hen eats goes in part toward supplying bodily heat. If consumed to keep her warm, there will be less for eggs. It is from food beyond that required for bodily maintenance that eggs are secured.

Yet, as long as drafts are provided, we believe it would be better to have too much ventilation than too little. If ventilation is poor, your house is liable to be close and damp during the night.

While having an open front house, we want to keep in mind to protect hens from wild animals—skunks, etc. Then the inside fixtures, such as roosts, nests and dropping boards, should be made so that they can be removed and easily cleaned. You will especially appreciate this should you ever have occasion to fight mites or other vermin.

Don't buy screenings for feed. Buy good wheat or corn.

SIMPLE CURES FOR ROUP.

1. When first the cold is noticed, put a bit of bluestone in the drinking water, a piece as big as a navy bean in a quart of water, not any stronger. This is a germ killer, dries up the cold in the head, is a disinfecant and will prevent the other chickens from catching the disease. So if any chick takes cold, put this into the water of the whole flock to prevent the disease spreading.

2. For a common cold, a pill of quinine and one of assofoetida, one grain in each, with half a teaspoonful of cayenne pepper, will frequently cure a cold in one night.

3. Take of lard two tablespoonfuls, vinegar, mustard, cayenne pepper, each one tablespoonful; mix thoroughly, add flour enough to make stiff dough. Give a bolus of this the size of the first joint of the little finger. One dose frequently cures; if not, repeat in twelve or twenty-four hours.

4. For diphtheritic roup peroxide of hydrogen is without doubt the best remedy. Dilute with from one to three parts of water. The solution when applied to the diseased surfaces should be repeated until there is no bubbling. When a little of the solution is forced into the nostrils by the use of a dropping tube or an atomizer, it will be driven high up by the force of the foaming, reaching parts otherwise out of reach.

5. Equal parts of powdered alum, magnesia and sulphur blown into the throat and nostrils through a quill.

6. For canker, four grains of sulpho carbolate of zinc to one ounce of distilled water. Paint the canker spots with this night and morning, and in two or three days the germs will be killed. The chickens should have nourishing food, such as bread and milk and chopped onions. If there is any doubt as to whether the disease is canker or roup, you had better use the peroxide of hydrogen one day and the zinc the day following, alternating the treatment. It will not do to mix the two medicines at the same time, as one will neutralize the other.—Coleman's Rural.

CRUELTIES IN THE POULTRY YARD.

It is surprising how many people, otherwise model citizens, are guilty of cruelty to both fowls and animals. It may not altogether be intentional on their part, but nevertheless they do things that call for censure.

One of the most common acts is to carry chickens by their legs, heads down. This cruelty has been practiced for years, and no one ever thought anything about it. They did not notice the rush of blood to the head of the fowl when carried that way. A neighbor just the other day was carrying a fat hen by the legs, and in a few minutes the bird was gasping and came pretty close to choking to death. An equally cruel method is to carry fowls by the wings—especially so when the fowls are heavy bodied. The proper way it to allow the fowl to rest on the arm, the legs held firmly by the hand; or it can be held between the arm and body.

A dealer was one day noticed to yank killing stock out of a crate, by catching by a leg or wing, and otherwise roughly handling them. When remonstrated with he replied that it did not matter, as the birds would soon be killed.

With some people it is common to throw fowls over the fence into a yard. There is no telling in what manner

they will reach the ground, and when this cruelty is performed while the attendant is in a fit of anger, there is considerable force put into the throw.

A very pious old gentleman was vexed to the cussing point because his chickens happened to get out of the yard, through a broken fence, into his garden. In his anger he threw a stone and lamed one of the fowls. "There, it serves you right; I don't pity you a bit," was the only comment on the accident. How much better it would have been to have carefully driven those fowls back into the yard and at once repaired the fence.

Verily, the contrariness of the hen is "not in it" with the contrariness and stupidity of some of the attendants.

A common cruelty is to overcrowd the flocks, especially in close, badly ventilated houses. Allowing the supply of drinking water to run out, and placing the drinking vessel out in the sun, are also cruelties practiced by shiftless, lazy people.

Many acts of cruelty can be named in the methods employed in breaking up broodiness in hens. For instance, dousing them in water, tying them by one leg to a stake, or throwing them into a yard of young cockerels to be knocked about right and left, are all practices that should be stopped. Broodiness is a provision of nature to rest, and certainly the industrious hen deserves it. But if it is wanted to have her change her ideas or condition, the only humane way is to place all such in a separate house where there are no nests nor male birds, and allow them to gradually have the fever pass off.

For some years back it was the custom to sell little (newly hatched) chicks at the poultry shows, and also at large bird stores around Easter. These innocents were bought by fond parents for their little tots, and carried to their homes in pasteboard boxes. Without the proper brooder heat, or the right kind of food, these little chicks would be slowly tormented to death, quite often, too, by rough handling from the "cute baby." But it is now so now. The Society for the Prevention of Cruelty to Animals has taken hold of the matter and will no longer allow this uncivilized cruelty.

Anything that will inflict needless pain, or make the fowls uncomfortable, should be punishable. It is surprising how many people, who otherwise are kind-hearted and good, will not stop to think that their very acts are uncharitable and unchristianlike.—American Cultivator.

HOW PULLETS TAKE COLD.

Do not allow the pullets to roost in the coops where they were raised. The cooler the weather gets the worse they will crowd. They will suffer from the heat, and when let out these cool morning are apt to take cold, and roup is the next thing on the programme. The pullets expected to lay this month should be roosting in a comfortable house at this time. —Farm Journal.

POULRY DROPPINGS.

Store poultry droppings in barrels in a dry place. Mix with an equal quantity of leaf mold and you have a valuable fertilizer. It is very rich, a little will go a long way, and if carefully applied can be made to pay for all the feed the poultry consumes.

Poultry roosting in trees is not exempt from insect enemies. This has been proved by the experience of many who make a business of raising poultry. An examination of the limbs of trees where the young flocks roosts at night, before the birds have been yarded and housed for the winter, will show countless numbers of mites resting under the loose bark. Chickens generally seek the same roosting place night after night, and carry insects with them. The tree becomes infested and the vermin increase in numbers with wonderful rapidity; finally sapping the vitality of the birds. Then farmers wonder why food does not fatten. When birds are old enough to "climb trees" they should be placed in coops that can be easily disinfected and kept in a healthy condition, if the best financial results are expected. Such is the advice of the poultrymen at the Minnesota University Farm.

GREEN BONE FOR EGG FOOD.

There is no disputing the fact, green bone is an excellent egg food and one of the best substitutes for worms for fowls kept in confinement. It is likewise excellent for growing stock. One producer has fed green cut bone twice a week, and allows about a pound to every sixteen head of grown stock, and half the quantity to that number of growing chicks. To feed green bone oftener than that or in larger amounts is apt to produce bowel troubles and worms, and also grow the combs too large. Too liberal feeding of fresh meat it apt to make fowls irritable and cross.

In treating sick fowls, put them in a temporary hospital or coop isolated from the poultry houses. Fowls usually get sick because of wrong conditions; naturally it is difficult to effect a cure without removing them from these conditions. A bird with a roupy cold, caught from a draft through a knothole, is not apt to recover until it is taken away from the draft, or the knothole is stopped up. See that the chickens have dry, well-ventilated quarters. Feed and water them well, and there will be little sickness among them.

I wish to give the record of an even dozen of "common" hens that were fed three quarts of milk, whole barley and wheat with green alfalfa to complete day's ration during the past three months. I have kept an accurate record during the months of September and October. During the first month they laid 203 eggs and during October 135 eggs.—E. L. DeWitt, Vacaville.

Start the trap nests so it can be known which are the best winter layers. Almost any old hen will lay in spring and summer; it takes a good hen to lay in late fall and winter.

POULTRY SHOW DATES.

Petaluma, Cal., Dec. 8-11, 1910. Fourth Annual Poultry Show of the Petaluma Poultry Association. H. R. Campbell, Secretary, Petaluma.

MORE CHICKENS—MORE EGGS AND MORE PROFITS

Big demand for poultry products at top notch prices—makes the chicken business *better than ever.* Go into it *right.* Pacific Coast poultrymen testify that

Cyphers Incubators and Brooders

the World's Standard Hatchers, give the *best results* in meeting Coast conditions and requirements. The Cyphers is a genuine non moisture incubator; self-regulating, self-ventilating. It is used by more Government Experiment Stations, by more poultry fanciers and on more big and successful poultry plants than *all other makes of incubators combined.*

The Cyphers Is Particularly Adapted to the Pacific Coast Climate

You can rely upon the results from the Cyphers—*hatch after hatch.* Mr. C. Flewelling of Petaluma, Cal. uses 14 Cyphers and averages 75% of the total number of eggs set. Bertha M. Story of Oregon City, Ore. says "I rarely have less than a 90% hatch of good strong chicks." Cyphers Incubators and Brooders are fireproof and insurable. We guarantee Cyphers Incubators and Brooders absolutely and are right here on the coast to back our guarantee. Write today for our big handsome book: "Practical Poultry Raising" and 1911 catalog of Cyphers Incubators, Brooders and Poultry Supplies.

THE WEEKS BILL.

The Weeks bill is national in its scope. While its proponents have the Southern Appalachians and White Mountains in mind as the regions most vital at present, in which its principles directly apply, it will be noticed that they may be applied to any sections in which the necessity may exist or arise. It is reasonable to suppose that in the application of its principles the Southern and Eastern sections of the country would be given first consideration because of the greater necessity in these sections for immediate preventive and protective remedies.

The objects sought in this bill appeal to every American on grounds of broadest and most unselfish patriotism. It is the first step in the direction, and fundamental to, the great movement for the conservation of our natural resources which is the vital point round which the constructive thought and statesmanship of the present are building for the future. It is the most practical and immediately necessary of the conservation measures that have been proposed and was strongly pointed out to be such by President Roosevelt in enunciating the conservation policy. It involves the smallest initial expenditure, the least possible future expenditure, and the surest return upon the investment, judging from the experience of every country that has practiced for a sufficient term of years a comprehensive and efficient policy, of any project embodied in the conservation movement It seeks to conserve the richest of our national assets from serious impairment if not destruction—our navigable waterways.

The bill involves an issue of national equity and appeals strongly to the nation's sense of equity without regard to section or party affiliation. Years ago the original states of the East obtained by purchase and cession a great national domain west of the Mississippi. Out of this domain many of the states of the West were carved and endowed with all the rights of the original thirteen. To their development the older states contributed by liberal legislation, investments, and by the initiation of great national improvement enterprises for which the whole country, not the new states alone, contributed the funds. Finally, for the good of the whole, for protection and welfare of the future of this Western country, the nation took out of the market millions of acres of its lands, gave up its expectation of returns to the amount of over $400,000,000, in which all would have shared, in order that beneficent forests might be maintained in perpetuity in the Western mountains, that a supply of timber might be assured for all time to the people of these states, and that the necessary flow of their streams might be maintained.

In the meanwhile, the crowding of civilization, the insistent demands of the market, the wasteful manner of handling and the ravages of fire had been devastating the Southern and Eastern mountains, which had passed into private ownership long before it was realized that there could ever come a time when the necessity of conserving the natural resources of this rich country would become an issue of supreme importance alike to the present and the future. Not only was the timber supply threatened with exhaustion, but the flow of numerous rivers, whose waterpowers furnish so much wealth and employment, was in jeopardy, and, through erosion, silting and irregular flow, the navigability of many of them was endangered. The plea of the people of the Northeast and Southeast for relief was brought to Congress more than a decade ago, and is now before Congress in this bill.

Along with the national irrigation work of the West, the hundred and ninety-odd million of acres of national forest in that same section, the gift to the world of the Panama Canal, these people of the South and East appeal for the expenditure—more properly investment—of a few million dollars conservatively applied to initiate in their mountains a conservation enterprise which is in line with the past policy of the Nation in other directions, and of every first-class power in the world. It is a movement which the states themselves are unable to initiate. They have neither the power nor the resources, nor is it a duty which they alone can be asked to assume. Every state of every section will benefit by the conserving of the timber supply, water powers and navigable streams of our Southern and Eastern mountains. It is a national duty which neither in equity nor wisdom this Congress can longer shirk.

Every year of delay increases the loss of our resources in these regions. Each year of postponement of action adds to the loss and the ultimate expenditure which shall have to be made when necessity forces us ultimately to acquire and control these forests. It is a short-sighted policy which blinds us to the lessons of history and the experience of other and older countries.—From Report of Commissioner of Agriculture.

SURFACE WATERS OF CALIFORNIA.

During the last five years investigations of the quality of the water of streams in California have been made by the United States Geological Survey in co-operation with the State Department of Engineering, and a report of the work done has just been published by the Survey as Water Power Paper No. 237, by Walton Van Winkle and Frederick M. Eaton.

Thirteen Hundred Analyses.

Samples of water were collected daily for one year at 37 points on streams in the State and were analyzed to determine their mineral content. Single samples were taken at 14 other places and these also were analyzed. The University of California courteously afforded laboratory space for the analytical work. The report presents the results of more than 1,300 analyses of water, gives descriptions of the streams and drainage basins, and shows the sources of water supplies now provided and the methods of sewage disposal.

All Kinds of Water in California.

Practically every kind of water is found in California, so that the mineral content of samples taken from different sources differs widely, ranging from 100 parts per million in the soft waters of the Sierra to 200,000 parts per million in the waters of Owens Lake. The minerals are, of course, derived from the rocks and soil traversed by the streams. The rivers of the northeastern part of the state receive but little mineral matter from the almost insoluble granitic rocks over which they flow. Those of the coast, which drain areas composed in large part of loose sedimentary deposits, leach out much greater quantities of minerals.

Importance of Long-Continued Work.

The report shows the importance of making a series of analyses of samples collected during a long period and proves that analyses of single samples taken from any

Citrus and Tropical Fruit Trees

5000 Eureka Lemon trees
5000 Valencia Late Orange trees
5000 Navel Orange trees
3000 Grafted Walnut trees
500 Budded Avocado (Alligator Pear) trees

People who intend to plant lemon or grafted walnut trees this season will have to secure them from some source early as they are now very scarce.

stream may give entirely erroneous ideas as to the average quality of its water. Samples taken at the same place at different times show great differences in character.

Influence of Rainfall.

Rainfall is an important factor in determining the mineral content of stream water. The average mineral content of the surface waters in regions commonly called semiarid is about four times that of the surface waters of humid regions. The analyses show that the waters of the semiarid parts of the state contain proportionately less calcium, more alkali, less carbonates and much more sulphates than those of the humid region. None of the water examined from streams of the semiarid parts of the state is of good quality for industrial use, and railroads in those regions have great difficulty in procuring water suitable for locomotive boilers. The best waters for use in boilers are those of the orange belt of Southern California.

Some Uses of the Analyses.

By means of the analyses given in this paper the chemist can determine the proper treatment of waters needed for industrial uses or can select proper sites for factories that require water of a special character.

DRY FARMING BULLETIN.

The United States Department of Agriculture has for several years been carrying on investigations and accumulating data regarding dry land agriculture in the Great Plains, and in compliance with the urgent demand made by settlers, actual and prospective, for information concerning the best methods of farming in that section, it has issued two bulletins giving publicity to such facts and figures as have direct bearing on the subject, although it is not claimed that sufficient data have been accumulated to form a basis for final conclusions.

The results announced are, however, of sufficient importance to deserve careful consideration, and they throw strong light upon the controverted questions of summer tillage, continuous cropping, and crop rotation, and show that in addition to actual rainfall the questions of evaporation and run-off have much to do with the successful production of crops in those sections. Accurate information regarding the precipitation in many sections of the West is now available as the result of the extended operations of the United States Weather Bureau; many of the records are complete for years, and being of value to the prospective settler, have been computed in rainfall tables and have been included in the bulletins.

The bulletins treat to a greater or less degree upon continuous cropping as compared with alternate cropping and summer tillage, upon crop rotation compared with continuous cropping, and the relative farm value of crops of wheat, oats and barley as produced by the various rotations and by continuous cropping. The question as to the relative merit of disking the corn stubble for spring wheat and oats and summer tillage, and the relative merits of fall and spring plowing receive considerable attention and are discussed in one or the other of the bulletins in connection with the distribution of rainfall, rapidity of evaporation, and the amount of moisture conserved by the different processes.

Prospective settlers are apt to give very little attention to the climatic features other than the total rainfall. Oft times they do not even assure themselves that the figures given for a particular region represent the normal rainfall and not simply the rainfall of a single year. They ignore almost completely the frequency of torrential rains, the seasonal distribution of the rain, the loss of water through water run-off, the occurrence of hail, and the amount of evaporation. These bulletins are intended to bring the importance of such factors to the attention of the prospective settlers in regions of limited rainfall. The bulletins also contain tables showing the normal rainfall for practically every station in these regions where precipitation records are available, the tables being supplemented by state maps showing at a glance the distribution of the rainfall in the state.

SUB-IRRIGATION.

We don't know whether Florida is simply undergoing the sub-irrigation spasm which California experienced twenty-five years ago or whether it has something new which will prove of value. We are reasonably sure it is the former. It has been talking sub-irrigation for some time. In a recent Florida, Fruit and Produce News we note the following from an enthusiastic believer:

"Let me describe the system, its operation and theory, and tell what it has done for us of Sanford. Its possibilities seem limitless. Without an illustration or drawing, a description is difficult to understand or remember. Briefly, the water is applied through three-inch tile, laid in parallel ditches eighteen inches deep, with a fall of not less than one inch to one hundred feet. The distance between the rows of tile varies according to quality of soil; in sandy loam, twenty-five feet affords effective drainage, as well as irrigation. The more clay, and the stiffer the soil, the nearer they should be placed. At the upper end of the tile, beginning at the water supply (with us, flowing or artesian wells), and running by the end of each row of tile, is the water main, the cheapest being small sewer pipe cemented at the joints. Between the tile and this water main a joint of six-inch sewer pipe is used as a standpipe, connected by a short iron pipe on one side with the main, while on the other is the connection with the tile. It will readily be seen that water turned into the water main, and running by each of the standpipes, can be turned into as few or as many as desired, in this way irrigating all or any portion of the field. Of course, the tile is in short joints, with us one foot in length, and the water finds ingress or egress at the joints, porous tile being more or less a myth. At the lower side of the field the tile discharges into a waste ditch, and when the ground is level and the flow of water not too rapid, it will be found that capillary attraction supplies all the moisture needed, even for setting plants, but most fields are equipped with stop-boxes at the lower end of the tile, and when the ground is much broken these boxes are placed at intervals, as required, even to flooding the ground.

"This much for irrigation. It is quite as effective for drainage, being laid on an incline, and water applied by gravity. In case of rain the excess is taken off very rapidly, and on our soil if it rains three inches today we can plow tomorrow. This we find is of inestimable value, for the soil saturated with water cannot be worked; as the small boy would say, 'there is nothing doing,' or, as a Western farmer put it, 'you can't get no action out of the ground.' The reason of this inertia, as all know, is that the water excludes the air from the ground. Now, with surface irrigation, and without this sub-drainage, you have to wait for the water to evaporate, which slowly drying on the surface, inch by inch, lets in a little air from above, while the plants await the life-giving air. With our system, as soon as the water stops running the tile becomes a conveyor of air, which is supplied from both top and bottom. Our system not only does these things, but furnishes warmth from below, and as warm air rises from the tile it has a marked influence on the growing crops, especially in winter, when our most profitable crops are grown, for with us September or October is seed time, and February and March the harvest. You can understand that it matters little to us whether it rains or not, for during the winter of 1906 it rained frequently and in torrents, while the next year we had not a single rain from September 15 to April 5, yet raised equally as good and profitable crops. So rain is not necessary to plant, grow and perfect a crop."

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Grapevines.

Should grape vines be sulphured for the red spider when in blossom or just after the blossom falls and the grapes are setting? Also how can the vine hopper, a tiny fly-like insect, be destroyed? Have noticed that some vineyardists turn sheep into the vineyard in the fall to browse on the leaves and vines. Are they a benefit in any way or an injury?—Subscriber, Delano.

Vines are not sulphured for red spider except when it appears. Liver of sulphur is used on vines as a spray for red spider. This is a cooked spray and few care to bother with it. The simpler way is to cultivate better and to winter irrigate the vineyard well enough to overcome the dryness of the soil and in that way control this pest. The sulphuring when in blossom is for mildew and the red spider appears later in the season. The vine hopper question was discussed and illustrated in the last issue. "Sheeping" vineyards was a way that we used to control the hoppers as the complete cleaning off of leaves and the tramping into the ground lessened the hoppers the next season. The vines are not injured in any way as far as I can see, and the sheep leave in their droppings considerable fertilizer. On the other hand they tramp the land hard and if the rainfall is light it makes it much harder to get the land into good condition of tilth.—M. E. S.

Substitute for Milk.

What is the best substitute for milk for a week-old calf?—J. W., Monrovia.

Hay tea, made by infusing alfalfa hay in a closed can. The tea should be dark in color. Cook a little flax seed to a gruel and add a tablespoonful to each quart. Feed the calf four times in twenty-four hours the first two weeks, and then three times a day until it begins to eat grass. If more convenient, oatmeal may be used instead of the ground flax seed. We have used bran tea with good success, but the bran nowadays has little substance. The only thing to observe is to make the food fresh and feed it warm, and not overfeed it. Alfalfa meal may be more convenient to make the tea from, and seems to give good results when we have used it for young pigs.—M. E. S.

Grafting Peaches.

My peach trees are eight years old, all seedlings. Can they be grafted, and what is the best time?—Subscriber, Sanger.

These peaches can be grafted to peaches, plums or apricots, successfully. The best time for work is when the trees are perfectly dormant, say in February or March. Soon before blossoming time is better.

Roup.

What is the trouble with our laying hens? They eat well but their eyes are affected; one of them has become blind; others have thin skin over eyes and cannot see. One of our neighbors has poultry affected in same way. We are feeding sugar beets. Will this do them good or not?—Subscriber, Lodi.

This is too limited a description of the trouble to enable us to be sure of the cause but would judge it to be roup. Would refer our subscriber to page 62 of our issue of July 21st. In a word, thorough cleaning of premises, moving well birds to clean, new corral if possible, and using care to disinfect roosts and houses will greatly help. Feeding sugar beets at this season of the year when there is no green feed is all right for adding succulence to the ration, but they have little nutritive value.

Bourbon Red Turkeys.

Where can I secure eggs of the Bourbon Red turkey?—Mrs. M. Goss, Madera, R. R. 1.

We are unable to learn regarding that turkey in this state and subscribers having information will confer a favor by writing to Mrs. Goss.

Poor Butter.

Since our cow freshened, the butter has not been marketable. In churning, the butter comes in four minutes, but does not separate well, and is not firm, though we churn at 58 to 60 degrees. By leaving butter stand over night and get cold we manage to mold it, but it softens at once as soon as the weather gets warm. We keep the milk cold for twenty-four hours before skimming. In milking, there is more foam than usual. Feed alfalfa and pumpkins.—Subscriber, Hemet.

In cases like this I would think the trouble was purely in overripe cream. The feed of the cows has not a great deal to do with the butter, except where some very concentrated foods, like cotton seed meal, are used.

In correcting this difficulty, first of all consider the cause as overripe cream. The globules of butter fat are already breaking down. Fifteen to twenty minutes is as quick as good keeping butter should come in the churn. When the fat globule is once broken, it can never be restored, and the butter has lost its texture. In the butter made from cream properly ripened the fat globules stand separate, with the watery portions of the milk between them. Churning is merely the forcing out of the casein and watery milk, and bringing these globules into close relation to one another, when a solid mass of butter is secured. The small spaces still left are then filled by the water carrying the salt in solution. Churning oftener will help, and ripening at a lower temperature will help. When not possible to churn oftener, salting the cream is often resorted to. Put a heaping tablespoonful of fine dairy salt into each gallon of cream. Stir it in well, and whenever adding fresh cream, add salt in the same proportions. Have the cream added at the same temperature as that already on hand, and stir it well. The butter will probably not require any more salt added to it than this, but that is a matter of taste. A few trials will show you how much to use.

When the butter comes and is the size of grains of wheat, not larger, run off the buttermilk and cover the butter in the churn with as cold water as possible to obtain. Then scald and cool off the butter bowl and paddles. Rock the churn five or six times, and slowly turn it over by hand a couple of times. Then run off the water, let the butter drain, and put on the worker and work at once. It may be made into rolls now, or it may be stood away for several hours and then made

EUCALYPTUS TREES

Unsolicited Testimonial Just Received from Large Ranch in Kern County:

"The Eucalyptus trees arrived in excellent condition; and were the thriftiest, stockiest, and altogether the finest trees ever received on this ranch"

We have large stock 18 months' old trees for early planting, and also 9 months' old for later planting: to see the stock will convince anyone of its quality and hardiness; prices right.

More Money For You

Greater productiveness of trees—larger, cleaner, and finer fruit—more money. Isn't that fruit growers' reasoning? Nothing will contribute to this end more than effective spraying. And **Effective Spraying** can best be attained with

Bean Magic Spray Pumps

Effective spraying means **High Pressure Spraying** and till the advent of the Bean Magics a high pressure could not be maintained with a hand pump for any length of time, on account of the body-racking effort needed to operate it. The Bean patent spring divides the work between the two strokes of the handle and works against only one-half the pressure shown on the gauge and saves exactly one-third the labor.

Our illustrated catalog No. 21 describes ten sizes of hand pumps, and contains much valuable spray information, and formulas. Catalog No. 22 describes Power Sprayers. Both books sent free. Write for our special offer; state number of acres and kind of fruit.

California Cultivator Clubbing Price List

FOR THE SEASON 1910-'11

Prices are Good to Oct. 1, 1911

This magazine price list is prepared annually for the convenience and benefit of Cultivator subscribers. The prices given allow our readers the benefit of the lowest figures possible, in return for which, all we require is that to all orders a year's subscription to the Cultivator (class 18) be added at 90c (regular price $1.00 per year).

This year the pricing of various combinations of magazines is a simple matter; all are listed according to class number and this class number multiplied by 5 gives the cost price.

EXAMPLE:

Class No.		Regular Price
20	American Magazine	$1.50
16	Delineator	1.00
37	World's Work	3.00
18	Cultivator	1.00

91X5=$4.55. Club price for all. Amount saved on this club, $1.95.

We desire to especially call attention to this complete list of the most popular magazines. We can, however, supply any periodical published, at the lowest price, and any not listed here will be quoted on request. Let us make you a price on any combination you may desire.

Periodicals in any combination may be ordered to the same or different addresses. Foreign or Canadian subscriptions are extra on account of added postage and prices must be gotten by correspondence. Subscriptions may be either "new" or "renewals," but it is important that this information be given in each case.

Books—Send us a postal for our list of agricultural books which we supply subscribers and which we recommend as most suited to California conditions.

Don't overlook this special:

The California Cultivator (weekly)
The Rural Californian (monthly)
} Both one year for $1.50

Our Money-Saving Combinations:

The price of the Cultivator and any single magazine may be obtained by adding 90c to the class price of the magazine desired.

Make up your orders from the following, noting that the class numbers multiplied by 5 gives the cost price. Also bear in mind that **all orders must include a year's subscription to the Cultivator (class 18) at 90c.**

into rolls. Personally, I would work it carefully for about five minutes, not more, but less if anything, shape into rolls, and wrap at once in either parchment or cloth. The only reason for ever letting butter stand is that it might be too soft. I like to churn at fifty if possible, but often have had to churn at sixty, and it is possible to make good butter at sixty-five, but requires more care.—M. E. S.

Planer Shavings For Fertilization.

What is the value, if any, in sticker shavings, those produced by planing mills, for fertilizing citrus orchards? Shavings are of Oregon pine and redwood.—Subscriber, Escondido.

We saw one orange orchard near Los Angeles in which the experiment of using redwood shavings on about one-third of the trees had been tried. The application had been made the year before we saw the trees. The trees were yellow and carried but little fruit and looked most unthrifty, while the rest of the orchard not treated with application of shavings was bright green and in best of condition. The grower said that all other treatment of the trees had been the same. He insisted, and we have never heard it contradicted, that the redwood shavings were the cause of the trouble. We have heard others say that the Oregon pine shavings were not injurious. We imagine they would carry practically no fertility to the soil, but that the only effect would be mechanical. Any experimenting along this line should be carefully conducted; we should much prefer stable manure or green manure or other means of bettering soil conditions.

Legal Queries

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Polluting Water.

A small creek starts on A's land and runs through B's pasture. Can A empty his sewage into this creek so that the water flowing through B's place is unfit for stock to drink? Can B prevent this pollution?—Subscriber, Napa.

If B has a right to have the water flow through his land, he also has the right to have it flow unpolluted, and B's remedy would be an injunction.—E. L. P.

Pastured Animals.

Is a person owning land and pasturing stock for a consideration of so much per month liable to the owner for any damage to said stock like getting crippled, straying or dying while in pasture? What recourse would the owner of pasture have against the owner of stock when the owner of the animals was unwilling to pay the pasture bill?—Subscriber, Lang.

The owner of the pasture is liable for any injury to the stock which is occasioned by his lack of ordinary care. If an animal became crippled because the one doing the pasturing neglected to do something which an ordinarily prudent man would have done under the circumstances, or did something which an ordinarily prudent man would not have done, he is liable for the injury. The owner of the pasture has a lien dependent on possession for his compensation in caring for, boarding, feeding or pasturing the stock. If he parts with the possession he loses his lien.—E. L. P.

VETERINARY

Answers in this column by Dr. Fred G. Matthews, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Founder.

Can you give remedy for founder of five or six years' standing? E. R. T., Ferndale.

Chronic founder is incurable. The treatment pertains more to the domain of horse-shoeing than medicine. Some recommend flat wide-webbed shoes applied after the sole and frog has been cleared of unnecessary prominences and exfoliated horn. At alternate shoeings leather pads over tar and oakum may be applied. Blister the skin just above the hoof, entirely around the foot, at intervals of three weeks, with a mixture of red mercuric iodide, one drachm mixed in one ounce of vaselin, rubbed into the parts thoroughly.

Contraction of Hoof.

My horse is affected with serious contraction of one of his front hoofs. Above the hoof a number of sores are coming, but at present there is a new growth of hoof showing. The trouble is so serious that the horse is quite lame and walks on the heel of the foot. Can you suggest cause and remedy?—Subscriber.

It is impossible to arrive at any definite conclusion as to the cause of the trouble in this case, but if the lameness appeared suddenly one would suspect a deep nail wound near the middle of the frog. Have the blacksmith search the sole and frog carefully for evidences of a wound. Soak the foot one or two hours, daily, in a bath of warm water, to which creolin is added to make a milk-white solution. When dry cover the hoof—frog, sole and wall—with a hoof ointment made of one part pine tar and three parts lard.

Rupture.

A filly one and a half years old was observed about three weeks ago to have a painless enlargement the size of an egg on the navel. A few days later there appeared a soft swelling around the enlargement, which now extends forward almost to the fore limbs. A liniment, which was supposed not to blister, was used on the part.—Subscriber, Lemore.

Every indication in this case points to the formation of a rupture (Umbilical hernia) at the navel. Take a strip of strong canvas, which is long enough to almost encircle the body and wide enough to extend from the flanks behind to the middle of the rib region in front, and attach five strong rubber band elastics, equal distances apart, across one end, and to the other end fasten cords corresponding to the elastics. These cords should be so placed that when tied into the elastic bands any desired tension can be secured. A simple breast-strap harness can be arranged to prevent the canvas from working back into the flank. Prepare a thick pad of cotton, place it on the navel, and adjust the canvas band so that continual pressure will be applied to the part. It is doubtful if this will effect a complete cure, but the size of the rupture which remains will be materially reduced, and later the colt may outgrow the trouble. Feed only concentrated foods, avoiding the use of bulky foods which tend to distend the abdomen. In fact, it would be well to limit the amount of grain given and allow the colt to become gaunt.—F. G. M.

General Agriculture

COMFORTABLE QUARTERS FOR HELP.

The perplexing problem of harvest help which has been worrying farmers throughout the Pacific Slope has been satisfactorily solved by at least one man in this valley, says the San Jose Mercury. For the past four years Homer A. Craig, now president of the Farmers' Union of the Union District, has been employing white help solely in harvesting his crop of prunes, with gratifying results therefrom. Owing to the utter unreliability of the Asiatic help, Mr. Craig first tried the experiment of employing young people, but the amount of time wasted and the poor results accomplished soon convinced him of the futility of depending upon them without mature persons to keep their exuberance within bounds.

Then it was that Mr. Craig conceived the idea of employing whole families and the results attained have been beyond the most sanguine expectations.

With the beginning of the fruit season the families—usually the mothers and children only—move into tents, which, supplied with woven-wire mattresses and sheetiron stoves, are furnished by Mr. Craig. Here they live during the fruit season, gaining health in the pure country air and at the same time earning a better wage for the time employed than could be obtained in the city. They are paid "by the piece," so that their own industry determines the scale of wage. Those children old enough to work pick up prunes beside the mother, while the wee tots, happy in the freedom of the country, play contentedly in the swings which have been hung under the big shade trees for their special amusement. Safely bestowed under the mother's watchful eye, the child plays about all day, gaining health and strength, the little face growing tanned and ruddy, the cheeks filling out round and full. The women have discovered the utility of overalls, and, unhampered by skirts, they work in the orchard in "blue jeans" and shirtwaists, while even the children have donned the "prune-picker's uniform."

And, if the hopes of the Farmers' Union, who are vitally interested in getting help to harvest their fruit crops, are realized, the next Legislature will change the vacation period so that the school children, with their parents, may "go camping" in the orchards, and while they grow strong and rugged in the healthful out-of-doors, they will be forming habits of industry, thrift and independence.

State Superintendent of Education Hyatt, who is always interested in anything looking to the welfare of school children, has signified his willingness to co-operate with the Farmers' Union in its plan to change or extend the vacation period to conform with the fruit crop.

County Superintendent D. T. Bateman and City Superintendents McClymonds of Oakland and Roncovieri of San Francisco are equally enthusiastic. The children cannot be kept out of school, but if the vacation period could be changed by an act of the Legislature to suit the farmers' needs it would solve the question of labor in gathering the fruit crop, would give the child a change of air and occupation and pay him well, besides, for a pleasant outing. An industrious 12-year-old can easily earn from 75 cents to $1 a day and still have time for the "good times" which healthy children crave and should have. Mothers earn from $1 to $1.50 a day, and have no expenses to pay except for food. The prune crop usually lasts about six weeks, and if the vacation period be extended so that the children could cut peaches and apricots, the season's work would be lengthened to fully two months or more.

BANQUET TO NATIONAL UNION PRESIDENT.

The farmers of Chico, Butte county, are enthusiastic believers in co-operation, co-operation in marketing, co-operation if possible in buying. The Farmers Union there recently tendered a banquet to National President Barrett of Georgia, who gave them a rousing address on co-operation which is more the life of business than competition.

In the Chico Enterprise we note the following regarding Mr. Barrett's address:

To meet with the greatest possible success agriculturally, attain the widest influence politically, and accomplish the best results educationally, it is necessary for the farmers to organize themselves into unions.

This is the day of organization, and the Georgia man says that if men living by the productiveness of the soil want to keep up with the times, and get the most out of their land and out of the world in an educational and financial way, they must follow the example set by capital and labor and organize. The speaker asserted that greater difficulties were to be met with in organizing farmers than almost any other class of men, laying the blame for this, mostly on those men among them who grow impatient if they do not see immediate financial benefits.

"Why, some of them even expect to get twice their money back the very day they pay their initiation fee," Mr. Barrett said.

It was only seven years ago that the first union was organized, and only five years ago that the first national union was organized, and yet, with all the early failures and discouragements, the national now has affiliated with it 3,000,000 members, representing every state in the union, and is growing rapidly, and accomplishing wonders in the way of greater profits, greater educational facilities and greater political influence.

"The farmers do not need to organize a new political party," said Mr. Barrett. "All they have to do is to stand together and ask anything they want from the old parties, either one of them, and they will get it mighty quick. If they don't they have it in their power to put their representatives in the state and national governments out of office."

Mr. Barrett told of different business enterprises that had met with success under the guiding hand of the union. Throughout the country they

"Up-to-Date" Farming

This is the **FLOUR CITY** 30 h.p. Gasoline Traction Engine pulling ***ten 10-inch Stockton Gang bottoms ten inches deep in heavy adobe soil*** on the ranch of Jerome Bros. near Santa Ana, Cal.

Jerome Bros. write us under date of Nov. 29th:

> "The engine is entirely satisfactory in every respect. It will do the work of 30 head of stock. We can heartily recommend it to any one who has use for a tractor."

The **FLOUR CITY** is the best Gasoline Traction Engine made—the Gold Medal Winner of International Contests. It has vertical 4-cylinder motors giving absolutely steady pull on draw bar. Its extremely high wheels give great traction power and enable it to do its work on soft ground, in sandy soil or over ditches.

Not only a powerful engine, good for plowing and harrowing, but a splendid engine for running any kind of farm machinery. Made in 30 and 40 h.p.

Write us for description and prices—or better still, call on us and see these engines at work.

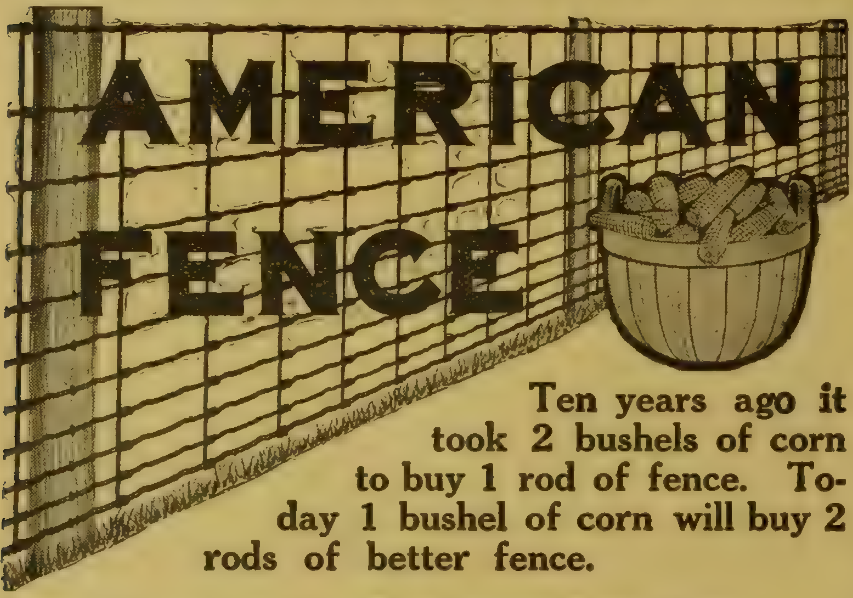
Higher Cost of Living Does not Include Fence



Ten years ago it took 2 bushels of corn to buy 1 rod of fence. To-day 1 bushel of corn will buy 2 rods of better fence.

Price Low—Quality Better Than Ever

Within ten years farm products have greatly advanced in market value while the price of woven wire fence has been reduced. These are the reasons: Newer and improved methods of digging the ore, shipping to the furnaces, melting into steel and making into finished products are in force. Ten years ago operations were on a small scale. Today the plan of operation is vast. The manufacturer is able to deliver the finished goods quickly, of better quality and at a lower price.

American fence is made better than ever. It is a thoroughly galvanized square mesh fence of weight, strength and durability. Large wires are used and the whole fabric is woven together with the American hinged joint (patented)—the most substantial and flexible union possible. Both wires are positively locked and firmly held against side slip and yet are free to act like a hinge in yielding to pressure, returning quickly to place without bending or injuring the metal.

Dealers Everywhere Stocks of American Fence are carried in every place where farm supplies are sold. The Fence is shipped to these points in carload lots, thereby securing the cheapest transportation, and the saving in freight thus made enables it to be sold at the lowest prices. Look for the American Fence dealer and get the substantial advantages he is enabled to offer. He is there to serve the purchaser in person, offer the variety of selection and save the buyer money in many ways.

STRAWBERRY PLANTS

My plants are grown in Tropico and on land never before used for Strawberry Culture. Plants are selected by myself for breeding and the blossoms always picked, therefore the strength grows into new plants This is why my stock will produce by far the greatest amount of berries. If you are going to set out 100 or 500,000 be sure and write to

E. H. LEARNED R. F. D. No. 5, Los Angeles

Grower of Strawberry Plants only, and only the best.

have their own warehouses, their own co-operative stores, and in many places they have their own factories. He mentioned a fertilizer factory in the South that has 4000 farmer stockholders that is paying all these stockholders profits, and that has succeeded in cutting the retail price of the fertilizer in half.

"The South is more strongly organized than any other part of the country," said Mr. Barrett, "but the unions also have much strength in the East and Middle West. The finding of new markets and orchard products, he said, was the way in which the union benefited the farmers financially, and by their voting strength they get greater educational advantages and other legislative benefits.

GROUND SQUIRREL EXTERMINATION.

A subscriber of the Cultivator has expressed a wish for the latest on Squirrel Extermination, and knowing of the extensive investigations and the work of the Public Health and Marine Hospital Service of the Treasury department, we wrote Surgeon Rupert Blue and from him have the following:

Methods of Ground Squirrel Extermination.

"One method, applicable during the wet season when the green grass is out depends upon the use of liquid bisulphide of carbon, which is placed in the holes. A second depends upon the use of poisoned grain.

"A common method of applying bisulphide is as follows: From one to three days prior to the application of the poison all squirrel burrows in the area to be poisoned are well stopped with earth. The holes found opened, on arrival of the poison squad will indicate to them the burrows containing squirrels. Two men working together can apply the poison most rapidly and economically.

"One man is provided with a supply of 'waste,' 'sacking,' or other absorbent material, divided into a number of small balls about half the size of the fist. The bisulphide is carried in an ordinary one-gallon oil can, and refilled from time to time from a supply kept in a cool place out of the sun. He is supplied with matches. His 'pardner' carries a long handled shovel. On arrival at an opened burrow, a small ball of waste is saturated with two ounces of bisulphide, dropped deeply into the burrow and a match applied. After a moment's time the man with the shovel stops with earth this burrow, and all other burrows near from which the gas escapes. On subsequent inspection of the field all opened burrows will indicate holes lacking effective treatment.

"During the dry season some form of grain poisoned with strychnine will probably serve the purpose best. A formula for the preparation of poisoned barley is as follows:

Whole barley	20 lbs.
Starch paste	1 pt.
Strychnine sulphate	1 oz.
Saccharine	1 dr.

"The barley is placed in a receptacle large enough to permit thorough stirring, (as a wash tub). One pint of water is then brought to a boil and sufficient laundry starch, (about two tablespoonfuls dissolved in a little cold water) is slowly added to form, when well cooked, a paste about the consistency of cream. The strychnine, (first powdered if in crystals) and the saccharine, are now added to the hot starch-paste and the mixture well stirred until dissolved. While still hot this is poured over the barley, mixed well, and the whole put aside for several hours before using.

"This formula is recommended because of its simplicity, cheapness and effectiveness. Scatter a teaspoonful along the squirrel trails or on hard bare places near the holes. The poison should not be placed in heaps on the soft mounds at the mouths of the holes. It will probably be found most efficient if scattered early in the morning, between the hours of 3 and 7 A. M."

Surgeon Blue adds that work has been done in 29 counties of this state.

"I have also to state that this service, working in conjunction with the California State Board of Health and others concerned, is carrying on a campaign of squirrel extermination at the present time which consists of the making of squirrel free zones about the transbay cities and the shooting, etc., of squirrels in other parts of the state in order to determine the extent of infection among them."

The Year Book of the Department of Agriculture for 1908 contains "Use of Poisons for Destroying Noxious Mammals" in which the ground squirrel is referred to. Reprint slips of that paper may be had by writing the Department.

PICKING COTTON BY MACHINE.

The machine itself is about as inspiring a sight as the gin was in Whitney's day. It is a small, gasoline, traction engine, with two picking attachments swung under it, and a pair of canvas bags hung out behind. It travels through the field about as fast as a man walks, taking the cotton plant between the wheels, where it is picked over by almost countless revolving steel fingers which catch the lint but leave the plant uninjured, so that the later bolls may mature. To leave the unripe bolls has been the great difficulty in making a mechanical cotton picker. Cotton cannot be gathered all at once like wheat.

Cotton bolls on the same plant mature and open progressively, making the problem of mechanically picking cotton extremely difficult. A cotton picking machine to be commercially successful must be able to pick the open bolls without injury to the unopened bolls and blooms, or to the foliage of the plant itself.

The picking machinery is on two drums which hang from the frame of the tractor, one on each side of the cotton plant as the machine straddles the row. An endless chain of upright cylinders of small diameter follow each other around the drum. From these cylinders the needles which do the picking project horizontally into the plant. When the machine starts, everything moves with a motion of its own. The drum carries the cylinders around; the cylinders poke the needles into the plant at the proper angle, and the fingers turn and catch the cotton.

Every motion is delicately adjusted. The fingers move fast enough to catch the fibre, but not fast enough to throw it off. The cylinders bring each finger into place at the proper time, so that there is never a space large enough for an open boll to pass through without touching a finger. The drum is moving backward at the same rate that the whole machine moves forward, so that the picking needles do not move horizontally through the plant, but merely turn in it.—Arthur W. Page in The World's Work.

OLD FARMING AND NEW.

Illustrated by pictures of a farmhouse of the old order, a barn and barnyard of the yet all too familiar type, a pen of long horn, scrub beef steers of the old days, and, by contrast, pictures of the farmhouse of architectural beauty, the clean, capacious barn and yard and well-bred cattle, William R. Lighton writes entertainingly in a recent issue of the Saturday Evening Post, in answer to the question "What's an Acre Worth?" The article is a plain statement of a well-considered subject the opinions of which are strongly reinforced by observation and verified in many sections of the great West by experience that has trailed slowly along the path of agricultural development.

"Until the generation in which we now live the farmer has never known what he was doing or why he did it," says this writer. This statement is true, except in the most literal sense. The farmer who plowed his land knew that he was plowing; casting seed upon the newly-turned soil, he knew that he was sowing. Of the result of the process there was not the slightest degree of certainty. Weather permitting and blight failing to appear, he hoped and even expected to harvest a fairly good crop—i. e., a crop that would yield food for his family, seed for the next planting and sufficient surplus to pay the tax upon the land, or, if a mortgage covered it, interest upon the mortgage. He was always looking and hoping for the exceptional year of over-average abundance that would enable him to reduce the amount or mayhap lift the mortgage; yet he brought nothing more substantial than hope and expectation, supplemented by tireless, delving industry toward this end.

In the great abounding West, where the soil was more generous than that of New Englnad, though the climate was not less vigorous, and on to the Pacific Northwest, where both soil and climate favored abundant harvests, the story was repeated—the story of not knowing how to make the earth give of her store in return for favors bestowed in cultivating.

This represents an era that, though not entirely of the past, is rapidly passing. "The old order changeth," and, says Mr. Lighton, "the change is sweeping the farms with a swiftness nothing short of miraculous. In all the human story there is no more bitter, utter tragedy than the age-long groping and fumbling of the farmer for understanding—the man who was feeding the world in the sweat of his overburdened body. Our century can show no greater glory than the awakening of intelligence in relation to the work of the farm. It's the biggest thing that ever happened."

And it is happening, working out all around us. At first and for some years the farmer resented hotly or scornfully the suggestion that he needed to be taught how to farm his lands to the best advantage. More often than not it was the farmer-legislator who opposed an appropriation of money for agricultural schools; now it is the farmer-legislator who urges this appropriation, and the lawyer or mechanic or tradesman who sits across the aisle from him cordially joins in the proposal and the appropriation is voted, practically without opposition. Besides, continues Mr. Lighton, there are the farmers' institutes. Once these were meetings of men who came to talk politics and swap grouches; now they are schools of instruction led by the best of the university faculty members and attended by as eager a lot of students—graybeards and younglings alike—as ever gathered at the call of a new idea.

Behind all this and much more, and instigating all and suggesting much more, is the Federal Department of Agriculture. Since the farmer's interests have been represented in the Cabinet agriculture has come to be recognized as a science, the gradual unfoldment of which is a thing of study and of years. Experiment and intelligence have joined hands in its development, and a grand beginning has been made, which, pushed to its logical sequence, will make the farmer's vocation in reality what it has long been in theory, the synonym of independence and plenty.

While many farmers— a majority, perhaps—still pursue the full routine of haphazard farming, with results that correspond—not with the effort made, but without the knowledge that should direct the effort—the new farmer, with his well-digested knowledge of crop-breeding and soil chemistry and his training in applied economics, has raised farming to the rank of a scientific profession. "He is obeyed by the forces that held his father captive."—Portland Oregonian.

TREATING WHEAT FOR SMUT.

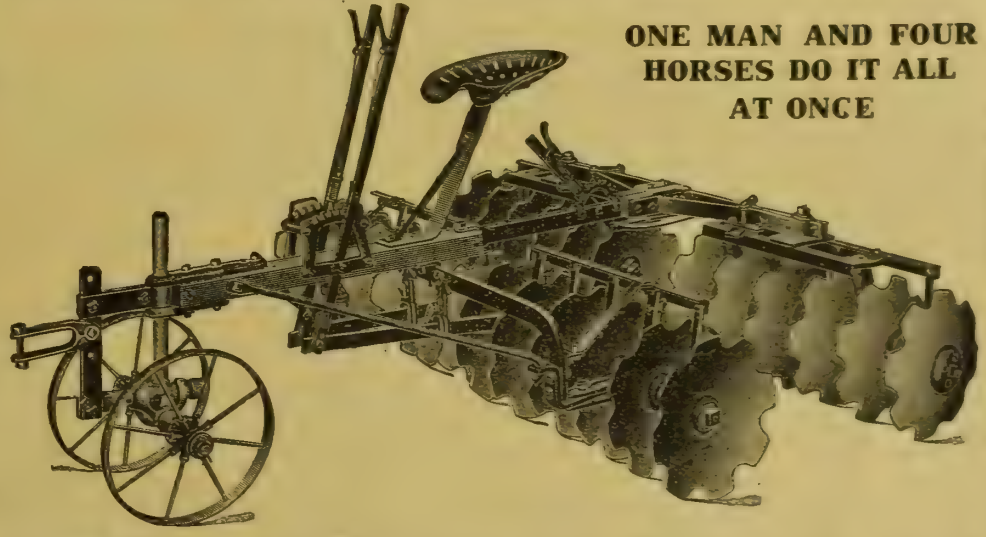
At threshing time this summer a great deal of the wheat in certain parts of the Territory was noticed to be affected by smut, which caused a considerable amount of financial loss to the farmers. Much of this might have been avoided, and may in the future be prevented, by treating the seed before planting, as the disease is caused by spores carried over from year to year on the seed.

There are two distinct kinds of smut that affect this crop; loose smut, and stinking smut. It is the latter that is giving the trouble, and it is this one that is so easily treated. The treatments advised are many, but two methods have been found most satisfactory from the standpoint of economy, ease of treatment and effect.

Formalin treatment. This is perhaps the easiest of all the treatments, and repeated experiments have proven its efficiency. Sixteen ounces of 40 per cent formalin is used in 40 gallons of water and the grain is allowed to soak in the solution for about 30 minutes, after which it is removed and allowed to dry thoroughly. Care must be taken to insure thorough drying to prevent mould. A good way to manage the soaking is to place the grain in coarse sacks of a small size and immerse it in the solution. Many, however, prefer the sprinkling method, which consists of making up the solution in the same strength, and sprinkling it over the seed, which have been previously spread out in some convenient place. About a gallon should be used to the bushel of grain and great care should be exercised in order that no seed escape the treatment. When thoroughly sprinkled they should be covered in the pile with old sacks or canvas, and left until the next day, when they should be uncovered and thoroughly dried. Seed thus treated may be kept many months before planting.

Where infection is bad and the smut is giving a great deal of trouble all sacks, drills, and everything with which the seed comes in contact, should be treated with the same solution.—J. H. Squires, Agronomist, New Mexico Col. Ag.

ARNOTT DOUBLE DISC HARROW
A Plow—A Disc—A Pulverizer—A Smoothing Harrow all in one
The SENSATION of the Day
Compare it Point for Point With Any Disc Harrow Made
Double Gangs
Double Cut
Double Throw
Double Levers
ONE MAN AND FOUR HORSES DO IT ALL AT ONCE



The flexibility of the **Arnott "Double-Cut"** in contrast with the stiff action of other two-way harrows is what is making it so popular. This flexibility is possible because of our Universal Joint connecting the front and rear gangs. For lack of this feature other double harrows have a good deal of side draft and will not make a square turn without digging a great hole. This can't happen on the **Arnott.** Independent front and rear levers within easy reach of rider.
Complete description mailed upon application. Write for prices
ARNOTT & COMPANY, Inc., Southwestern Gen. Agts.
112-118 South Los Angeles Street, LOS ANGELES.
All sizes in stock for immediate shipment, 4 to 10 ft. cut inclusive.

Business Notes

1911 PRICE LIST.

The Fresno Nursery Co., of which F. H. Wilson is proprietor, has just issued its twenty-first annual price list. It gives quotations for this season on practically all deciduous and citrus fruit trees and a large line of ornamental trees and shrubs. Of course, as usual, this nursery is making a specialty of rooted grape cuttings, both on their own roots and resistants These vines are guaranteed to be entirely free from disease and healthy in every particular. The list may be had by writing Chas. A. Chambers, Sec'y, Fresno.

WRONG ADDRESS.

An error in the address of Jas. R. H. Wagner and H. S. Cook of 329 South Hill St., Los Angeles, on page 515 of the issue of November 24th has caused much annoyance and possibly loss to some readers who were seeking the information offered by Messrs. Wagner & Cook. Instead of 329 South Hill St., which is the correct number, it was made to read 239 South Hill St. Any inquirer who has written enclosing coupon in that advertisement and has not received the information will do well to drop a post card to Jas. R. H. Wagner and H. S. Cook, 329 South Hill St., Los Angeles, Cal.

LANGDON'S TOMATOES

"I have tried all the various strains of Earliana on the market, and yours is the only one I have found that meets my idea of what a good early Tomato should be."—Prof. W. F. Massey.

By seven years' selection we have produced the **Earliest, Hardest,** and **Smoothest** Tomato ever grown. Our location near the Canadian line tends to breed in earliness and vigor, for we have no blight. All our seed is home-grown, is extra large and plump, starting strong, vigorous plants. Send for our circular and get more inside facts.

If you want to be first on your market with perfect Tomatoes that will bring a premium over top-notch prices, plant **Langdon's Northern Adirondack Strain of Earliana Tomatoes.**

Price: ½ oz. 40c; 1 oz. 60c; 2 oz. $1.25; 4 oz. $2.00; 8 oz. $3.50; 1 lb. $6.00. A limited quantity of fancy seed from **Selected Crown** settings, ½ oz. 75c; 1 oz. $1.25, postpaid.

F. & H. P. Langdon, Maple Ridge Farm,
Constable, N. Y.

Household Department

I WILL.

I will start anew this morning with
a higher, fairer creed;
I will cease to stand complaining of
my ruthless neighbor's greed;
I will cease to sit repining when my
duty's call is clear;
I will waste no moment whining and
my heart shall know no fear.

I will look sometimes about me for
the things that merit praise;
I will search for hidden beauties that
elude the grumbler's gaze;
I will try and find contentment in
the paths that I must tread,
I will cease to have resentment when
another moves ahead.

I will not be swayed with envy when
my rival's strength is shown;
I will not deny his merit, but I'll
strive to prove my own;
I will try to see the beauty spread
before me, rain or shine—
I will cease to preach your duty and
be more concerned with mine.
—S. E. Kiser.

A DETERMINED ADORER.

The young of all domestic animals are susceptible to human kindness, and respond to it, each according to his kind; some with winning grace, as the pet bird which greets you with a whispered "Sweet! sweet! sweet!" its wings trailing and its little body quivering with ecstasy; or as the pet kitten, which squeezes your caressing hand to its breast with its small furry arms, while its half shut eyes seek yours, brimful of the mysterious love of the brute towards man; not to mention the well-nigh human expression of his heart's adoration given by the noblest of them all, the dog. But how are we to characterize with due respect an exhibition of poor piggie's tenderness? His affection may be as deep as theirs yet who can prize assurances given with a moist snout printing impressions of itself all over your polished boots, to the music of ventral "grumphs?"

Also we humans have set up arbitrary fashions in animal companionship which the animals themselves often rebel against; thus the dog may follow us in public and no one smile, but not the cat; and as for a pig—oh, fie! Be it pink and small as a candy toy, be it playful as Puck, tender "as a baby's sigh"—never in the world!

And yet the best of men cultivated the friendship of a pig—with results, I admit.

He was a country parson, and had enough ground attached to his parsonage to support a horse and cow, not to mention the smaller animals which thrive on farm produce.

They all knew him, down to the little pig, whose home was in a parson-built sty (from which he was always escaping), and vied with each other in claiming his attention; for, parson-like, he was unaffectedly fond of the lower creation.

One Sunday morning an unusually large congregation assembled in the pretty white church just across the road from the parsonage grounds; it was the twenty-fifth anniversary of his pastorate among them, and the ladies had presented him in honor of the occasion with a handsome new silk pulpit gown which he was expected to wear.

The service was over; the parson had shaken hands with some scores of kind souls who wished to show their affection—and well he deserved it—and had started down the road towards his own gate some fifty feet away, when up scrambled Piggie from the shadow of a rock some distance on the other side of the gate, and trotted to meet his beloved master.

The parson foresaw a fiasco, and quickened his stride, his silken gown flowing around his stately figure (for there was no vestry to disrobe in), if he could reach the gate first he thought he could shut it between him and his too pushing adorer, and "the incident would be closed," in diplomatic language.

But the longer his strides grew the faster piggie plied his trotters, while his gentle squeaks of pleasure rose to excited squeals; the parson sprinted; his gown billowing gloriously out behind him, and piggie galloped.

The people stared at the mismatched pair in stricken amaze.

The parson reached the goal first and tried to slip through the gate and slam it in piggie's face, but piggie's blood was up; he charged, head down, sent the gate crashing wide, and shot through like a catapult.

Ill luck directed his course between the reverend gentleman's legs, while the shock struck them from under him, and set him down astride his assaulter; and with porcine shrieks of fright the burdened beast tore up the driveway, while his rider, face to the rear, struggled desperately to free himself from the entangling swathes of silk which bound him to his undesired mount.

Such a roar of laughter as followed them! There was not a soul there who did not revere their pastor above all men, and for worlds they would not have wounded him; but the sight was really too funny, and for a minute they laughed till they cried. Only for a minute, though, then some one hoped he would not be hurt, and the joke was no longer laughable.

A couple of the best runners started in pursuit, and overtook the pair near the house, separated by this time, and stationary. The parson, stripped of his gown, which was carefully folded up and laid on the grass, was gently prodding up and down piggie's backbone, while that worthy "grumphed" complacently.

"I think he's not harmed, he doesn't wince at all," said the parson in a tone of relief. "But I'm sorry about the gown, I don't know how I can face the ladies who were so good," and he ruefully displayed several long slits in the ecclesiastical vestment which effectually ended its career. "Am I hurt? No, no, not in the least, thank you; though the rascal did knock the breath out of me." And he laughed as heartily as his people had done as he realized the figure he must have cut.

Wounded vanity was as impossible to the good man as anger at a brute, however provoking it had been; and the only punishment inflicted on piggie was the securing of his pen so that he could no longer supply "a little diversion after the service," and a noble trough of warm swill to sweeten his captivity.—Green's Fruit Grower.

Do Your Banking
By Mail
Your Money
Will Earn
Four Per Cent
Four per cent per annum is paid on sums deposited with this bank for a period of six months. Interest is payable semi-annually, and if not withdrawn is added to the principal, thus creating a constantly increasing sum, which continues to draw interest at 4%.
Write for particulars of our "Banking by Mail" plan.
Los Angeles Trust and Savings Bank
Sixth and Main Streets Los Angeles

"See the shadow the book throws across my waist? It's like the shadow caused by the metal burner or tank of your light—with this difference, I can take away the book and get direct, shadowless light. See the point?"
MORE LIGHT
—where more light is needed—that's what The Angle Lamp gives. It is oil lighting at its best with the smoke, odor and bother eliminated by new methods. It throws upon book or table a direct shadowless light delightful to read or work by.
THE ANGLE LAMP
resembles a handsome gas chandelier in its appearance and in its convenience. It is lighted and extinguished like gas. May be turned up full or turned low without odor. Safely filled while burning. Requires filling once or twice a week. Floods every corner of the room with a splendid light. Costs about 3 cents per week.
Made in 32 varieties, a style to suit every need and taste.
Call or write for catalog.
Boesch Lamp Co. 1135 Mission St. San Francisco.

THE FARMER'S WIFE.

"Above all, the conditions of farm life must always be shaped with a view to the welfare of the farmer's wife and the farm laborer's wife. To have the woman a mere drudge is at least as bad as to have the man a mere drudge. It is every whit as important to introduce new machines to economize her labor within the house as it is to introduce machinery to increase the effectiveness of his labor outside the house.

"I haven't the slightest sympathy with any movement which looks to excusing men and women for the nonperformance of duty and fixes attention only on rights and not on duties. The woman who shirks her duty as housewife, as mother, is a contemptible creature; just as the corresponding man is a contemptible creature.

"But the welfare of the woman is even more important than the welfare of the man; for the mother is the real Atlas, who bears aloft in her strong and tender arms the destiny of the world. She deserves honor and consideration such as no man should receive. She forfeits all claim to this honor and consideration if she shirks her duties. But the average American woman does not shirk them; and it is a matter of the highest obligation for us to see that they are performed under conditions which make for her welfare and happiness and for the welfare and happiness of the children she brings into the world.—Theodore Roosevelt's Address to Farmers at Utica.

BLEACHING MUSLIN.

Place a boilerful of deeply blued water on the stove and unroll the muslin; put it into the boiler and let it come to a steady boil; boil five minutes, lifting and stirring, then remove from the boiler and, without wringing, hang on the line to drip dry in full sunlight. When dry, iron, and depend on the first washing to make it a clear white.

Another: Into eight quarts of warm water put one pound of chloride of lime; stir this with a stick until all is dissolved. Add to this five pailfuls of warm water; stir it well then put in the muslin. This quantity will bleach about twenty-five yards of muslin. Let it remain one hour in the lime water, turning it over occasionally, so that every part will be thoroughly wet. When taken out, wash through two waters to remove the lime, and hang on the line to dry.

TO REMOVE GASOLINE MARKS.

To take out the marks sometimes left after cleaning with gasoline lay over the place a piece of clean white blotting paper and press with a hot iron.

CORRECT.

During a recent examination in the theology of the Old Testament, the following question was asked a young clergyman: "What language did Balaam's ass speak?" After a moment of thought, a smile flashed across his face and he wrote his answer. I looked at the paper. He had written: "Assyrian."

PROOF.

We know that an act of charity is good because so many men brag about it when they've done one.—Detroit Free Press.

If you have an old hammock that is worn out, cut out the ragged body and use instead a double length of denim, or clean meal sacking. Stitch this to the hammock ends which are good, though the body is worn out, and you will have a hammock that will delight the children.

You lent a hand to a fallen one,
A lift in kindness given;
It saved a soul when help was none
And won a heart for heaven;
And so for the help you proffered there.
You'll reap a joy some time—somewhere.
—D. G. Bickers.

One of the best methods of ridding the house of flies is to put into an atomizer some oil of lavender slightly diluted with hot water. Spray it into the air and the flies will leave the place. This also leaves a delightfully fresh violet odor in the house.

Time is
Too Slow for those who Wait,
Too Swift for those who Fear,
Too Long for those who Grieve,
Too Short for those who Rejoice;
But for those who Love
Time is Eternity.
—Written for a Sun-dial by Henry Van Dyke.

When using celery, save the white leaves at the tips of stalks, dry thoroughly and keep in covered tin boxes. They are a delicious addition to soups, etc., giving the celery flavor when that vegetable is out of season.

You gave on the way a pleasant smile
And thought no more about it;
It cheered a life that was sad the while
That might have been wrecked without it;
And so for the smile and its fruitage fair
You'll reap a crown some time somewhere.
—D. B. Bickers.

A large laundry-bag made plainly of brown linen, or some other washable goods, ought to have a place in every closet, to receive shirtwaists or other soiled articles, as to allow them to lie on the closet floor or about the room, is decidedly untidy and a bad habit.

Keep me from caring more for books than for folks, for art than for life. Steady me to do my full stint of work as well as I can; and when that is done, stop me, pay what wages Thou wilt, and help me to say from a quiet heart, a grateful Amen.—Van Dyke.

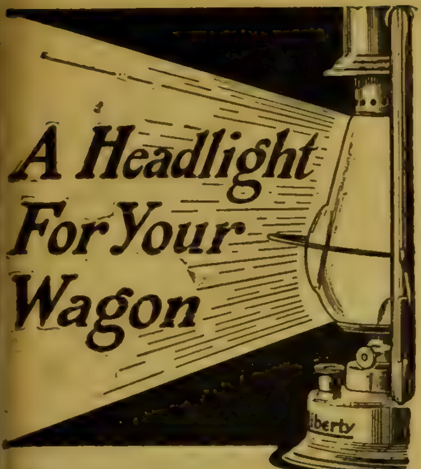
The man who will take the same interest in your business as his own is rare, even though you pay him good money for his trouble.

Be strong!
We are not here to play, to dream, to drift,
We have hard work to do, and loads to lift.
Shun not the struggle; face it. 'Tis God's gift.
—Maltbie D. Babcock.

Those who think this the best age of all ages to live in should not object to an increased cost for the privilege of living in it.

For I am one who lives to say
My skies have held more gold than gray
And that the glory of the real
By far outshines my youth's ideal.
—Ella Wheeler Wilcox.

First, buy good stuff, then take good care of it, and it will be good for a good long time.



A Headlight For Your Wagon
Liberty

Here is a night-driver's dash lamp which is a good second to the acetylene light of an automobile—the Liberty Cold Blast Dash Lamp.

Liberty Lanterns 80c to $3.50

give a strong, steady light. They are oil-tight and wind-proof. The bail stays in any position. The burner gives perfect combustion, and the wick *can't* jar down.

Filled, lighted and regulated without removing globe. Better made and more convenient than other lanterns.

"The Recollection of Quality Remains Long After the Price Is Forgotten."

GOOD CLEANERS.

An excellent way to clean any brass article without injuring the polish is to dampen a cloth with ammonia, rub it over a piece of pumice soap, and then over the brass and polish with a soft, dry cloth.

The common Irish potato is valuable as a cleaner. Mud stains on woolen goods can often be removed by rubbing with a piece of raw potato and woolen goods that are not very soiled can be cleaned perfectly by washing through warm water in which some raw chopped potatoes have been soaked and a little ammonia should be added to the water for black or navy blue cottons.

There is nothing better for cleaning glass bottles than the potato cut in small pieces and put in the bottle with plenty of hot suds and allowed to stand over night; then a vigorous shaking and rinsing out will leave the bottle clean and bright.

There is nothing better for dry cleaning felt hats, jackets and all kinds of woolen goods than cornmeal wet with gasoline. If a woolen garment is soiled enough to be washed, there is nothing better for cleaning it than strong soap suds made by stirring enough pearline in warm, soft water to make a nice lather and this suds is good for delicate fabrics as well as heavy fabrics, such as men's pants and coats, and if the washing is carefully done and the rinsing thorough the goods will be clean and the colors brightened, and this suds is especially good for flannels worn by young children.

It is well to keep on hand a bottle of wood alcohol in which a little salt is dissolved, as this is excellent for removing grease spots from woolen garments, and the alcohol without the salt is fine for cleaning black silk. The best way to use it is to dip a small brush in the fluid and clean every inch of the fabric and then press on the wrong side with moderately hot irons, and no garment will look well unless it is carefully pressed.

To cleanse ribbons, wash them in suds of pure soap and water and dry. Lay them on a table or other smooth surface and smooth down with a wet sponge. They will stick to the table and when dry may be peeled off almost as smooth and fresh as new.

For removing spots from men's clothing, a small roll of rather heavy dark cloth tied or sewed together as tightly as possible will be found a great convenience. Dip one end into the preparation for cleaning, brush the garment gently with it and dry with the other end. This will be found better than a sponge or light cloth, as there will be no lint or bits as from a sponge.—Kansas Farmer.

GOOD WILL AND THE CHRISTMAS PRESENT.

A great deal of criticism is yearly poured out about the Christmas present. Some of it is deserved. The Christmas present that is a soulless exchange between reluctant acquaintances; the Christmas present that is the largest amount of worthless show for the smallest amount of value; the Christmas present that is beyond the giver's means or felt as an obligation by the receiver; the Christmas present that was somebody else's last year and is saved up and passed on; the Christmas present, in other words, that is machinery and pretence and not the living, real thing—this ought to be criticised out of existence. But the real Christmas present is a different thing, whose critics judge themselves.

The real Christmas present is a concrete bit of good-will and affection. The baby's first Christmas stocking—what family could argue calmly about doing away with it? The children's gift to mother, selected in conclave, and saved for enthusiastically—how much it means. The remembrances of friends, be they intimates of next door or divided by half the earth—what a fulness they give to the world-wide day! It is because of the sweetness of the Christmas gift that foolish people abuse it. They try to grasp too much, or to fill the empty place of the real gift with the simulacrum of it. Let each Christmas present be real—let that rule be held to—and all the joy is kept, and all the mistaken rush and overloading and nervous strain vanish. For real gifts are full of simplicity and love, and the spirit of Christmas is peace—peace and good-will.—Harper's Bazaar.

THE COUNTRY'S CHRISTMAS GIFTS.

There are some gifts this country needs, and that woman can put in its Christmas stocking. If she does not, America will go without them, day by day, throughout year after year, and suffer for the lack. One is the gift of pure food, in every home—pure food which never will be reached until the women of the United States insist upon its manufacture, its presence on the grocery shelves, its safeguarding by adequate law.

Another gift needed is that of the right of every American child to live, to be educated until its fourteenth year, to be protected against the forces of greed and of evil. Christianity means this or it means nothing; and yet babies all over the land die by the thousand, poisoned by stale milk or murdered by tenement conditions; and little children toil, dwarfed and exploited, in American mills and mines and sweatshops. Not until every woman helps to give every child its life and its rights in our land has she come into the true national spirit of Christmas.

A third is the gift of health. It rests with the women to create the home, the school, the municipal conditions of wholesome living in each community. Pure air in every room, clean surroundings, sanitary laws—these are no mystery beyond any woman's learning, or beyond the power of women's concerted action to gain inside and outside their homes. All men agree, all doctors repeat, that woman alone can confer this gift of public health in all its details and its fulness.

There are others. But just these three—if 1910 saw them given, what a Christmas Uncle Sam would have, and how he would rise up and call the givers blessed!—Harper's Bazaar.

FLOWERS.

A widow's "weeds" are flowers that tell
Her sad bereavement story,
But often they're so pretty that
We call them "mourning glory."
—Cleveland Leader.

ME, TOO.

"Don't move," she cried; "I've got a bite."
The man said with a sigh,
And poked his fishpole down his back;
"Confound it, so have I."

"Grant my request, dear Lord, I pray,
That every mistake I make today
May serve, like an angel's touch, to show
How on the morrow I ought to go."

Hay.

Scott, Magner & Miller say:

Arrivals of hay for the week have only been about 1500 tons, which is a remarkably small amount for us to receive compared to the large amounts that have been coming in here steadily for some time back.

There does not appear to be any life to the business lately. Consumers have been expecting to buy their hay at summer prices, and as the holders of hay in the country have been asking higher prices than in the summer time, trade has been retarded, and it has been difficult to handle anything here with any satisfaction.

Fancy hay commands our top quotations, but there has been so little of this kind offered recently in this market that the prices for such hay have cut no figure in the general market. The medium grades of hay are dull, and slow to move, and a thorough quietness pervades the entire market, and anything that may develop that can change this unsatisfactory condition will be very much welcomed by all parties concerned.

The shipping trade has continued quiet. There has been some inquiry from the Puget Sound district for grain hay, and it was thought that we could obtain an outlet in that section for considerable hay in competition with the Canadian product, but apparently our present prices will not permit of our entering their markets at this time.

Deciduous Market

SACRAMENTO, Dec. 3, 1910.

The following circular of the California Fruit Distributors gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, December 2nd, 1910:

Grapes: 15 cars.

There were no shipments made on the 29th of November and on the 1st and 2nd of December. It is likely that there will be no further shipments and we may consider that the season is now closed. As there is considerable interest in the shipments made from California for the season the following is appended showing the number of cars of each variety leaving the state in 1910:

Cherries, 250 cars; apricots, 290 cars; peaches, 2518 cars; plums, 1552 cars; pears, 2361 cars; grapes, 4930 cars; apples, 2104 cars; miscellaneous, 17 cars. Total 14,022 cars.

Citrus Market

LOS ANGELES, Dec. 7, 1910.

Navels are proving sweeter and rather better colored than last year this date. This is resulting in keener demand and while no record prices are made yet, the average is excellent. Were it not for the rain which has stopped all work in both Butte and Tulare counties those sections would be practically cleaned up.

With favorable weather conditions the present promise of one of the finest quality crops ever will be made good. Sizes are running excellent.

Lemons are rather slow and the present cut is now going into storage for spring delivery. The quality is superb and with frost protection in most orchards the quality cut will continue till spring.

Shipments.

Shipments of oranges since November 1, 1910, 733 cars; lemons, 499 cars; total, 1,232 cars. To same date last season: Oranges, 285 cars; lemons, 303 cars; total, 588 cars.

NEW YORK, Friday, Dec. 2.—Four cars Navels, 1 car Valencia and 2 cars lemons sold. Prices lower on oranges, easier on lemons. Weather fair, cold.

BUSINESS FAILURES.

Commercial statistics indicate that business is a great hazard. Failure is inevitable for the average business man whether he is engaged commercially or in manufacturing.

Bankruptcy, said a director of the Union Bank of Boston, is like death and almost as certain.

The cause of the whole trouble is due to the unsound and unwise principles which prevail, the anarchy which reigns over our business affairs, suicidal competition, ruinous prices, dishonesty, the manufacture of "cheap and nasty" goods, etc.

But there are exceptions to the almost inevitable rule of failure. One of these exceptions, a remarkable one, is The Temple Pump Co., of Chicago, Ill. They are now entering their 59th year of continuous manufacturing. They manufacture Gasoline Engines, Windmills, Pumps, Tanks, etc. Fifty-nine years of continuance can be no other than the outcome of reliability in their output and conscience in their dealing with their customers.

SPECIALIZING.

Mr. J. B. Wagner of Pasadena, who is well known to Cultivator readers as a breeder and producer of plants, especially of improved strains of Crimson Winter Rhubarb, has also propagated and dealt largely in fruit trees and ornamental plants. He has now disposed of his general nursery stock to D. W. Coolidge, nurseryman, also of Pasadena. This will enable Mr. Wagner to devote his entire time to the propagation and improvement of rhubarb, berries and small fruits. In addition, he will give much time to developing the giant black walnut timber tree. Photographs of this walnut have been shown in the Cultivator, exhibiting a wonderful growth. Mr. Wagner is strong in the belief that it has a great future. Spineless cactus, asparagus and horseradish will also receive some of Mr. Wagner's attention. Mr. Wagner is issuing three booklets, one on rhubarb, one on berries, and another devoted especially to his black walnut, which make interesting reading. They will be forwarded on request. Mr. Wagner's address is Pasadena.

INTENSIVE FARMING.

In a seed store in Topeka some time ago, I saw a man call for some alfalfa seed. The dealer told him that his best alfalfa seed was worth so much per bushel. The buyer objected to the price and asked if he had not a cheaper seed on hand. He was told that he had but would not give it the same recommendation. The inferior seed was bought and sowed, and when the crop came the difference was shown. Not only had it required more seed to cover the land and secure a stand which made the first cost fully as high as it would have been with the high priced seed, but he found that he had also sowed a number of different weeds and other plants which he did not want in his alfalfa. He is now convinced that the high priced seed would have been a great deal cheaper for him to buy.

Intensive farming not only includes the selection of good seed, but it includes the proper handling and cultivation of the soil as well. Good seed is of itself an important item in successful farming, but this must be backed by good soil preparation and good cultivation. Another important point is to be found in connection with the raising of live stock. In the last year or so, within several states of the corn belt, there has been a wide-spread tendency to quit live stock farming, because the high prices of feed have made grain farming more profitable for a brief period. This has proved to be a mistake as no successful system of continuous agriculture has yet been devised which does not include live stock as an important factor. Intelligent live stock farming is and always has been more profitable than grain farming. It not only brings greater immediate results, but it is vitally important in the conservation of the resources of the farm. Exclusive grain farming is not likely to be generally adopted as a permanent thing until we can ourselves eat corn and hay. Every crop that is of value, as well as every weed crop that is developed on the farm takes from the soil a certain amount of food elements which must be returned or which will leave the farm poorer than it was before. The grain farmer sells his farm with each load of grain that he markets. The live stock farmer retains the original capital in his farm and each year turns off a profit in the way of crops. The well conducted stock farm maintains its quality or increases in value as the years go by.

Intensive farming is not a bug-bear. It is not something big that we should strive after without very definite ideas of attainment. It is simply common sense applied to our everyday work. Use the best seed. the best methods of preparation and cultivation of the ground, breed and feed good live stock, and turn every ounce of manure back to the land, and we shall have solved the question of intensive rather than extensive farming.—Kansas Farmer.

ILLUSTRATED PRICE CATALOGUE.

Many of our subscribers have seen "California Horticulture or The Fruit Grower's Guide," issued by the Fancher Creek Nurseries. This is a large, fully illustrated and beautiful book of 120 pages and is mailed by the Fancher Creek Nurseries, of which George C. Roeding is proprietor, for 25 cents. But for those who may wish a more concise guide of the productions of the nurseries, Mr. Roeding sends out annually his price list. which this year reaches the dignity of "An Illustrated Price List." It is full of illustrations and concise descriptions with prices of all plants and trees handled by the nursery. Fruit trees, vines. and ornamentals are fully described. It is well worth the asking, and to the prospective purchaser of nursery stock we doubt not it will be sent.

The Luitwieler Non-Pulsating Pumping System

Deep Well Pump Talk Continued :

Cut showing the Luitwieler heart-shaped cam and the only reciprocating pumping mechanism applying the power uniformly throughout the full stroke and uniform speed of the water pistons in both directions. The cam principle is universally conceded to be the most perfect mechanism for lifting water from deep wells or against pressure. Luitwieler pumps are the result of 33 years experience and embody the perfection of the cam principle.

The mechanism is balanced, and our pumps are tested for smoothness of operation, to be run being driven by only a ⅜-inch belt lace, a test impossible with any other reciprocating pump. Luitwieler pumps are in a class by themselves, with fewest working parts and giving most perfect results.

The leading shipping and table sorts are in strong demand. Also raisin grapes, Muscat, Sultana and Thompson Seedless. We list only the best and quote at reasonable prices.

BURBANKS NEW CREATIONS

The Standard Prune

Are you aware that this new prune which is, without exception, the finest fruit of its kind ever introduced, is being offered by us for the first time this season? We can endorse it highly as an enormous and never-failing bearer, strong, healthy grower and best combination drying and shipping prune ever offered. The fruits average very large in size, are very sweet and perfect freestones.

The Formosa Plum

Far exceeds all other Japanese plums in its rare qualities as a shipping fruit. A grand fruit of largest size, heart-shaped and light cherry-red in color. The trees are very magnificent upright growers and abundant producers. This variety will appeal to every shipper of high grade fancy fruits, and we would urge you to include it in your collection.

WE ARE FORTUNATE IN HAVING A FINE STOCK OF THESE TREES TO OFFER AT ATTRACTIVE PRICES.

Annual State Fruit Growers Convention at Stockton

The Convention Declares for More Liberal Appropriation for State Commission of Horticulture.—Standardization Encouraged.—Warning Against Mediterranean Fruit Fly.—Legislation urged which will give More Quarantine Powers

"It's a burning shame that the horticultural interests of California, practically a $150,000,000 industry, should be sidetracked with a measly appropriation of $12,500 while the state game and fish commission, which has to do with preservation of sport, has its great fund which requires six figures to express. The importance of the industry is such that we should all work for a greater appropriation by our legislature."

The above is the substance of a remark by Geo. C. Roeding of Fresno at the State Fruit Growers' convention at Stockton last week. He was indignant, even "hot" and that is "different," for Roeding seldom loses his temper. But it really was interesting for the madder he gets the better natured he looks. His remarks counted, however, for the hearty applause showed that the convention was with him in the demand that the greatest industry of California should receive more recognition at the hands of the coming legislature.

As Mr. Roeding said this work of the Fish and Game commission is worthy, for many find sport and recreation through the protection and increase of game and fish. But to place a sum almost fabulous in the hands of that commission while the horticultural interests which are vital to our welfare, receive a few thousand, is not the greatest manifestation of wisdom.

Geo. Compere read a paper on the subject of fruit flies and the warning which he gave as to the menace of the Mediterranean fly which is now in Hawaii was made plain to the delegates. The principal danger at present lies in the fruit that passengers from Hawaii may bring into ports of California without examination of baggage. Naturally such passengers will bring much fruit and unless they voluntarily give it up to inspectors of the horticultural commission they may carry to any fruit growing section of the state infected fruit which may release the most dreaded and absolutely uncontrollable pest known to fruit growers of the world. The enlargement of the powers of the commission and the granting of an appropriation which will enable it to enforce proper regulations are factors with which the coming legislature will have to deal.

Standardization.

The above was only a side issue in the Thirty-eighth Convention of State Fruit Growers. The greatest interest and much of the time of the convention was absorbed by standardization—grading or "honestization"—of the California fruit pack. One entire day was given over to its discussion. Green fruit only was touched upon. The work in Placer, El Dorado, San Joaquin, Sacramento, Sonoma, Shasta and Tehama counties was reported and in every case satisfaction expressed of the first season's results. Some growers are refusing to join, also a few shippers, but the more satisfactory returns which the guarantee labels on the standardized fruit brought on the average will doubtless cause more general observation of the practice another year. The Shasta-Tehama Fruit association showed an especially attractive color lithograph label with "Shasta Quality" trade mark, and "Standardized Fruit, grown in Shasta and Tehama counties, California," and of course Old Shasta, snow-clad, in the background.

The Almond Growers.

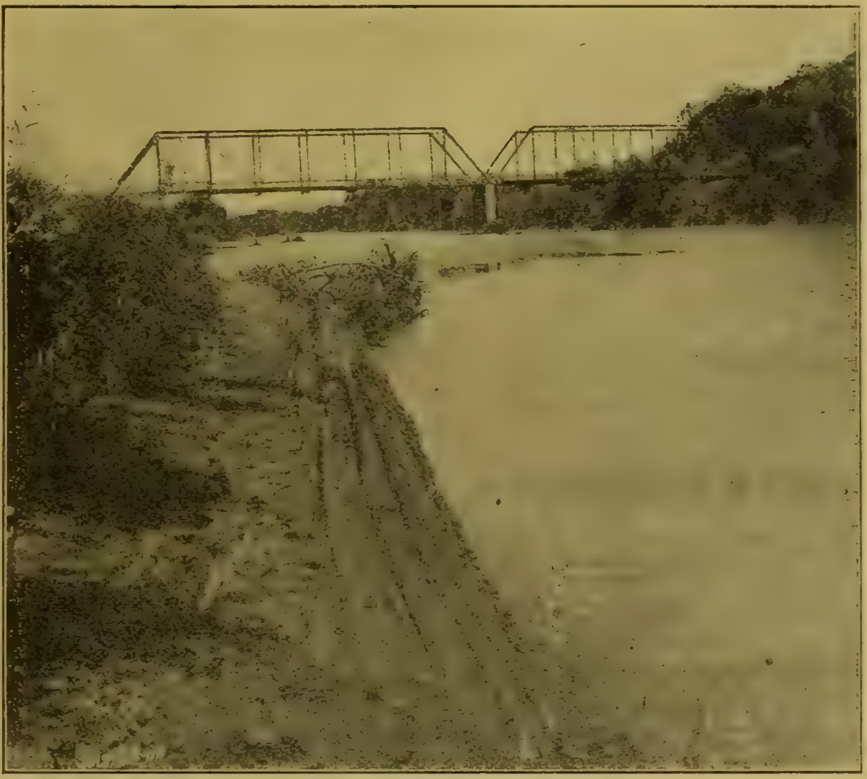
J. P. Dargitz, manager of the California Almond Growers' Exchange reported progress on the part of that organization in its first year. All the stock of the members has not yet been sold, but every promise is that the returns will be satisfactory. The regrettable part of this co-operative movement is that the expense of its support falls on the members while the benefits are almost as great to the outsider who takes advantage of the studying of the market by the co-operators. About 500 tons of nuts are yet to go.

Freight Rates.

Of course, Russ Stephens of Sacramento presented his report; rather the report of the committee on freight rates. This committee consists of R. D. Stephens, Sacramento; M. E. Anjier, Lodi, and C. M. Hartley of Placerville. This committee is the one standing committee of the convention and has been hammering away on freight rates for years. The specific demand is that the dollar postage stamp rate, formerly granted to lemons, shall be granted to green deciduous fruits.

The worst fight ever put up against this committee was at the San Jose convention a few years ago. Employes of the railways appeared at that convention and their efforts, supplemented by the work of many fruit-growers who felt that the committee was too aggressive, nearly got the best of the committee. Stephens is persistent, however, and at the Watsonville convention last year the following resolution was passed:

"Resolved, That the able and exhaustive report of our committee on freight rates shows valuable data and a vast amount of labor performed, and we hereby endorse that portion of their claim for a reduction of a freight rate bringing deciduous fruits on a par with the orange rate. We justify their demand for a postage stamp rate of $1.15 per hundred pounds, but later experiences and computations, with present labor conditions, show us that a rate of $1.15 for the past season would have been too high to encourage any further development in the fruit industry. Therefore, we hereby instruct our committee on freight rates to press the matter through all legitimate channels for a postage stamp rate of $1.00, thus placing all deciduous fruit growers on a par with the lemon and apple growers of the coast. This rate will satisfy the fruit interests and offer encouragement to present and prospective growers."



Courtesy San Joaquin County C. of C.

SCENE ON MOKELUMNE RIVER, S AN JOAQUIN COUNTY.

This year's convention also endorsed the effort of the committee, also took steps to have the matter brought before the Interstate Commerce commission in the hope that that body might force the issue and secure justice from transportation companies. The committee has formerly believed in securing the concession from the railways direct but that hope is now given up entirely,

Annual Address.

The commissioner's address was not long and more largely devoted to Standardization, yet many other points were touched. On the matter of standardizing or putting up a more honest pack Mr. Jeffery said, in part:

"California is under special moral obligations to send an honest and uniform fruit pack. All will admit that it pays to do so, but in our case both moral obligation and self-interest join in the new plan of improving the fruit pack, and I cannot see why, under these circumstances, it should be necessary to agitate a matter so conclusively established. But it is necessary, for out of over three dozen meetings held in deciduous fruit counties only five of these counties adopted standardization.

"As we approach the relationship of standardization to overproduction, I think the subject deserves a side remark upon competition in the fruit business—justified also by purposes of this convention, for we are not here to consider solely the methods whereby we can grow more and better fruits. Cultural matters in horticulture have been given relatively too much attention—relatively, I say, because it follows inevitably that the elimination of dishonest and destructive competition in the production of fruits by raising the standards will do more for better horticulture than all other influences combined. Our subject here 'swallows itself and winks with great agility,' like Barnum's famous snake, for how can we advance standardization and legitimately curtail the output of unfit fruit against the products of ignorant and inefficient horticulture that are flooding the markets and have their origin so largely in the orchards that are planted merely to sell otherwise unsalable land? This is what I mean by unfair competition in the fruit business.

"It is useless to preach, unless one lives up to his pronouncements. And this is just what hundreds of growers are attempting to do in standardizing their fruits. And it is in line with one of the chief policies of the office which I represent. Those progressive growers have not ceased to educate themselves toward the practice of better cultural methods. But they have gone further and have tried to substantially protect the results of bet-

INSPECTION OF NURSERIES

An Address Appealing for More Uniform Horticultural Laws, by George C. Roeding of Fresno. Before the California State Fruit Growers Convention at Stockton Dec. 6.

At a meeting last June of the horticultural commissioners and delegated fruit growers from each county of the state, you were given a new title by Mr. Stabler, who insisted in a discussion which arose at this meeting that you were policemen, minions of the law, so to say.

Yes, in a sense you are policemen doing your duty, enforcing the law, but in connection with your work, can there be any harm in making a claim for you that you are educators as well, not in the sense that you must beg the fruit grower and the nurseryman to comply with the law, but that it is to their interest as well as the state at large, to follow your advice and instructions so that the greatest industry in California,—and in my opinion it always will be—is protected by an organization of men so thoroughly trained, so keen to do good, so well educated not only as practical entomologists and horticulturists, that your firm attitude in enforcing the laws for the protection of our great fruit interests worth fully one hundred and fifty millions a year, will be so much appreciated by the fruit-growers that they will be quick to respond to your suggestions, not because you are policemen, but because you are educators along lines which must find a responsive chord not only in the heart but the pocket strings of every fruit grower.

To the man who will not take care of his property, and who never will unless he is forced to do it, may you always be policemen and determined ones at that, but to the intelligent fruit grower and nurseryman, may you be harbingers of good, showing him by your counsel and advice how it is best to take care of his interests. It is only by unity of action that this great industry of ours is going to be maintained at the standard it deserves. I want to see the time when the animosity which seems to exist between the nurserymen and horticultural commissioners is obliterated so that the two may combine to build up the great fruit interests of this state.

To illustrate how bitter the nurserymen are in many parts of the United States in their denunciation of the horticultural laws, I want to quote from an address of Mr. E. W. Kirkpatrick of McKinney, Texas, made at the American Association of Nurserymen at Denver, Colo., last June.

"Nurserymen, agriculturists and horticulturists are patriotic and loyal to the government; they recognize the fact that they are a part of it, and cheerfully contribute to its maintenance not only in the payment of their money in the form of taxes, etc., but if need be in the sacrifice of their property or their lives. It is our wish to build up and strengthen it and perpetuate it. It is not our purpose to tear down and destroy. All we want is a square deal. It is said that there is a specific germ from which all these insect diseases that have been enumerated spring. Some of the doctors say not, and when doctors disagree what shall the amateur do? In our state, an inspector notified us that our orchard needed inspection, and we invited him to visit us. We have to pay the expenses down there. He came and told us there might be 'crown gall,' or some 'little peach' or 'curl,' and fixed up enough spray to go over about five hundred acres. We applied it, and when we had finished the leaves were dead, the twigs were dead, and the young fruit dropped and our crop was lost. The trees failed to show any buds the next year, and we lost a second crop, and our manager estimated the loss at $10,000. Now the inspector says he does not want to give us unnecessary trouble or cause us loss, but where is our remedy when troubles and losses like this come? How are we going to get that $10,000 from him?

"We do not want to suffer any more, but are anxious that the truth shall be known and prejudice and poor judgment set aside. Some of us are getting along in years, but we want to go on building orchards, and ornamenting the grounds surrounding the homes and avenues of our cities and towns, pleasing the eyes of the people; pleasing them also with the fruit which grows from the trees as well. We want to give them esthetic education, creating an ambition and aspiration within them to build finer homes, dressing them up and making them veritable Edens upon earth. You cannot anchor the boys and girls to the city and country homes more surely than by planting trees and shrubs and inviting round them the birds and the trees and the sweets of earth. Then you will have a happy people, but you cannot have all these if you destroy the nurserymen."

Mr. Kirkpatrick is a Southener of the old school, a man of fine character and a high order of intelligence. He was so forceful, however, so bitter in his denunciation of the evils which the inspectors do the fruit interests, and particularly to the nurserymen that I fear had our California Commissioners been present they would have taken severe issue with him on his scathing remarks.

I am a mild-mannered, good natured sort of fellow and do not expect to arouse your feelings to a pitch such as Mr. Kirkpatrick would do, nevertheless I do not hesitate to say that the nurserymen of California are becoming more and more surrounded by a complication of horticultural laws, so that they are constantly facing propositions which make it very difficult for them to do business beyond the confines of their respective counties. This is not an insinuation that the horticultural commissioners of this state are wilfully trying to injure the nursery business, but, nevertheless, the fact exists that influences are often brought to bear on commissioners, which work serious injury to the nursery interests, and they can be regarded as nothing more than restrictions of trade, with absolutely no equity in law to support them.

I am going to show you by actual facts just what has occurred in several instances:

In December, 1906, I read a paper in Hanford on this very same subject, in which I expressed my views relative to the unfairness to the nurserymen of many of the county ordinances. At that time I quoted from an opinion given by Hon. U. S. Webb, attorney general, which I take the liberty of again repeating, as I think it should be impressed on your minds.

"Your fourth question is as follows: 'If county boards of supervisors have authority to pass a horticultural quarantine law, can they pass a general ordinance declaring any or all nursery stock or grapevines brought into their county from any part of the world a nuisance, without any inspection of the stock?'

"It is my opinion that ordinances so sweeping in their nature as you describe would be held by the courts to be unreasonable and void, as arbitrarily declaring that to be a nuisance which was not in fact a nuisance. To make an occupation indispensable to the health and comfort of civilized man, and the use of the property necessary to carry it on, a nuisance by a mere arbitrary declaration in a county ordinance and suppress it as such, is simply to confiscate the property and deprive its owner of it without due process of law."

I want to say further that the Hon. H. Z. Austin, superior judge of Fresno county, rendered a decision against the supervisors of Fresno county, in which the county was compelled to pay damages because a lot of grape cuttings, which were shipped from Contra Costa county to Fresno county, were destroyed by the horticultural commissioners, although the cuttings were not diseased. They claimed the right to do so under the ordinance which peremptorily prohibited the importation into Fresno county of grape vines or cuttings, north of a certain boundary line established by our supervisors.

A few years later phylloxera was found in Fresno county, and what was the result? Tulare county passed an arbitrary ordinance in the very height of the nursery season, causing me to have several thousand dollars worth of orders for grape vines cancelled, which were ready for delivery. In my paper read at Hanford, I expressed my opinion of the unfairness of this ordinance and had the pleasure of learning later in the day during this session that the supervisors proposed to fight the matter to the bitter end. What was my surprise to learn that within a month a new ordinance had been framed permitting the shipment of grapevines into that county providing the nurseryman gave a bond of $5000 to cover his delinquencies. Did I give the bond? Why, of course. Now our vines are shipped into Tulare county without any restrictions. What was the reason for this sudden change of heart? Not my paper. Oh no! But because a certain nurseryman who was formerly a citizen of Fresno county had changed his residence to Tulare county, and had grapevines growing in Fresno county. They did not want to fight a citizen of their own county so the ordinance was modified.

Stanislaus was the next county to fall in line with its prohibitive law. And what happened? One of the supervisors who voted for this ordinance, came up to Fresno county, purchased two carloads of grapevines and shipped them into his county. What was the reason? None other than the varieties wanted were difficult to obtain and the prices charged in his county for grapevines were unreasonable. The vines were passed without a word of protest. What would have hapened to Roeding had he made this shipment?

Even Kings county had to have its little axe out. What did it do? Made it compulsory for the nurserymen shipping stock into the county, as well as the purchaser, to give a bond of $5000 before stock would be delivered to him.

It is useless to say any more of these restrictions, for it will take up too much of your time. I can not, however, forget Tulare county's latest. It has quarantine stations compelling the shipment of all stock to specific points before the stock can be transported to destination.

Primarily this ordinance was framed for the purpose of protecting the citrus interests of this county. As practically all the citrus trees are shipped in carload lots, it worked no great hardship, but with deciduous shipments it certainly played havoc, for it meant the unpacking of bales and boxes, work which must necessarily be done with much care in the nursery. The tearing apart of these packages, which it was out of the question to put together properly again, has been the cause in many cases of having stock reach destination in bad condition, and the consequent strained relations between the nurserymen and purchasers.

At the meeting in June, in Sacramento, there was a tendency on the part of certain commissioners to adopt this same ordinance in other counties. I beg of you not to do so. Give the nurserymen of California a little respite and do not throttle them any more than you have already done. I want to reiterate that our state law serves every purpose; live up to it and no man in the fruit or nursery business will have reason to complain.

You must all concede that a nurseryman is a benefactor. Who has grown the trees, vines and plants, which have made California's name famous in the horticultural world, if it is not the nurseryman? Who is responsible for the introduction of the best fruits of the Old World, and the introduction in many cases of new varieties of fruits, if it is not the nurseryman Is the average nurseryman not a responsible citizen, trying to make an honest living by producing trees which every fruit grower must have? Then why go on passing restrictions upon restrictions making it more difficult year after year for him to conduct his business?

Who is it that invariably introduces a new pest into a locality? It is not the nurseryman, but usually some amateur fruit grower who with no other object in view than to save a few cents on his purchase of trees, introduces a disease or insect which not only costs the state but the nurseryman as well thousands of dollars, the pest in many cases being of such a nature that eradication even by the most stringent measures, is utterly impossible.

California with her wonderful resources has taken the lead in the horticultural world, and it must be conceded that more has been done to advance our horticultural and viticultural interests along modern commercial lines, not only as compared with every state in the Union, but I believe I am not making a rash statement when I say that she stands supreme over every nation of the world. Her horticultural laws are the basis for the laws of every state and territory engaging in the fruit business and strange as it may seem, it is nevertheless a fact that the states seem to vie with each other in seeing how much more severe, how much more drastic they can make their laws to restrain the nurserymen from doing business.

I am pleased to say that there is hardly a man among the old commissioners in California whom I do not esteem as a friend. I have no great personal grievance; I have been accorded the fairest treatment by these men as far as their ordinances will permit. This fight I am making is one of principle. I don't want to hear the old story that we are not fighting you or any other nurseryman except on your shipments of grapevines. I want to say in reply to you, if an ordinance which so effectively prevents the shipment of grapevines into a county may be so easily enforced, what is to prevent the adoption of measures which will be equally as effective against any other class of stock?

In conclusion, I wish to say that I hope to live to see the time when the stigma which is attached to a man engaged in the nursery business may be removed, and when the nurserymen and horticultural commissioners will join hand in hand in the upbuilding of this great garden spot of ours, by making better, finer, cleaner fruit and maintaining a standard which will make us a world power in every branch of horticulture.

Visalia's Brain, Brawn and Bank Make Tulare County's Big Citrus Fair "Go"

An Epoch-Making Event in the County's History.—Magnificent Locality and Individual Entries.—Fine Pavilion and Decorations.—15,000 People Attend

Nothing Succeeds Like Success.

For the past four consecutive years it has been the pleasure of The California Cultivator to say a good word for the annual Tulare County Citrus Fair, and for a like period it has been the privilege of the editor, in conjunction with R. M. Teague, to act as judge for the citrus division. Allowing for these facts, the writer has gained a perspective of not only the fair itself, but also of the developing atmosphere that is so pronounced a feature of Central California at the present time. With the passing of the years it is gratifying to note the advances that have been so pronounced in citrus culture in the thermal belts of the great San Joaquin Valley, and the annual betterments that have taken place in the fair itself. The one that held sway December 5 to 10 was no exception to the optimistic opinions here expressed; quite to the contrary, it developed such strength and wide public interest throughout the State that it has inspired the horticultural-agricultural interests in the county with the idea of making it as much of a regular annual function as the State Fair at Sacramento or the State Fruit Growers' Convention, with a permanent home at Visalia—the most central point in the county, and hence the pivotal point for exhibition purposes. People from as far north as San Francisco and her environs, and as far south as San Diego were in evidence, and agreeably surprised at the quality and extent of the exhibits. The attendance was large, averaging something like 2500 daily, or about 15,000 for the week. This, when coupled with other sources of revenue, leaves a handsome sum to the good for the fair of 1911.

The Feast for the Eyes.

Obviously, the big attraction from a horticultural point of view was the display of citrus fruits, but in addition thereto were fine exhibits of deciduous fruits in season, garden and field crops, vineyard products, canned, bottled and cured orchard crops, and dairy products. The arrangements were fine—at once satisfying the canons of good taste and meeting the exigencies of comfort and convenience; but the greatest asset of the enterprise was the unity of action and individuality of purpose evinced, not only by the business men of Visalia, but by the entire fruit interests of the county—all elements that stood out for success in the fruition of the enterprise. All who participated were more than satisfied.

The Locality Exhibits.

In spite of the fact that locality exhibits are efforts calculated to impress and draw the attention of the masses rather than that of the experienced grower and expert in fruit culture, the ones here shown were not only artistic efforts, but did "bunch up" some of the finest fruit that the sun ever shone on. But in addition to this, in design, decoration and execution many were strikingly original and possessed of a strong horticultural atmosphere. This is as it should be, and it is certainly a sign of progress to see improvement from year to year in this direction. Fruit displays in design and execution should be redolent of the soil and be suggestive of an artistic temperament. The arts of the factory and the goods of the store should be supplemental, not the first consideration.

The most striking locality exhibit and the winner of first in its class was that of Strathmore, a new citrus colony situated between Lindsay and Porterville. As will be noticed on our first page illustration it consisted of a square, in the center of which was the revolving world announcing on its West Coast the astounding news that between Los Angeles and San Francisco there is but one other town, viz., Strathmore; a josh that made its point by putting the new settlement on the map. At one of the four corners was worked out a Maltese cross, at another a shield, at another an anchor, and at another a horseshoe in oranges and lemons. Interspersed at right angles were pyramids of citrus fruits, and baskets of semi-tropical fruits; at regular intervals were potted ornamental foliaged and flowering plants; the remaining decorations were festooning and greenery. The entire exhibit was overhung with a canopy surrounded by electric lights, the color scheme being in delicate shades of green, orange and white. In design, harmony and decorative effects the exhibit was one of the most perfect ever shown. Strathmore being new, commercial production is not yet possible. The fruit shown was all harvested from trees less than five years of age.

The winner of second place was that of Exeter, showing as its central feature a Ferris wheel in action carrying boxes of citrus and deciduous fruits and colored electric lights. The ground or base of the display was neatly worked out in citrus fruits, showing oranges, lemons, limes, pomelos, etc. Fruit was of good quality, in a number of the individual exhibits winning first.

The winner of third honors lost to second on design and decorative quality—the oranges and lemons shown by Lemon Cove being easily in the first class. Judging only by looks, the judges pronounced it perfect—and the lemons certainly were beauties. Had Lemon Cove thrown more stress on decorative quality, she would have taken second. Even as it was, the exhibit ran high in the individual classes, winning the largest number of awards.

Dinuba came in with a unique exhibit consisting of a center piece representing one of the old-fashioned windmills that are so prominent a feature of the landscape in Holland. This was neatly worked out in oranges, and decorated with bunting and electric lights in the four arms. The base or ground plan showed choice specimens of grapes, olives, oranges, lemons, apples, etc. For originality it was one of the features of the fair.

Visalia's showing was the horn of plenty, picturing nearly every product of the surrounding country from peanuts to tobacco, from sunflowers to Japanese persimmons. Here was shown the celebrated Beta vulgaris Balaami, the biggest beet that ever beat the game, and also the great Cucurbita Subjohnsoni, said to be a member of the Johnson pumpkin roller family, indigenous only to Visalia. The exhibit was a splendid object lesson of the diversity of soil products that is spreading the fame of Tulare county in the four directions of the compass.

Orosi maintained its fine reputation for the production of citrus fruits in a chaste and simple exhibit which possessed harmony of design and color. It was a square pillar effect, painted pure white, with decorations in green and yellow, which blended nicely with the color of the fruit and the ornamental foliaged plants with which it was ornamented. In addition, the Board of Trade of Tulare county had a large exhibit of cured, bottled and canned products in an attractive booth.

Lindsay's exhibit was the most commercial in the room, the fruit exhibited being of uniform size and color and very carefully packed. The boxes were arranged in the form of a huge swastika, and the interstices were filled with displays of other fruits. A sly dig was conveyed to Florida in a display of "sour Florida oranges" side by side with a plate of perfect blood oranges on the border of the exhibit.

Porterville had a great pyramid of carefully selected oranges and lemons, surmounted with a placard bearing the well-known slogan, "Porterville People Prosper." Pomegranates and other fruits were shown, to prove that Porterville has the horticultural versatility of other places.

Three Rivers had a large and beautiful display, one interesting feature being a map in which lines of red Winesap apples traced a reproduction of the north, middle and south forks of the Kaweah river through a plain of well selected oranges. In the background were cleverly arranged groves of little eucalyptus trees flanking the mountain range in the background.

The four Granges of Tulare county had a unique exhibit showing in the products of the county a rough map of its territory. Prominent in the display was some dried fruit, which won first prize in its class, sent in by the Granges.

A great number of bottles of pure California oil, all attractively arranged on shelves, formed the exhibit of the Dubrovnik ranch. In addition bottles of olives were arranged about the booth. Peter Piplick, late of the royal olive groves of Austria, was in charge.

The display of apples made by George Dillon of Springville must be regarded as one of the great features of the fair. On his ranch was produced the fruit that won first at the Irrigation Exhibition at Chicago, competing against the national field on apples. The Arkansas Blacks, Ben Davis and other sorts were indeed superb specimens of their kind.

Another showing, though not of a horticultural nature, was the showing of dairy products by the creameries having their headquarters at Tulare City. Allowing for the fact that Tulare county is now the leading producer in butter in Central California, this fine showing of commercial packs of butter fat was typical of the progress and development of her dairy interests. The bulk of this product finds a market in Los Angeles.

The beauty of all of these exhibits was greatly enhanced by the color scheme of orange, green and white, with which the interior of the building was decorated. No less than twenty thousand yards of cotton cloth was used in the effort.

THE AWARDS.

Department One.

Best display citrus fruit from any locality in Tulare county:
First premium—Strathmore; $75.00.
Second premium—Exeter; $50.00.
Third premium—Lemon Cove; $25.00.

Best display of citrus fruit by any one grower in Tulare county:
First—Kaweah Lemon Company, Lemon Cove, $25.00.
Second—J. E. Barton, Three Rivers, $15.00.
Third—H. C. Carr, Porterville, $5.00.

Best display of oranges, all varieties, exhibited by any one grower:

First—Kaweah Lemon Company, Lemon Cove, $10.00.
Second—H. S. Carr, Porterville, $7.50.

Best display of lemons, all varieties, exhibited by any one grower:

First—Kaweah Lemon Company, Lemon Cove, $10.00.

Best 12 specimens of Washington Navels, exhibited by any one grower:

First—Mrs. M. E. Randolph, Exeter, $7.50.
Second—T. A. Pogue, Lemon Cove, $5.
Third—Kaweah Lemon Company, Lemon Cove, $2.50.

Best 12 specimens Thomson's Improved Navels, by any one grower:

First—E. A. Miller, Springville, $7.50.
Second—C. A. Hotchkiss, Exeter, $5.00.
Third—W. R. Senter, Lemon Cove, $2.50.

Best 12 specimens budded oranges, exhibited by any one grower:

First—H. E. Ward, Orosi, $7.50.
Second—A. J. Bump, Orosi, $5.00.
Third—W. R. Robb, Orosi, $2.50.

Best 12 specimens seedlings, exhibited by any one grower:

First—R. B. Montgomery, Lemon Cove, $7.50.
Second—H. C. Carr, Porterville, $5.00.
Third—C. E. Jaynes, Exeter, $2.50.

Best 12 specimens lemons, exhibited by any one grower:

First—Jim Pogue, Lemon Cove, $7.50.
Second—W. R. Park, Lemon Cove, $5.
Third—Kaweah Lemon Company, Lemon Cove, $2.50.

Best 12 specimens grapefruit, exhibited by any one grower:

First—Roeding & Wood Nursery Co., Exeter, $7.50.
Second—Mrs. M. E. Randolph, Exeter, $5.00.
Third—J. E. Barton, Three Rivers, $2.50.

Best 12 specimens of seedless limes, exhibited by any one grower:

First—A. Patten, Springville $7.50.
Second — Kaweah Lemon Company, Lemon Cove, $5.00.
Third—Roeding & Wood Nursery Co., Exeter, $2.50.

R. M. TEAGUE,
H. W. KRUCKEBERG,
Judges.

Department 2—Class I.

Best display of dried fruits from any locality:

First premium—W. A. Bates, Dinuba, $25.00. No competition.

Best display fresh grapes from any one grower in Tulare county:

First Premium—H. H. Moore, Dinuba, $7.50.
Second premium—W. N. Barr, Dinuba, $5.00.
Third premium—F. J. Beinhorn, Orosi, $2.50.

Best display of fresh olives from any one grower in Tulare county:

First premium—J. J. Cairnes, Lindsay, $7.50.
Second premium—Jacobs Bros., Visalia, $5.00.
Third premium—G. S. Berry, Lindsay, $2.50.

Best display of apples from any one grower in Tulare county:

First premium—Geo. Dillon, Springville, $25.00.
Second premium—W. A. Bates, Dinuba, $15.00.
Third premium—Eugene McKinley, Visalia, $10.00.

Department 2—Class II.

Best sample of strawberries—Marion Carter, Three Rivers, first, $1.00.

Second—Chas. Reich, Visalia, 50c.

Best sample of fresh pears—Marion Griffeths, Three Rivers, first, $1.00.

Second—A. Peterson, Tulare, 50c.

Best sample of Japanese persimmons—Mrs. L. L. Thomas, Exeter, first, $1.00.

Second—Visalia Orchard Co., 50c.

Best sample of quinces—J. E. Barton, Three Rivers, first, $1.00.

Second—R. N. Allen, Dinuba, 50c.

Best sample of pomegranates—B. F. Bailey, Exeter, first, $1.00.

Second—Courtney Talbot, Springville, 50c.

Best sample of tomatoes—Elias Cregg, Visalia, first, $1.00.

Best sample of white potatoes—J. M. Tout, Visalia, first, $1.00.

Second—C. O. & T. C. Newman, Visalia, 50c.

Best sample of cabbage—Tom East, Visalia, first, $1.00.

Best sample of watermelon—Clarence Fay, Visalia, first, $1.00.

Second—J. T. Lawson, 50c.

Best sample of muskmelon—J. T. Lawson, first, $1.00.

Best sample of pumpkin—Tulare County Grange, first, $1.00.

Second—J. Sub Johnson, Pumpkin Hollow, 50c.

Best sample of squash—John Abshire, (Grange), first, $1.00.

Second—J. E. Barton, Three Rivers, 50c.

Best sample of Egyptian corn—Jacobs Bros., Visalia, $1.00.

Second—Henry Moore, Visalia, 50c.

Special mention—Basket fresh peaches—Jason Barton, Three Rivers, $1.00.

Fresh eggplant—Jason Barton, Three Rivers, $1.00.

We recommend that mention be made of the fine display of assorted vegetables and cereals exhibited by Alpaugh, and that the premium of $7.50, given for vegetables, be given to Alpaugh.

J. C. BRIGGS,
B. C. ANDERSON,
M. T. MILLS,
Judges.

Department 3—Plants.

Best and largest collection of house plants:

First premium—Mrs. W. R. Spalding, Visalia, $7.50.
Second premium—Mrs. A. D. Sweet, $5.00.
Third premium—Mrs. Carrie Thomas, Visalia, $2.50.

Handsomest collection of cut flowers:

First premium—Mrs. A. D. Sweet, Visalia, $7.50.
Second premium—Mrs. J. E. Scheeling, Exeter, $5.00.
Third premium—Mrs. W. R. Spalding, Visalia, $2.50.

MRS. I. H. THOMAS,
MRS. R. C. MERRYMAN,
Judges.

Department 4—Dairy.

Best exhibit dairy products from any locality in Tulare county:

Tulare City, first premium, $75.

No entries for second and third premiums.

Petals and Thorns.

It was gratifying to learn that not a single exhibit handled by the judges showed any evidence of scale insects.

Burnishing and rubbing competitive exhibits may remove deleterious substances, but it also removes the natural bloom which "cuts" the fruit three points on condition.

One of the interesting things that were missing was exhibits of commercial or standard packed boxes of oranges and lemons, which should be added to the list of premiums at future fairs.

Five years ago Strathmore was a grain field; today she is on the map as a citrus section. The fruit she displayed was harvested from four or five-year-old trees, which fact tells its own story.

No one thing was more impressive than the elaborate system of electric lighting that was put in, not only at the fair proper, but in the town of Visalia. Every street was a perfect labyrinth of bulbs and wire.

With an executive head like J. Sub Johnson and C. F. Balaam, any sort of an old thing would be made to "go;" but when such a team is backed by a whole community, the driving power becomes a whirlwind.

If Visalia builds a pavilion capable of housing the fair in good shape, it will certainly tend to make the event an annual feature of that town. Being a central point, it has everything to commend it for such a purpose.

More careful selection of fruit in conformity to commercial requirements is advisable. Some of the exhibits shown would have been disqualified in the packing house, let alone winning honors in a competitive exhibition.

Lindsay is the heaviest shipper of citrus fruits at present in Tulare county; this distinction she will hold for a while, though other sections are rapidly developing. At present Porterville, Merryman, Exeter, Lemon Cove, Naranjo, Plano, Globe and Orosi follow in the order named.

As it is quite generally known to The Cultivator readers, this was the fifth citrus fair held in the county, and the first for Visalia. The board of directors included J. Sub Johnson, A. Lewis, Sus Mitchell, Harry C. Locey, Leon Goldstein, J. G. Fikenstein and John C. Hayes.

A. L. Hobbs, president of the Fresno Chamber of Commerce, said that, "If Fresno will not hold a citrus fair, we are glad that Visalia can and will. Fresno can hold a fine fair, but she has never undertaken anything as elaborate as this. Visalia may be in the southern part of the valley, but the success of the present fair will mean much for the valley as a whole."

Wood borers have been found to be the cause of death of many eucalyptus trees about Redlands. This pest has been a serious menace to Australian groves. The only remedy found is spearing the larvae in their holes with pointed wire.

The Ornamental Garden

TREES FOR PROFIT AND BEAUTY ON THE FARM.

Trees are dual-purpose in their returns. Profitable timber and useful beauty are their generous rewards. When our forests stood in primeval integrity lumber was cheap. One of our chief agricultural problems was to clear the land of trees and brush. With reckless, wasteful axes pioneers chopped their way to the coveted soil. Fire aided their destructive invasion. Ashes, incorporated with the leafy humus of ages, represented their work. Cultivated crops succeeded ancient monarchs of the woods. Deforestation did not stop at the areas capable of agricultural use; it went out of its way to make man's conquest complete. Trees in hollows and on precipitous surfaces were felled in order that grass might grow. Even to this day the wanton slaughter of trees continues, but thoughtful men here and there have begun to show an encouraging interest in the preservation of forests and the planting of commercial and ornamental trees.

Parts of almost every farm could well be devoted to commercial trees, planted with care and properly developed. As sources of posts, poles, ties, sills and lumber they would pay immensely, for the scarcity of suitable woods for the hundreds of uses to which they are adapted, and the keen demand for them insure profitable returns.

Trees are entitled to an extensive foothold in all agricultural regions, without regard to their attractive commercial possibilities. Our farms could be made infinitely more satisfying and charming by the presence of long-lived shade trees in yards and lawns, scattered along division fences, in pastures and even in large fields. All the land that a stately tree claims as its own can be spared by any farm-owner. Our appreciation of trees is not yet sufficiently developed to make us enthusiastic and active on Arbor Day. We like trees too well for lumber and too little for themselves. If corn is yellow and sickly under the spreading branches of a venerable elm we think of the axe instead of the grateful shade with which the tree refreshes man and his beasts. In our sordid zeal for cash we become blind to things that money cannot buy. It takes a patient, home-loving, land-loving people to see profit in forests, and we Americans are not yet qualified for such systematic, painstaking work with trees as the Germans have been doing for many years; but we are taking hold of elementary principles with promising interest.

Practical farmers as a rule do not allow themselves to be influenced by artistic values, contending that "busy men on high-priced land" cannot afford to "fool with the beautiful unless it pays." Nevertheless, almost every one of them inwardly feels and craves natural beauty in all its simpler outdoor forms. Men have planted trees, shrubs and vines who could not write their names. Women who never saw the inside of a schoolroom are instinctively drawn to floriculture, and tiny spaded beds, covered with brush to entangle the mischievous feet of poultry, could now be found in thousands of yards presided over by farm women. It is not book education that causes men and women to love trees, plants and animals. It is the passion of the inner life for outward relationships. This universal, vital emotion has much to do with man's happiness and success on earth. For this reason the beauty with which any farmer easily may environ his home and distinguish his land pays in many subtle ways. Children reared where nature has expression in trees and other forms have a resource and a quality in their later lives that prove the potency of beauty in character-building. Environment is sculptured in memory; it enters into the fiber of life. It is intimately related to adult efficiency and character.

Farmers with families cannot afford not to plant trees, evergreens, shrubs and vines for beautification and profit. If boys and girls are the best crop that our farms produce they should have their impressionable years filled with all the ennobling pictures that can be thrown upon nature's great canvas—the earth. To perfect this crop under favorable conditions it is essential to enrich, beautify and broaden country life, and in achieving these ends we shall encrease our own health and happiness many fold. A man who plants a tree delights in its growth. If in some vision he sees his grandchildren playing on the grass beneath its cooling shelter his affection for it is heightened and he is a better man.

State, municipal and private forests, managed on the same general plan as our national forests, are sure to come. So many important purposes are served by trees that the country cannot long afford to ignore them as one of our most valuable resources.—Breeder's Gazette.

MAKING A GOOD LAWN.

To make a good lawn the soil should be rich as a garden. It is too often that the soil is poor, and every crop of grass is swept off, and nothing except water given to assist the grass roots and restore the soil, and the grass is mowed close to the ground, so that instead of a soft, velvety green lawn springing to the foot, you have a hard, poor, thin, colorless piece of ground. Rich soil, good and deep, the mower set so it does not cut close to the roots, sufficient water, twice a year renew the soil with a fertilizer, or mow often and leave the mowings for a mulch, and I will guarantee a good green lawn. I do not need to say that for the credit of the workman the lawn should be so made that a straight edge will not vary half an inch over the whole.—Farm and Ranch.

One of the most wonderful roses is a wild inhabitant of the United States—the Cherokee rose. It is an emigrant from China, but it was known to botanists as growing in Georgia and the Carolinas before it was known to be a native of China. In a botanical work published in 1821 it is mentioned as having been "cultivated in the gardens of Georgia for upward of forty years, under the name of the Cherokee rose." How it first reached this country no one knows, but it soon escaped from its first American garden to the woods, and became so common there that it acquired the name of the tribe of Indians which occupied the upper part of Georgia and the Carolinas.

Garden and Field Crops

POTATO AMBASSADOR.

It was the late Dean Hole, was it not, who sang of beauty in the radish, though it lives below in gloom. For its leaves are "gay and gladdish," though its heart is in the tomb. Surely the Dean would have delighted in Mr. Eugene H. Grubb, who is now visiting the United Kingdom and Europe studying potato culture on behalf of the Department of Agriculture of the United States. Mr. Grubb is devoted to potatoes. He is a big expert. An American, with his wife and daughter, walked into a Strand restaurant of blameless repute a few days ago. "Delicious stew and joint," they said, "but the potatoes!" The Puritan father was shocked. A Strand chef acknowledged afterwards to having learned more about potatoes in ten minutes that afternoon than in all his life before. Mr. Eugene H. Grubb, of Carbondale, Colo., taught him.

"You throw away the most edible and valuable portion," Mr. Grubb told a Daily Graphic representative who talked with him at Bardill's hotel; "the outside layer, about a quarter of an inch, lying under the skin. Your people pare that off. If people were properly educated to the value of potatoes as a delicacy, the consumption of the world would be doubled. The English people do not know the luxury of a baked potato. It is one of the favorite dishes in America. Your methods of serving potatoes are crude, primitive."

Studying Potatoes.

Then why, it may be asked, is Mr. Grubb here to learn? Simply because America wants to know more about the growing and marketing (as distinct from eating) of potatoes. He is visiting all the fairs and great farms. He has been to Lord Rosedale's and Sir Walter Gilbey's; he is going to Lord Rothschild's and to Lord Roseberry's Dalmeny station. His mission means a study of the whole industry this side of the Atlantic.

"We grow, in round figures, 300,000,000 bushels annually; we need at least 450,000,000. You grow in the United Kingdom as many as we do in the whole United States, and your yields are as three to our one per acre. The state of Idaho alone could produce all that the whole United States now produces—if the industry were developed to its maximum."

Not only our extravagance in potatoes strikes Mr. Grubb. Our market methods, he says, would break an American farmer's heart. "I buy in London a basket of strawberries, £4½ or £5 10d. They are put up in a basket with a tin handle costing 3½d. In America we would put them in a package costing less than a halfpenny. I saw potatoes from Canary and Jersey arriving in crates of seventeen pounds tare in eighty-five pounds—a package made of lumber double the thickness necessary. I don't know, of course, about your social conditions. You may do that sort of thing in order to employ the great surplus of cheap labor you have here. Again, you use the old, old carts for bringing products to market. Some of them are at least seven feet high. It costs money to lift a hundredweight seven feet. In America we have low-bodied trucks and very low-wheeled carriages. On an average your English farmer raises all his crops double the height, to market or stack, that the American farmer does. Because we use machines more and more and hands less, farming in America is not restricted to people of strong physique. Some of our most successful farmers and stock people now are women."

American Farming.

"Your farms are more beautiful," continued Mr. Grubb; "your farm life has more comforts. The artistic instinct is strong in England. Your agriculturist is a factor in the social system. Your farmer wears a silk hat, carries a cane, dresses for dinner, keeps a coachman. Yet the English tenant-farmer would be looked down upon in America, where a man who does not own his own land is the object of criticism. Your successful farms are over-capitalized; ours are under-capitalized. That is the greatest drawback to American farming."

Mr. Grubb wants more British well-to-do men and women to share in the agricultural awakening in the states. But he sees a fine future at home for British farmers. "With your splendid markets and climate, your agriculture will have splendid opportunities when given methods more economical. Uncle Sam has no more farms to give away. Our granaries are exhausted; our feed lofts are understocked. We cannot send you any more cheap foods from America. You have a wonderfully bright future —brighter, in my judgment, than you have had ever since I have known anything of agriculture. Our population is increasing so rapidly that unless we study how to get better yields we shall be an importer of foodstuffs in ten years."

Which brought the Potato Ambassador back to his potatoes.—G. T., in London Graphic.

MEDICINAL VEGETABLE FOODS.

Cranberries correct the liver.

Asparagus stimulates the kidneys.

Carrots are excellent for gout.

Watercress is an excellent blood purifier.

Parsnips possess the same virtues as sarsaparilla.

Celery contains sulphur and helps to ward off rheumatism.

Bananas are beneficial to sufferers from chest complaints.

Celery is a nerve tonic; onions also are a tonic for the nerves.

Beet root is fattening and good for people who want to put on flesh.

Tomatoes are good for torpid liver, but should be avoided by gouty people.

Lettuce has a soothing effect on the nerves and is excellent for sufferers from insomnia.

Spinach has great aperient qualities and is far better than medicine for sufferers from constipation.—Snowdrift.

Remember that good drainage is important on potato fields. Potatoes will stand less excess of moisture than most farm crops, and unless there is natural drainage resort should be had to artificial drainage.

MORSE Seeds

Morse Seeds Sold Everywhere.

C. C. Morse & Co.

The Great California Seed House

115 Market Street San Francisco

BUY SEEDS BY NAME

If you were buying apple trees you would rather pay a reasonable price for named varieties, guaranteed true to name by a nurseryman than to buy unnamed trees just because you could get them cheap. Did you ever think of the fact that this same argument applies to seeds? Branded and guaranteed seeds are the safest and in the end the cheapest. There must be quality in every package, for the maker must make good goods or he can't stay in business. When you buy Lilly's Best Seeds, Northern Grown, you buy seeds that are true to name, pure and of high germination.

Don't take chances. Send for catalog. **CHAS. H. LILLY CO., SEATTLE,** for over a decade the leading Seedsmen of the Northwest. No matter where you buy, ask and insist on Lilly's Seeds, and if your dealer does not sell them write to us and we will supply you. Lilly's "Crop" Book is of great interest to farmers. Free

ter orchard practice by adopting a system that eliminates unfit and worthless qualities of fruit. They are putting into practice the admonitions that have heretofore been noticed only in the preaching. They have tried in a most practical way to elevate and make uniform the quality, packing and the retailing value and convenience of selling our orchard products.

"The effect of standardization is fourfold. First, it excludes all fruit unfit for profitable trade, and thus discourages overproduction; second, it increases the demand for California fruits, and thus makes distribution wider, more certain and less in cost of selling; third, it protects and stimulates the grower of good fruits and makes his land more valuable by eliminating from competition lands and fruits of no value; fourth, it enforces better horticultural practices, and thus gives dignity and distinction to an occupation that is now thought by many to be of such a low order that anybody can follow it successfully. It will help to bring back the right kind of fruit growers to the land.

"Let us now as briefly as possible discuss the morals and consistencies of fruit merchandizing. The signs of the times indicate that the public at large is being driven by self-protection and self-respect to enforce honesty and square dealing in the monetary and mercantile transactions of the country. Uprightness of dealing, whether involving the purity of a food or the probity of a gigantic deal in stocks; whether manipulating a false measure in selling molasses or manipulating a fraudulent corner in controlling the necessities of life or what not—uprightness of dealing is the greatest issue of modern times.

A SAN JOAQUIN COUNTY BERRY FIELD.

"The stability of our very institutions demands that the average man be given a chance for his life. But he must make himself worthy of the square deal. He must come with clean hands to demand his rights. If he 'deacons' his apples, places a false bottom in his milk measure or hides little, measly peaches in the center of the box faced with first class fruit, can he demand with a clear conscience that the corporations cease to oppress him or that bribery and graft cease to absorb his hard earned tax money?

"There is at present a great and increasing determination to revise the tariffs upon the basis of the common weal. When revision reaches the fruit schedule, California must be able to show that the present protective tariff rates are a benefit to the consumer, or at least do not materially increase the price of her peculiar orchard products that have become necessities to her customers in the East. It must be shown also that her growers and shippers have not taken advantage of the trade by foisting upon it poor qualities that could not find sale without the tariff. The verdict must be: California's fruit is worth protecting. California is not oppressing the consumer; she is furnishing him with wholesome, honest products, and her fruit industries must be protected and the interests of a great and distinctive state maintained against the cheap labor of the old countries. This idea has been one of the dominant features of the standardization, and I know of no argument so strongly in favor of continued protection as that of honest packing, high quality and uniformity of service."

Much Interest.

There have been many larger conventions held in the state. In fact, when the gavel fell at the opening session only thirty people were present. The attendance was, of course, greater at the other sessions, though at no time was it as it should have been. The local attendance was practically nothing, one of the attendants estimating that less than ten per cent of those present were from Stockton. It is proverbial that local people give these conventions scant attention, but Stockton will crowd close to first place for indifference. The local attendance at Music Hall on Wednesday evening at the reception and entertainment for The entertainment consisted of a remarkably good musical program followed by a dance.

The automobile ride failed because of threatening weather, and a trolley ride to Lodi was substituted.

The horticultural commission of the state held their meeting on Tuesday evening. The president of the association, Mr. Roy Bishop, of Orange county, presided. Dudley Moulton treated of horticultural protective measures from the viewpoint of a horticultural commission. It will be quoted from at more length in a later Cultivator.

Mr. Roeding's address on Nursery Inspection appears on page 569 of this issue. The inspectors who took part in the discussion admitted the weakness of the horticultural laws, both of state and counties, but insisted that it was to the interest of both the grower and nurserymen that the utmost vigilance should prevail. The lack of uniformity is, in fact, the greatest drawback. On this point some advocate the entire abolishing of county ordinances and dependence on the state law alone.

Wednesday and Thursday centered the interest of the convention on the reports from the different fruit handling and standardizing sections. These reports touched upon the table grape, peach, pear, and practically all green deciduous fruits. The papers read are too long to give in full in one issue, and many are being held to appear in the later issues of the Cultivator and Rural Californian. Many valuable points were made bringing out the mistakes of last year and the hopes of the coming. Thursday evening was given over to an address by W. A. Beard of San Francisco on the country life commission. In this he appealed for aid from the convention in advancing agricultural education and every possible movement looking toward the uplift of country life.

He was followed by Surgeon Rupert Blue of San Francisco on "Squirrel Eradication." Surgeon Blue reviewed the work of the Marine Hospital Service in its effort to stamp out the bubonic plague. Investigations have led to the discovery that not only the rat of the cities is responsible for the distribution of the tick which carries the disease to humans, but the rabbit, and even the house cat and the ground squirrel are carriers of this deadly disease. In fact, practically any furry animal may furnish a refuge for the tick until humans come in contact with it. The squirrel is the only one next to the rat that is of importance. Surgeon Blue gave figures showing investigations in many counties about San Francisco, and even half way up the San Joaquin Valley, an occasionad infested squirrel has been found. As yet none have been found east of the river, as squirrels have never been known to pass over a large stream. A large force of men is constantly at work killing and sending to the laboratory in San Francisco squirrels which are infested, to show the extent of the disease. It was urged that the supervisors of various counties maintain an active campaign against the squirrel pest not only because it is a carrier of this dread disease but for economical reasons as well.

Farm sanitation was handled in a very striking and entertaining way by Dr. W. F. Snow, Secretary of the State Board of Health. Dr. Snow's paper dealt with the human being very much as one would deal with horses or cattle; that is, from the commercial standpoint of value to the commonwealth. Dr. Snow began with the investments in the "animal," which were figured out in detail from $150, stork expense and nearly the same in "equipment" expense, then year by year as the child was carried through its life, until twenty years of age, it was found that the parents had invested in cash, outside of their own care and labor, the sum of $4200. As an example of the conservative figures used by Dr. Snow in estimating this cash investment in a human being, the annual upkeep, including clothing, food, etc., was placed at from $125 to $250, $250 being given during high school age. This took into account no expense for private lessons, music lessons, spending money, or any other items than the actual cost of food and necessaries. Dr. Snow assumed that the state bore all this expense which is in reality an additional investment for the commonwealth. From this standpoint he argued the necessity of protecting these human beings from preventable and postponable diseases. The ravages of the malarial mosquito were taken as one example of the five factors mentioned by Dr. Snow which could be largely controlled by care. In this he gave figures establishing the fact that the foothill sections of the Sierra Nevada which were watered by abundant streams flowing from the mountains were infested with this mosquito worse than other sections of the state. These counties have before them a great fight if they would reduce the percentage of malarial cases, two per cent of which result in death. Dr. Snow also gave figures showing the loss from the 200 or more deaths each year in this state from malaria and the 6,000 other cases which lower the earning capacity, and showed it to amount to millions of dollars yearly, including expenses for drugs, doctors' bills, nurses' care, etc. His statements were forcefully made, and we trust will serve to awaken interest in the necessity for greater care of human beings in this state.

LODI TABLE GRAPE VINEYARD.

Mr. G. P. Rixford of San Francisco, an expert of the Bureau of Plant Industry, having especially to do with the introduction of improved figs, long fibered cotton, and dates for the Colorado Desert section and in Arizona, in his address carried still farther his contention first stated at the Watsonville convention that the introduction of the blastophaga from Asia to this country was not accomplished first by Mr. Swingle or Mr. Roeding, as had been claimed prior to that time. He maintains that the beneficial insect was introduced into Stockton thirty years or more ago, and has existed there ever since in caprifigs introduced by Mr. West. Mr. Rixford's paper will be given more at length in a later issue of the Rural Californian.

One of the unexpected and very enjoyable events of the convention was the introduction to the attendants of Mr. H. E. Van Dieman, formerly connected with the Division of Pomology. Mr. Van Dieman learned of the meeting while in San Francisco on his way home from judging the National Apple Show at Spokane. He completely endorsed the papers which he heard given before the convention on the

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

SUGGESTIONS.

By Mrs. M. E. Sherman.

The lack of cleanliness seems to have become chronic in many people. The dairyman is harried from pillar to post over sanitary conditions. While he richly deserved it, still there are others. I saw a baker boy take the fresh bread from his wagon tuck two loaves under his arm, then let down the weight that kept the horse from straying. It stuck fast, when with one hand on the horse's sweaty rump he dangled it loose with the other. His hands then grasped the uncovered loaves and he delivered them. Let us hope it was a healthy horse, and one that had been groomed that morning.

Dairying.

The cow that any one milks on the farm does not receive the care the regular dairy cow expects. She is often neglected or only half cleaned and the water supplied her is scanty. The fact is that the dairy where milking is a business that is carefully looked after, supplies the cleanest and best milk. The professional milker uses dry milking as a rule. He has learned that wet milking is no easier for him, and does not practice it. The milk strainers must be kept clean, and here it is wise to watch carefully for bloody or stringy milk. Either of these are best kept out by carefully rejecting milk that shows this defect. This milk should go to the pigs if the cow that gave it is not ill otherwise. Then find out the cow and give her a good purge of epsom salts.

Smells.

The idea that smells from a cow's breath or from her droppings taint the milk has been slow to be received. Feeding onions, cabbage or alfalfa does not taint the milk directly. through the cow. No feed at all for an hour before milking should be made a rule. Dusty hay thrown into the mangers, filling the air with bacteria, will taint milk. Avoid this by having the racks filled and the grain put into the cow's manger after the stables are cleaned each time. Clean the floors, coat them heavily with gypsum and then close the doors and let the stable alone until next milking time.

Cooling.

The milk used to be run over coolers and aerators of various kinds. This was to cool quickly and let the gases escape. In theory all right, in practice all wrong. The milk did not keep sweet as long as that cooled in close containers. Cool the milk as quickly as possible in a clean place. This quick cooling and keeping cool of milk that is set in open pans has much to do with clean flavor in the butter. Where a separator is used rush the milk to it warm and after the cream is separated cool it as quickly as possible. In adding separated cream to that already in the vat, wait until the cream is cool. Usually the can containing the milk just separated is stood in the room where the rest of the cream is stored. After several hours it is added and well stirred to the bottom and sides of the vat.

Washing.

This seems a simple matter, but it requires constant drilling to make dairymen fill up the empty cans with cold water at once. Never let the milk or cream dry on the cans. After they are filled with cold water they may stand until time to wash them completely. Wash them until all the visible milk is removed in cold water, then use hot water and sal soda, follow this with pure scalding water. If there is a boiler, steam them well. If there is no boiler fill with hot water until the can is hot, then turn them upside down, out in the air to drain and dry rapidly by the heat of the tin. Never dry a milk can with a cloth, for that means trouble. Never use soap either. Cold water first to remove milk, for hot water merely cooks the milk and makes more troublesome the cleaning.

Kindness.

Gentleness pays in itself, for the cows are more pleasant to be with if they are gentle and fearless with every one. An excited, abused cow will not give wholesome milk. A little lady told me the other day of an experience she had recently. They kept one cow on account of the baby. Baby's papa was called away from home to the death bed of a relative. He was detained several weeks. A "kind" neighbor offered to milk the cow to help Mrs. Jones out during Mr. Jones' absence. After a couple of days the baby was taken ill with stomach and bowel trouble. The doctors could not find any cause but finally put the little one on some of the patented baby foods. It recovered promptly. After a week some more cow's milk was used with the results of a very sick baby. Then the idea came, maybe it was the cow. The stable was visited. The poor cow was found tied up tight and cowering down in fear whenever the door was opened. Mrs. Jones visited the neighbor and he said, "Yes, she was a mean beast and he had always to soak her a few bats in the stomach to make her give down her milk." This was stopped and the gentle cow was again petted and kindly handled, and baby never had any further trouble from the milk. If people cannot be gentle from a loving heart toward God's little ones (the animals) then let them remember it pays as a matter of dollars and cents. —M. E. Sherman.

YEARLY TESTS.

With the invention of the Babcock test in 1890, it became possible to both accurately and easily determine the butter fat production of a cow. The Holstein breeders were the first to embrace the opportunity offered by the agricultural experiment station to have their cows officially tested by representatives of the station, and thousands of such records have been made of purebred dairy cows of all breeds.

These tests have proven that it is possible for a cow to give 28 pounds of butter fat in 7 days under right conditions. But the dairy public, backed up by the experiment stations, demanded yearly tests in place of those of shorter duration, and the American Guernsey Cattle Club was the first to

inaugurate a system of yearly semi-official testing.

The other breed associations rapidly fell into line, and now all of the registry associations of purebred dairy cows are encouraging the making of these tests. The results have far exceeded what was deemed possible ten years ago.

The largest record yet made is that of Colantha 4th Johanna, that gave 998 pounds of fat in 365 days. This cow is a Holstein, and is owned by W. J. Gillett, of Rosendale, Wis.

The largest record made by the Jersey cow is that held by Jacoba Irene, with a production of 952 pounds of fat in a year, and what was more remarkable in her case was the production of 2,331 pounds of fat in 37 consecutive months.

The largest record made by any Guernsey cow is that of Dollie Dimple, that made 906 pounds of fat, commencing at 3½ years of age.

The best Ayrshire record is that of Reno Ross, 674 pounds of fat in a year.

With improved methods of feed and care, records of 1,200 to 1,500 pounds seem to be within the possibilities. A valid objection that has been offered to these yearly records published has been the fact that the cows have been pushed to the limit of production for a single year; often not producing a calf for six months or a year after the test closed, and, in some instances, never. As one who helped to draw up the first set of rules for such yearly official tests, I plead guilty to not realizing the importance of incorporating some rule that would require the cow to produce a living calf within twelve to fifteen months of her previous calving.

The first great step with any dairyman in determining the value of his individual cows is taken when he begins to treat or deal with his herd as individuals, not as a whole. Then he will soon learn that he must needs own a scale and a milk record sheet; not only that, but a Babcock test as well; and not only these, but that he must use his mind, his pad and his pencil to study the individual cow, her feed requirements and other characteristics.

In fact, he must be more interested in the cows in his dairy herd than he is in anything else, except his family and his religion.—Part of an address given at the thirty-third annual meeting of the Iowa State Dairy Association, 1909.

SUGAR BEET POISONING.

It is probable California beet growing sections will never be troubled with stock being poisoned by eating frozen beet tops, but Colorado conditions may be of interest to California stock growers. The following account is sent us by B. F. Kaupp, pathologist of Colorado Agricultural College:

"After sugar beets are gathered it is the custom to turn live stock—horses, cattle and hogs—into the fields to feed on the abundance of beet tops. Care should be exercised in the use of these fields. The tops and beets of the field should not constitute the whole feed the animal receives. Grain and other feed should constitute a part of the ration. Horses or cattle should be turned onto the fields only part of the time each day. Very little trouble has been experienced this fall, for the weather has been quite warm. If the animal engorges the stomach with beets inflammation of the stomach and intestines may result and may prove fatal. Often flatulent colic is the result. There is a degeneration of the cells of the vital organs—the liver and the kidneys.

"The Colorado Agricultural College has investigated such losses among horses, cattle, hogs and sheep. In other years, where the winter sets in early and is severe, the beets and the beet tops freeze at night and thaw in the daytime. Under these conditions there is such chemical change as to make the food extremely poisonous, if eaten in large quantities, and the result has been the loss of thousands of dollars worth of live stock. Such fields should not be pastured, as it is extremely dangerous, and if loss does occur it will prove expensive feed."

Contents

EXHIBITS AT TULARE CITRUS FAIR, Cover, 602, 603, 611.

STATE FRUIT GROWERS' CONVENTION: 595.

INSPECTION OF NURSERIES: 596, 597.
TULARE COUNTY CITRUS FAIR: 598, 599.

ORNAMENTAL GARDEN—Trees for Profit and Beauty; Making a Good Lawn: 600.

GARDEN AND FIELD CROPS—Potato Ambassador; Medicinal Vegetable Foods: 601.

LIVE STOCK AND DAIRY—Suggestions; Yearly Tests; Sugar Beet Poisoning; 604, 605.

EDITORIAL—Somewhat Personal; Lessons of an Event; Specialize-Standardize; What is Standardization; Home Packing: 606.

AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast: 607.

PRACTICAL POULTRY CULTURE.—Points on Raising Geese; Right Kind of Stock; Poultry Notes; Roup; Petaluma Show; Line Breeding: 608, 609, 610.

IRRIGATION AND FORESTRY—Forest Conservation and Taxation: 612.

BEES AND THEIR CARE—Necessity of Requeening; Short Distances: 613.

QUERIES AND REPLIES—What Separator; Chicken Pox; Book on Goats; Bordeaux; Hydrate of Line; Salt for Yellow Leaves; Bounty for Shade Trees; Pruning Palms; Persimmons on Quince; Grafting Oranges; Yellows of Oranges; Roses from Cuttings; Small Fruit Planting; Aphis on Peas; Fruit Trees for Shade; Hogs in Fig Orchard; Ground Squirrel Eradication; Market for Licorice; Pickling Olives; Loquat Tree: 614, 615.

LEGAL QUERIES—Trespass: 615.
GENERAL AGRICULTURE.—Crop Essentials; Investigation for Grasshopper Eggs; Care of the Grindstone: 616, 617.

HOUSEHOLD DEPARTMENT.—Humor; The Man of Many Deaths; Growing Old; Sweeten the Breath; Some Measurements; Pineapple Puddings: 620, 621.

PRODUCE MARKET.—Los Angeles Market, San Francisco Market; Deciduous Market; Citrus Market: 622, 623.

Somewhat Personal in Tone

The many readers of The Cultivator will notice that the major portion of its columns is occupied this week with the detailed reports of three important State functions, all worthy of wide publicity because of wide practical interest. The first was the State Fruit Growers' Convention at Stockton, which was fraught with the important matter of standardization of fresh deciduous fruits; the menace of the Mediterranean fruit fly to our rural economy; the importance of better legislation for the regulation of horticultural quarantine; and the alien land law and farm labor question.

The second was the Fifth Annual Tulare County Citrus Fair, held at Visalia, which in extent and influence must be reckoned as the best one of the series, telling in tangible form of the development and exploitation of the great citrus industry of Central California during the past ten years. And the third was a well attended meeting of fruit growers at Claremont, called for the purpose of devising ways and means for the betterment of our horticultural commission service. Particulars of these are all to be found in this issue.

In this connection The Cultivator takes pride in felicitations to itself, because it was the only horticultural and agricultural paper in the State that had direct personal editorial representation at each of these meetings, thus placing itself in a strong position close to the soil in reflecting and giving the best thought of an enlightened rural economy. Verily, if you see it in The Cultivator, it's so.

Lessons of an Event

If there is one thing more than another that leads to failure in fruit culture, it is a want of thoroughness. With but few exceptions, none of us play the game to the last notch; somewhere along the line we lag, miss a cog, and the result is a loss of revenue in the final disposition of our product. These thoughts are forcibly brought to mind by the character and "get up" of some of the exhibits displayed at the late Tulare Citrus Fair. Oranges over and undersize, some faulty in form and peel, others so pulpy that they would float like cork when placed in water, many actually green not only in taste, but appearance. Other fruits were open to the same criticism. Now in a competitive exhibit of this kind it is a mere waste of time and money to enter imperfect fruit, because in the very nature of things it cannot win. Remember that the triumphs of the world go to the people who possess the "know how." If you want to win in the show room or the market place, be thorough—put up only the very best. If you are in doubt, get wise; if you don't know how, learn. That's what the other fellow is doing all the time.

Specialize--Standardize

The State Fruit Growers' Convention, held last week in Stockton, gave attention to specializing and standardizing, more particularly the latter. Still more particularly standardizing of green deciduous fruits was made prominent. The magnificent grading system of the citrus fruit growers was not touched upon, dried fruit, greatly in need of an uplift, was only brought up incidentally, though a letter was read from dried fruit buyers in Amsterdam and Rotterdam complaining because of losses of dealers in California fruits owing to inferior grade.

But the standardizing of green fruits called forth many papers and much discussion. It is Commissioner Jeffrey's hobby and he is consistent in his claim that it is useless to continue to produce more fruit if careless and indifferent methods of packing and marketing are to continue. So for more than a year his efforts have been along marketing lines. The first effort has been to standardize or grade the fruit so as to create confidence in it and ultimately better returns.

Last year's, '09, conditions were so disastrous to many growers, and largely so because of a mass of unfit fruit being dumped on the market, often under attractive exterior, that the commissioner's efforts found ready response and the work which started in Placer county spread till several counties joined the campaign, confidence in packs was restored and better returns came to growers. Naturally gratitude to the commissioner and determination to continue and enlarge the scope of standardization was expressed in the convention.

Thursday was especially given to standardization, but in every lull in the program some delegate would spring the discussion anew and urge to greater perfection.

A resolution was introduced urging legislation which should compel standardization, but this failed to secure support to carry. The delegates felt that the campaign of education should be continued till the merit of the system should compel its more general introduction.

What is Standardization

As one large handler of fruit expressed it, "This Standardization is simply another way of expressing common every day honesty." It is the putting up of fruit so that the claim on the outside of the package is made good on the inside. As Mr. De Motte of Tehama county expressed it: "We want our fruit to be put up as well as a keg of nails. What nail manufacturer would think of putting up nails in a keg marked 3-penny, place a few 3-pennys on the surface while underneath 20's, which are cheaper to manufacture, are substituted?" Morally the nail maker is perhaps no better, but he surely has a higher grade of commercial honesty than ninety-nine hundredths of California's fruit growers and shippers. The larger, firmer apples, berries or other fruits on the top while the less desirable are hidden below is a chronic condition which the pious producer never stops to question, the practice is so common.

Of course, there are degrees in this dishonesty. Some conscienceless rascals will do anything from "stove-piping" a barrel of apples to putting boulders in a sack of potatoes. Such common thieves we do not refer to. But the other fellow who drops in an occasional wormy or undersized peach while the surfacing layer is beautiful to look upon with large, fair fruit, does it with conscience free of offense "because everybody does it, don't you know," and thinks he is fooling the buyer. He has succeeded only in fooling himself and creating distrust which results in his own financial loss.

If "standardizing" will cause a return of common honesty and the square deal which in turn will bring prosperity it is a noble work and should receive heartiest support.

Nearly Nine Billions

The annual report of the Secretary of Agriculture gives a mass of figures reporting the agricultural industries of the country which are astounding. The farm products of the year aggregated a value of almost nine billion dollars, to be exact, $8,926,000,000. Taking the values of the products of 1899 as a basis, this year's would be represented by 189 or almost 100 per cent increase in eleven years.

The greatest one item in our productions is corn, which this year holds the record over 1906, up to this time the banner year. In bushels it amounted to 3,121,381,000. This one crop alone is estimated to be worth a billion and a half, sufficient to cancel the interest bearing debt of the United States. The secretary says regarding the productions of the last decade:

"During this period of unexampled agricultural production, a period of twelve years, during which the farmers of this country have steadily advanced in prosperity and wealth and in economic independence, in intelligence and a knowledge of agriculture, the total value of farm products is $79,000,000,000."

Home Packing

Much of the green deciduous fruit is put in crates in packing sheds in the orchard and hauled directly to the cars, and where standardizing is followed, inspected and sent to market. We believe this plan will ultimately be changed to packing in larger houses in a more central way. This is the only means by which uniformity can be obtained, and we believe better results will come to the grower when that plan is followed.

One mistake of those who discuss the advantages and disadvantages of giving more attention to agricultural matters in our school system is in claiming that agricultural education makes farmers or fruit growers. There may be technical schools where arts and trades are taught, but we do not believe our enthusiasm for carrying agricultural education into the public schools should lead us to believe for a moment that they will fit the children of rural districts to become farmers. The idea should be not to make it a trade teaching proposition but a training which leads to and not away from the farm. Elementary education cannot touch all points and specialize in them as much as some would wish. There is a limit to the capacity of the child—and teacher as well.

One speaker at the State Fruit Growers' Convention, while endorsing in a general way the standardization of fruits, complained because one of the finest cars of fruit he ever sent out brought far less money than indifferent, even cull, fruit which he shipped at a later date. No grower should let such an incident influence him in the least. We have seen windfall and cull oranges sent to market which brought the grower more than the finest fruit. This was simply one of the accidents of the fruit business, and proves nothing. It cannot be gainsaid that "putting the conscience in the box" can have any other influence than the best in bringing up California's reputation so as to secure the greatest returns.

The Imperial County Fair at El Centro is occupying the attention of agriculturists this week. It is being well attended, and the City of Los Angeles honors it by sending down a special excursion, which leaves the city this, Thursday, evening, putting in the entire day Friday at the fair.

Agricultural News Notes of the Pacific Coast

Northern California

The Forest Service is busy planting forest trees on areas devastated by recent fires in Glenn county.

A site has been selected and money subscribed for the erection of a creamery at Covelo, Mendocino county.

An exhibit of silk worms was one of the features of Butte county's exhibit at the United States Land and Irrigation Exposition.

Butte county's olive crop is proving much heavier than anticipated earlier in the season and the quality is reported unexcelled.

Voters of Sacramento have decided upon a $75,000 bond issue to aid in cutting the wider channel in the lower Sacramento.

Fruit growers of Sonoma county are pulling for the next State Fruit Growers' Convention to be held at Santa Rosa in 1911.

Growers of Windsor, Sonoma county, are firmly convinced of profits from prune trees. Many new orchards are now being planted.

Deciduous fruit shipments from Superior, California, the past season totaled 14,022 carloads, more than 1000 carloads lighter than last season.

The first car of oranges out of Oroville sold in the East at an average of $3.10 per box. The crop is rather lighter than usual, but the quality is the best ever.

An almond cracker is at work on several tons of almonds at Yuba City, Sutter county. The meats are to be shipped to San Francisco for the confectionery trade.

Healdsburg prune growers are elated over big demand for their prunes in the eastern markets. They are said to be of exceptionally fine quality this year.

The hop growers of Sacramento county are laying plans for the formation of an organization similar to the Almond Growers' Exchange to handle marketing and other mutual interests of members..

The Grand Jury of Yuba county for 1909-1910 has recommended that the present road ordinance be amended to allow 3500 pounds of freight hauled over country roads regardless of weight of wagon.

The Gravenstein Apple Show Association is planning the erection of a large new pavilion on the site of last year's apple show. The building will have a frontage of 125 feet and will be built in Mission style.

Over 1200 birds were entered for the poultry show at Petaluma last week. Entries were made from all over the state, an unusually large number coming from the southern counties of San Diego and Los Angeles.

In addition to the citrus fair held in connection with the Convention of Western Fruit Jobbers at Sacramento in February, it has been decided to display apples produced in counties of Superior California. An attempt is also being made to arrange with local vegetable shippers for exhibits of celery, asparagus and other produce shipped in carload lots.

Central California

Exeter, Tulare county, shipped during the month of November 460 cars of oranges.

Lindsay, Tulare county, estimates its navel shipments for this season at 1100 cars.

Thousands of young nursery stock are being rebudded in citrus nurseries of Tulare and Fresno counties.

Creamery operators of Porterville, Tulare county, have joined in the fight against the proposed repeal of tax on oleomargarine.

The Santa Clara County Poultry Association is investigating the reports that chicken feed is being made from carcases of diseased horses.

Conditions in the raisin market are reported to be improving. Prices bid on muscats have gone up to 2¾ cents, but growers are holding out for 3 cents.

On California Day at the Chicago Land Show 12,000 loaves of raisin bread were given away, together with 10,000 cartons of seeded raisins and 2000 oranges.

An interesting and well attended farmers' institute was held last week at Turlock, Stanislaus county, under the direction of the State College of Agriculture.

A fine exhibit of Santa Clara county's products has just been installed in the rooms of the California Development Board in the Ferry building at San Francisco.

The Fresno Canal and Irrigation Company is constructing a large wasteway canal in Section Nine. This is to prevent damage from flooding during the rainy season.

An irrigator near Porterville, not satisfied with his thirty inches flow from an artesian well, shot it with dynamite and this resulted in the loss of all of his water.

The citrus fruit exhibit of Fresno county at the United States Land and Irrigation Exposition in Chicago is to be permanently installed in that city by the colonization agent of the Santa Fe.

Lindsay citrus growers are excited over the appearance of purple scale on Louisiana oranges which have been brought into that city by a tourist. Every possible effort is being made to prevent its escape to the citrus orchards.

Horticultural Commissioner Schell of Fresno county reports nursery trees, citrus and deciduous, in exceptionally healthy condition. Damage from thrips is also reported less than in previous years.

The big new bridge across the Pajaro connecting Santa Cruz and San Benito counties is expected to be completed before the heavy rains commence. It will be a great convenience to farmers east of the river.

The death is reported of Major Chas. P. Braslan, head of one of the great seed growing houses of the state. The firm which he has built up cultivates thousands of acres in the Santa Clara Valley and various coast sections and employs thousands of laborers. The immense output of seeds is marketed all over the world.

Southern California

Sierra Madre, Los Angeles county, is preparing for an elaborate flower show in the spring.

Orange county claims three crops producing a million a year each, beets, oranges and beans.

The Fillmore, Ventura county, packinghouse has been sending out its choicest lemons for the Christmas trade.

Ranchers of Riverside county report sufficient precipitation to put ground in excellent condition for plowing and grain is being seeded.

The settlers of Palo Verde Valley in eastern Riverside county are trying to arrange an irrigation district under the Bridgford Act.

Dwarf milo has some enthusiastic friends near Holtville in the Imperial valley. Its yield is said to double that of the ordinary variety.

The first commercial shipment of oranges grown below sea level was made from Mecca, Riverside county. 468 boxes were shipped to the New York markets.

The first week of orange shipments in the Redlands district this season broke all records. 62 cars were sent out as against four for the corresponding week last year.

The first season's trial of growing Armenian tobacco on lands at Yorba, Orange county, has resulted most satisfactorily and those interested are planning a great future industry.

Many pickers from Texas have arrived in the cotton fields near El Centro, Imperial county, so that there is now no scarcity of labor. Picking will continue for at least two months longer.

Coachella fig growers have begun shipping their winter crop to the Los Angeles markets. These figs are of the black San Pedro variety which produce spring, summer and winter crops in this valley.

The creamery in San Pasqual Valley, San Diego county, is arranging to test the milk of each cow in the valley every month. It is hoped that this will bring up the standard of the herds.

Starting its run on sugar beets on July 23rd, the Chino Beet Sugar Factory closed on the 17th with a run of 88,800 tons, or an average of about 800 tons a day. The total production was about 30,000,000 pounds.

Considerable interest is being manifested in Southern California in the shipping of oranges by way of Panama Canal. It is expected this will be of greater value to the lemon industry than to the orange business.

The packing house of the San Dimas Orange Growers' Association, one of the finest in the state, was burned to the ground last week. Its destruction entailed a loss of $50,000 and 200 employes were thrown out of work.

The Orange County Dried Fruit Association, which organized this last season, has been so successful in handling fruit of its members that it has decided to build and equip a packing house in Santa Ana. The association still has on hand about 100 tons of apricots.

The Coast

Whitman county, Washington, Farmers' Union, is demanding a state grain inspector and weighmaster on the Coast.

Plantings made in various parts of the Philippine Islands show that rubber can be profitably raised to a much greater extent.

Oregon's hop crop this year is estimated at 92,000 bales, according to computation made by hop dealers in session at Salem.

Ranchers of White Bluffs have established a free public library and reading room, the first maintained by farmers in the Northwest.

The quality of the 1910 hop crop in Oregon has been far superior to that of 1909 and the picking is reported cleaner than for many years.

Colorado's governor has issued a call for the first annual convention of the American Apple Congress to be held in Denver, December 15-17.

The breaking up of a buyers' combine at Pullman, Washington, advanced the purchasing price of wheat ten cents in one day last week.

Walla Walla, Washington, currant growers report ridding their fruit of worms by spraying with arsenate of lead after blossoms have dropped.

Directors of the Asotin County Poultry Association are making arrangements for a big show to be held in Clarkston, Wash., January 23-29.

Large shipments of grain are being made from Grangeville, Idaho, at $14 per ton. Many of the farmers, however, are holding for better spring prices.

Official notice from Washington says that 20,000 acres under the Tieton project will be irrigated next year and the remaining 14,000 acres in 1912.

The snow storm which swept the Rogue River valley on Thanksgiving felled a peach tree planted in 1837. Although old and scraggy it bore heavy crops each year.

Hop growers of the Coast and Middle Western States are in sympathy with the movement started by Sacramento county growers for the formation of a selling association.

The University of Arizona recommends experimenting with Smyrna figs in many of the warmer valleys, and thinks they will be a great factor in the productions of that state.

Hazelwood Farm, Spokane, claims the record producing cow west of the Mississippi river. The cow's name is Bracelet Baker of Hazelwood and she produced 29.7 pounds of butter in seven days.

County Horticultural Inspector of Okanogan county, Washington, says that as result of conscientious spraying of fruit trees during the last two years there is practically no wormy fruit in the county.

The apple crop of Wenatchee, Washington, has all been shipped, the total being 1850 cars. Of this 500 cars were summer apples and the balance fall and winter. The aggregate value of the output was about a million and a half dollars.

Coulson's

EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying powers and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the famous Coulson products and gives valuable information about Poultry Raising.

Coulson Poultry & Stock Food Co., Petaluma
Germain Seed & Plant Co.,
Distributing Agents for California

The worst thing we have to contend with in getting new customers to try

West Coast Egg Food

is the "stuffs" that have been put on the market called "egg foods," largely composed of unsound grains, mill refuse, and cheap, very cheap, Japanese rice bran and such offal. When we once get a trial of "West Coast" we have no further trouble. No such stuffs in ours. We are winning out in great shape by making first-class feeds at prices as low as those "cheap" ones. Try "West Coast" just once. 75-lb. sack only $1.80, or $45.00 per ton. If not sold by your dealer, send to us. Or, if you are distant from Los Angeles and have good grain products cheaper than to ship them in, you can make your own Egg Food as good as anybody's.

Egg-More Booklet

tells you how. It is free. Send for it. Send us addresses of 5 persons in your vicinity who have fowls, and we will send you an Anchor Egg Separator.

West Coast Mill

Office and Salesrooms, 115 Winston St.
Los Angeles, California

MORE CHICKENS—MORE EGGS AND MORE PROFITS

Big demand for poultry products at top notch prices—makes the chicken business *better than ever*. Go into it *right*. Pacific Coast poultrymen testify that

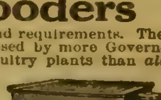
Cyphers Incubators and Brooders

the World's Standard Hatchers, give the *best results* in meeting Coast conditions and requirements. The Cyphers is a genuine non moisture incubator; self-regulating, self-ventilating. It is used by more Government Experiment Stations, by more poultry fanciers and on more big and successful poultry plants than *all other makes of incubators combined.*

The Cyphers Is Particularly Adapted to the Pacific Coast Climate

You can rely upon the results from the Cyphers—*hatch after hatch.* Mr. C. Flewelling of Petaluma, Cal. uses 14 Cyphers and averages 75% of the total number of eggs set. Bertha M. Story of Oregon City, Ore. says "I rarely have less than a 90% hatch of good strong chicks." Cyphers Incubators and Brooders are fireproof and insurable. We guarantee Cyphers Incubators and Brooders absolutely and are right here on the coast to back our guarantee. Write today for our big handsome book: "Practical Poultry Raising" and 1911 catalog of Cyphers Incubators, Brooders and Poultry Supplies.

Cyphers Incubator Company, Dept. 46, Los Angeles, Cal. Also Buffalo, N.Y.



Practical Poultry Culture

POINTS ON RAISING GEESE.

Geese are probably the hardiest of all domestic fowls. They require less attention, and little or no outlay for buildings. The two great objections to geese are the noise they make and the fact that they almost spoil a pasture for other stock. Cattle or sheep do not like to graze after geese have gone over the grass. Yet there should be a place for them on many more farms than now keep them. Under the right conditions, geese give better returns than most other farm poultry, but if you do not understand their nature and do not know how to care for them, they are often the least profitable.

By nature geese are more like cattle in habit of feeding than like poultry. They are essentially grazing animals, and too much grain will spoil them. Pure air is even of more importance to geese than to cattle. They will not thrive if shut up in buildings. If you have not a good pasture, do not try to keep geese, or at least to raise many goslings. They can be kept in yards, if fed an abundance of fodder corn, green rape, clover or other succulent feed; but this adds greatly to the expense of raising them.

While green pasture is very important for maintaining the old geese, it is indispensable food for young goslings. They must have fresh, tender grass in abundance at all times during the day, from the first day they eat to the time they are feathered and have grown their wings. After that, those intended for market may be penned and fed green stuff and grain, but those intended for breeding should continue to have the pasture and free range. If a large flock is raised, quite a large pasture is needed to sustain them.

It takes geese almost as long to attain full development as it does cattle or sheep, but they remain profitable for many years. Yearling geese are very poor breeders; two-year-olds are better; and they only reach their best at three years of age. If one wishes to make a start in breeding geese, the best plan is to buy breeding stock early in the fall. They must not only become accustomed to their new quarters, but to each other, for geese do not mate readily, and if put together after January 1 will often fail to breed that year. Old, well-mated geese of the highest quality are the cheapest and most profitable to buy. The best way, however, to get a start with young geese is to order them before they are hatched. Have the large, early-hatched speciments selected for you and delivered early in the fall. They must be kept at least one year without much profit, and two years before they do their best, but in this way one knows the age of the flock, and in the end will be likely to get much better results.

Two geese are usually sufficient for one gander, and they often do better in pairs during the breeding season. The breeding season begins usually about February 1, but sometimes one will begin to lay as early as December, then stop, and begin again in February. They usually lay from fifteen to twenty eggs before becoming broody. As soon as they show an inclination to sit they should be removed, placed in a box for a few days, with water for drink, but given no food. After this, put them back in the yard again, and they will soon commence laying.

One gander will drive all others out of the pen, if they can get out, or injure them quite severely if they cannot get out of the way. Leave one or two geese with the boss gander, and remove the others to another pen, and in the same way continue to single out pairs or trios until you have them all separated. This is for the starting year. After they are separated, put leg bands on them and record the same for future reference. It is difficult sometimes to distinguish the young from the old in the fall, and the use of the leg band is the only sure way out of the difficulty. Holes may be punched in the web of the foot, but they will grow up after a while, and the scar can hardly be seen.

I have raised geese a good many years, and always had plenty of pasture for my young stock and breeders, and always pen those that are intended for the market, and have found that they add considerable to the income each year.—Mrs. R. B. Rushing, in Country Gentleman.

THE RIGHT KIND OF STOCK.

At no time of year may cockerels to furnish new blood for next spring's hatching be bought so cheaply as now. Too many who intend to introduce new blood put off the purchase of the birds until near the breeding season. Then, because they must pay $2 each, they conclude to use their own, thus keeping up the inbreeding.

Put yourself in the position of the man who has the cockerels to sell, and see what you would do.

There is nearly as much profit in a cockerel sold now for $1 to $1.50 as there is if kept till March and sold for $1 each more, for lusty growing cockerels are good feeders, but you might as well feed what you need as to feed your own that have been inbred too long already.

Fanciers tell us that inbreeding will not result in the deterioration of your flock. Do not believe this. Where a flock is forced for heavy egg production, you need all the stamina you can get.

The fancier works for eggs during the hatching season, then lets the hens rest. Any hen, with any amount of inbreeding, ought to lay during March, April and May without showing any ill effects, but it is forced laying during cold weather that tells the story.

We who are looking for a good profit from eggs and poultry need an outcross from good vigorous stock each year, else the size of the stock and ability to lay the year through will suffer.

The time is not far off when more attention is going to be paid to building up utility flocks, and cockerels from these flocks will be in demand among utility breeders at profitable prices.

The sooner many such flocks are started, the better. Particular attention should be given to shape in the birds which are to form the foundation for such a flock. I believe firmly that the hen that is most profitalbe for poultry is most profitable as an egg producer.

We want the hen with a long body, very full breasted, which indicates large feeding capacity, and long on the keel and full behind; in other words, almost a rectangular figure. This gives, also, plenty of breast meat.

I like the quite low down hen with legs well apart. This indicates constitutional vigor. Cockerels from such stock mature into meaty broilers and roasters at an early age.

If you have heretofore bred mongrels, get some purebred birds now, of the breed you like, and continue their use a few years, getting good, vigorous, new blood each year, and note the improvement in uniformity of stock and eggs.

Farmers are awakening to the fact that a flock of good young hens is one of his most profitable sources of income.—American Cultivator.

POULTRY NOTES.

A bulletin recently issued by the Maine Agricultural Experiment Station (Bulletin 179) deals with some of the results of the poultry work carried out at that Station during the last year. The first topic treated in this bulletin is: Feeds and methods of feeding. In this section are given the formulas for a new method for feeding laying pullets for egg production. The old "dry mash feed" of the Maine Station so widely used throughout the country has been somewhat modified in the light of experimental work. Full directions for compounding the new feed are given in the bulletin. In this same connection the method of feeding breeding stock in use at the Station is described. The purpose of this special method of feeding the breeders is to gain greater fertility and hatching quality in the eggs. The problem of securing a cheap and satisfactory green food for poultry in the winter months is an important one for all practical poultrymen. The Experiment Station has been, for some time past, using green sprouted oats as a source of winter green food with highly satisfactory results. In this bulletin is described the method by which the oats are sprouted and grown at the Station plant.

A short section in the bulletin deals with the subject of keeping poultry free from lice, describing the lice powder and the lice paint which is used at the Station. Another section gives an account of the method of making the cresol disinfecting solution used for keeping poultry houses, fixtures, incubators, brooders, etc., free of vermin and for general disinfecting purposes.

Besides this practical material on poultry management the bulletin includes a long section entitled "Studies on Hybrid Poultry" in which an account is given of the experiments in progress at the Station which have as their aim to combine, if possible, desirable meat and table qualities with good egg laying ability in the same strain of poultry. By the application of modern methods of breeding the attempt is being made to develop a new race of poultry which shall be more desirable than now available.

The final section of the bulletin gives a brief abstract of some of the results of the studies on poultry biology of a more technical character which have been completed during the past year.

Copies of Bulletin 179, Poultry Notes, may be obtained on application to Director Chas. D. Woods, Maine Experiment Station, Orono, Maine.

THE FORERUNNER OF ROUP.

Look well to the condition of the coops, if the young chicks still roost in the small coops they were put out in, and they do, on most farms, roost there until sold, or they instinctively betake themselves to nearby trees, where the sanitary conditions are better. If there is not plenty of room for them to "spread out" in the coops, better remove them to larger quarters. If not possible to move them, at least divide them up so that they have room, and then see to it that the coops are kept clean and free from vermin.

Right here, in overcrowded coops, is where many an epidemic of roup and canker begins. The respiratory organs are weakened—yes, the whole constitution is weakened by breathing the air in overcrowded coops; air loaded not only with the impurities cast off by the lungs and bodies, but with the ammoniacal fumes arising from the accumulated excrement on the floors. As the cooler nights come, the

To the Poultry Raisers:

Do you want sick, mopey chickens, or do you want strong, healthy ones? Above are the kind of healthy chickens found on a ranch where Merval is used. Why not give your chickens Merval and have strong, healthy birds like these?

Merval will cure Roup in a week, and other diseases such as Canker, Chicken Pox and Diarrhoea in ten days.

Merval is also a fine tonic for run down hens. It puts them into condition again, which means more eggs.

Get a can from your dealer today. If he does not sell Merval, send us one dollar and we will forward you a one-pound can, postage paid.

Do it now. Remember, Merval won't cure dead birds.

This open front door makes perfect ventilation

Mandy Lee is Miles Ahead

It is the only Incubator without a "Sealed," Air-tight Egg Chamber. It supplies the life-giving oxygen freely, draws off the carbonic acid gas, and is saving the lives of millions of chicks.

READ the story of the Mandy Lee triumph in our new catalog. Other incubators are already preparing to imitate and profit by our great discovery.

No guessing with a Mandy Lee

You cannot afford to buy an old-theory incubator which may go out of date and be discarded next year. You should know the truth *now* about the great discovery. The book is free. Ask for it.

There IS Something New in Incubators

We have taken the boldest and most important step ever taken in incubator building. See the openings into the egg chamber? They mean the saving of chicks' lives. It is the key to *right* hatching. Ventilation in the Mandy Lee is now perfect. It goes on all the time, neither above nor below, but right *at the eggs*. Every minute of the hatch the life-giving oxygen is freely passing in to the eggs and the carbonic-acid gas is passing out. And correct ventilation is just one of the great Mandy Lee features.

We Don't Guess—We Measure

The Mandy Lee is as far in advance of other incubators in heat and moisture as it is in ventilation. We do not guess at anything. The sensitive regulator controls heat to the fraction of a degree and *we measure moisture* just as accurately with the Mandy Lee Hygrometer (one sent with every incubator). You know what you are doing. *You* measure and control moisture; *you* control the hatch. The Mandy Lee is the all-season, all climate, all condition hatcher, always producing the most and the strongest chicks.

Mandy Lee Brooders give direct contact heat to the backs of the chicks. That is *real* mothering, the most important thing in poultry. Hovers are raised and lowered as weather gets warmer or cooler—heated from end to end. Chicks do not pile up and smother. Write to-day for catalog and full information.

chickens go out in the early morning, sweaty perhaps from the close contact in the coops, and a decidedly chilly atmosphere, and by and by there are catarrhal symptoms, if no worse, and the fowls fail to develop as they should. Small wonder that they are not doing well. The wonder is that so many live through such conditions, which are not at all unusual.

Overcrowding in coops, and in houses later, is the most prolific source of disease, and the key to the poor results often reported. Plenty of fresh air they must have, if fowls are to do their best in any way; even the food they eat, important as we think it, is not of so great importance as fresh air, for hens will give excellent returns on almost any variety of food if sanitary conditions are right, while no amount of food or "balanced rations" will counteract the effect of impure air and vermin.—Green's Fruit News.

THE PETALUMA SHOW.

Petaluma shows her great resources once a year. It is an exhibit worth going miles to see, for the aristocracy and utility of featherdom blend in harmony to produce a sight to delight the eye of the fancy and business poultryman. At no other show is there so much to be seen and admired. All breeds and nationalities, all shades of color, all sizes are assembled. A magnificent male chorus keeps constantly sounding the praises of the Empire of Poultry. Petaluma surpasses all other cities of the world in the production of hens and their fruit. This city last year sent out more than 7,000,000 dozen eggs and 120,000 dozen chickens for the market. The soil is particularly well adapted to poultry, and transportation facilities make it exceedingly inexpensive to reach San Francisco, where most of the shipments are sent.

While Petaluma is primarily the home of the White Leghorn, she does not confine her exhibit to this type alone. Neither does she restrict herself to her immediate locality, but with an open-hearted spirit she invites friendly competition from whatever source the best birds may be drawn. It is this generosity to outside interests that has strengthened the position of Petaluma. It has shown the necessity of constant improvement to keep ahead of her numerous rivals.

The exhibit speaks volumes for the poultry industry of California. The great hall known as "Dreamland" was beautifully decorated with vari-colored flags and ribbons. Magnificent in its festive dress, the place afforded a delightful setting for the feathered display.

They were all there; chickens, geese, ducks, turkeys and pigeons. The total number of entries was 1,218. The largest showings were those of Buff Orpingtons, Rhode Island Reds, Barred Plymouth Rocks and White Leghorns. Imported Faverolles were shown in exceptionally large numbers by Jack Lee, of Petaluma.

Mr. Charles McClave, of New London, Ohio, was the judge, and his awards gave general satisfaction. He was careful and conscientious in his work. The best individual winning was made by Mr. Scrutton, manager of the Coulson Poultry and Stock Food Company. He had ten entries, and secured five first prizes, all the firsts in their respective classes. Mr. Scrutton is a great believer in proper food for best results, and his winnings show the quality of food produced at his company's mills.

We have praised the properties of charcoal before but too much cannot be said in its favor or in urging its genral use in the poultry house, says the Kansas Farmer. The poultryman who keeps charcoal always before his fowls will save himself a great deal of trouble, provided he follows proper methods in other directions. Charcoal has the power of absorbing large quantities of gases and neutralizing their effects. When fowls are given access to crushed charcoal they will eat large quantities of it and this not only absorbs and neutralizes noxious gases in their stomachs, but it seems to have beneficial effects in other directions. In most towns crushed charcoal can be bought and most supply houses and dealers keep it on hand, but in the event that these sources of supply are not available, it is quite easy to make a supply of charcoal for home use. Where corn is grown a good charcoal may be made from corncobs. Pile up dry cobs and set them on fire and when they are a glowing mass of coal extinguish the fire with water, or better, cover the pile with earth until the fire is smothered and let the cobs cool down. A very good substitute for charcoal is parched corn, which has been kept over the fire until it is thoroughly charred. The hens may not eat this readily at first but after they have become accustomed to it they will eat it greedily.

LINE BREEDING.

Here is a concise statement of what is meant by line breeding. "Line breeding is the best method you can follow to start a strain," says the Nebraska Farmer. "It may be described as selecting a male and female that are as near ideal as you can get hold of, and mating them. The following season mate the sire to the best one of his daughters, mating the original dam to one of the best cockerels of the first year's mating. The third season you breed together two birds of the second season's mating, one from each side, and you thus have 50 per cent of the original blood of both birds on each side, and still do not mate brother and sister."

Frank V. List, representing the Pacific Oil Mills of Seattle, has been in Los Angeles the last few days, and has succeeded in placing "Proteina" Soy Bean Oil Meal with the Germain Seed Company and Henry Albers. "Proteina" is a new feed on this coast, but has been fed in Europe for many years, last year 600,000 tons being exported from Manchuria to Denmark and England. The agricultural department, Bulletin No. 372, makes the remarkable statement that a bushel of Soy Beans is equal in feeding value to two bushels of corn. Prof. Jaffa, of Berkeley, and Prof. Thatcher, of Pullman, Wash., agree that "Proteina" Soy Bean Oil Meal contains between 45 and 46 per cent protein and less than 10 per cent fat. These figures will appeal at once to all scientific poultry feeders and dairymen. "Proteina" has been tested on this coast for the last twelve months, and the leading dairymen in the Northwest are using it, and have found it much better than linseed oil cake meal, being half as rich again in protein as the oil cake. We are predicting a large sale of this feed in California.

It has been conclusively proven that hens kept in a yard and fed right will lay more eggs than hens that run at large all over creation. The feed bill will not be so large either, a fact that is worth considering.

Incubators and Brooders
The evidence is conclusive that the PETALUMA is the best Incubator buy that can be made. The best value for the money ever offered and is appreciated most by those who have had varied experiences with other incubators. Why? Because it hatches such large, strong vigorous chicks. More Petaluma Incubators were installed in the large hatcheries last year than all other makes combined. No other incubator in the world has a hatching record to equal the Petaluma.

(Continued from Page 603.)

subject of standardization of fruits. He stated that most emphatically the only way the fruit grower could secure greatest results was by creating a belief that his package contained an absolutely honest pack. Asked as to the comparison of Pacific Coast apples with the best apples produced in the East, Mr. Van Dieman said that he had seen as fine apples grown on the coast as any ever grown in the East, and he thought that with care in selecting varieties, and greater care in packing, that California and all the coast has a great future as an apple producer. While urging Californians to put up a more honest pack of apples he admitted that this state was in advance of New York methods, many packers there assuming that if facing layers on both ends of the barrel were satisfactory everything else in the barrel might go.

Resolutions.

Of course resolutions were passed fully endorsing the standardization movement which expressed the hope that greater extension of the plan would result from the first year's experience. Commissioner Jeffrey's efforts along the line of standardization were heartily commended. Agricultural education in schools was urged that it might develop the best in our state and nation and encourage the industry which is the foundation of all commerce. In addition it was urged that the state provide the necessary amount for the training of teachers along these lines. Another resolution which had fullest support recommended that the state make a greater appropriation that quarantine measures might be more effectively carried out. Another called for the appointment of a committee of five to consider methods of marketing fresh fruits in the East. Still another asked the enactment of a law restricting occupancy and ownership of land in this state to citizens who are freeholders and home builders. The committee of five was appointed by another resolution to have charge of legislative matters.

COUNTY OR DISTRICT FAIRS.

A number of representatives of counties in the Sacramento and San Joaquin Valleys met in Stockton last week and discussed the renewal of appropriations from the state for district fairs. Until the administration of Governor Budd the state made an allowance of $1500 a year for each of the various district fairs. Some of these had degenerated until they were merely horse trots and often were held simply to secure the appropriation from the state. The Fresno delegate stated in the meeting that the last Fresno fair which received the appropriation was held simply to pull down the $3,000 which was due to the district for the fair of that year and the preceding year when the fair was not held.

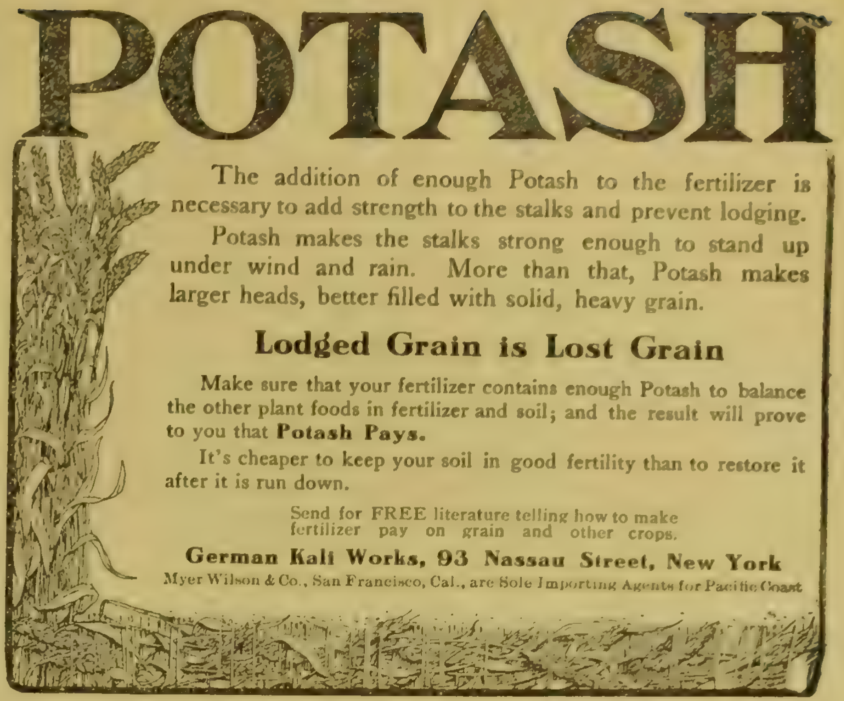
The meeting was called to order by Mr. J. M. Eddy, Secretary of the Stockton Chamber of Commerce, and President of the organization which has been formed to promote the district fair movement. There was a representative attendance from as far south as Tulare and from the northern end of the Sacramento Valley. Diverse opinions were expressed as to whether the fair should be a renewal of the old district fair or one held in each county. The general judgment seemed to be that with California's fifty-seven counties an appropriation for each would be too heavy a drain on the treasury. Some of the wealthier and larger counties were inclined to find the county plan more desirable, and the discussions resulted in no definite recommendation being made. The whole plan of work and the securing of proper legislation was referred to the executive committee, which will hold another meeting in Stockton in a short time, when it is expected that committees will be appointed to present the matter in the state legislature.

It was gratifying to note that the general sentiment was in favor of an agricultural fair rather than a vaudeville entertainment which has been the general plan of county and state fairs in many sections of the East and to a certain extent in this state. Mr. W. J. Kenney of the California Harness, Horse and Breeders' Association presented a statement from Governor-elect Johnson, in which he said: "I favor a properly conducted state fair and a limited number of district agricultural fairs, and believe in their proper encouragement and support by the state. If elected Governor I would favor and sign a bill appropriating money for district fairs and will insist that they be conducted in such manner as to make them of educational value in bringing out the best products of the state."

A LIVE HORTICULTURAL CLUB.

There are so many farmers clubs, granges and other local organizations in California that the Cultivator cannot keep in closest touch with all. But one of them held a meeting on last Saturday which was of enough importance, not only locally but in a state way, to be referred to at some length. This was the regular monthly meeting of the Claremont Horticultural Club at the home of Prof. A. J. Cook. There are only 35 members of the club but the attendance usually runs from 60 to 80. There were over 80 present on this occasion. The special discussion was on legislative matters. Some of the most important legislative acts pertaining to agriculture in this state have had their inception in this club. Our present fertilizer act is an instance. The special discussion at the last meeting was the condition in the Los Angeles Horticultural Commission which is not satisfactory to the members of the club. It was openly charged at this meeting that the appointment was purely a political one forced through against the best judgment of the majority of the fruit growers of Los Angeles county though it was much better than the appointment first slated by the board of supervisors. Three members of the board of supervisors of Los Angeles county and also the state senator and assemblyman of the district in which Claremont is located were present, and the matter of amendment of the present law authorizing county horticultural commissions was discussed. In short the discussion resulted in the suggestions that the original horticultural inspection law should be taken up and passed. The fruit interests were not strong enough at the time it was introduced to carry it through and different concessions were made to politicians. This is now seen to have been a great mistake and the growers are demanding the original bill and the removal of the points conceded that the appointments should be from the county, that the examining board should be appointed by the governor instead of through the state university and the state horticultural commission, and that the commission may have the power of appointing two deputies.

A committee was appointed to present the matter of securing this legislation to the California Citrus Growers' League in the hope that this great organization may be strong enough to secure the support of the legislature and have a law in the interest of fruit growers instead of politicians.



POTASH

The addition of enough Potash to the fertilizer is necessary to add strength to the stalks and prevent lodging.

Potash makes the stalks strong enough to stand up under wind and rain. More than that, Potash makes larger heads, better filled with solid, heavy grain.

Lodged Grain is Lost Grain

Make sure that your fertilizer contains enough Potash to balance the other plant foods in fertilizer and soil; and the result will prove to you that **Potash Pays.**

It's cheaper to keep your soil in good fertility than to restore it after it is run down.

Send for FREE literature telling how to make fertilizer pay on grain and other crops.

Irrigation and Forestry

FOREST CONSERVATION AND TAXATION.

Conservation, from a question of obscurity only ten years ago, has become one of the most vital issues of today, an issue which is essentially economic, and which should not become political or personal. Of the many natural resources that should be conserved, there is none more important than the forest. While the nation and the state are working to devise ways and means of conserving our forest resources, we are at the same time, in a real sense, taxing our timber to death. In those parts of the country where timber is plenty, little heed is paid to the fact that forests are a crop, just as much as grain, and when the individual owner is obliged to pay an annual tax on his growing timber, it is no wonder that he cuts, and usually cuts all. It is the most direct way of escaping practical confiscation through taxation.

Many of the states have passed laws to encourage the planting of trees. If it is a good thing for the state to thus encourage planting, it certainly is a good policy to encourage the forest owner to cut his timber conservatively, and under the best method of forest management. Two great things are keeping many timber-land owners from adopting forestry methods, and these are fire and taxes.

When, by a vigorously enforced uniform law, the responsibility for carelessness which causes fire is well fixed and enforced, as against individuals and railroads, we can properly prevent forest fires. The principle of fire laws is to prevent fires, and this principle should obtain in enforcing as well as drafting them. I believe that the only effective fire system is one where a force of trained fire wardens is provided, whose first duty is fire patrol, and who are sufficiently paid for their work.

As was stated in the report of the National Conservation Commission, from now on the relation of taxation to the permanent usefulness of the forest will be vital, and of the first importance. Our present tax laws prevent reforestation of cut-over lands and the perpetuation of existing forests by a proper use and economic cutting. The importance of the proper use of our privately owned forests becomes immediately more apparent when it is realized that forests privately owned contain at least four-fifths of the standing timber of the country. The Forest Service tells us forestry is now practiced on seventy per cent of the forests publicly owned, but not on more than one per cent of the timber lands privately owned.

How are we to perpetuate our timber resources and care for the future unless the best principles of forestry are practiced by the individual owner? This can be brought about best, in my judgment, by uniform laws for protection from fire and for proper taxation. We tax our forests under the general-property tax, a practice abandoned long ago by other great nations. In fact, we are the only advanced nation with the crop of standing timber on its annual tax roll. As long as forests are taxed on the basis of an annual crop, the holding of young forests until they mature means financial loss to the owner. Under such conditions the establishment of new forests cannot be expected. I believe that the taxation of forest lands should be based upon the yield, when the timber is cut. The timber should be taxed separately from the land, and only like other crops, after it is harvested. The land alone should be taxed annually. The tax on the timber itself, when cut, and an annual tax upon the land, exclusive of the timber, is practical, certain, and fair, and well adapted to American conditions of forest investment. It would insure a permanent revenue from the forests, in place of a temporary one. Such a law would be a tremendous improvement over the present system of taxation, which encourages and even compels forest destruction.

It is realized that the principles which are here recommended cannot be genrally adopted without amendment to the constitutions of many of the states; but a growing public interest in the subject will compel such amendments and open the way for a system of forest taxation which will really encourage the holding of timber and the reforestation of lands otherwise of little economic value. In some of the states steps have already been taken to this end.

As has been well said, "it is better from every side that forest land should yield a moderate tax permanently than that it should yield an excessive revenue temporarily, and then cease to yield at all."—American Forestry.

If you gain your living by your intellect, do not allow your arms and legs to get stiff from disuse; if you earn your living by physical labor, do not allow your mental powers to get rusty, but enlarge your mental outlook by thought.—Medical Review.

This Pump
Will Interest the Irrigator

Pump has Water Sealed Gland, Enclosed Balanced Impellor. Will not cut out by sand. Can be placed in a smaller pit than any other pump. Our Bulletin, C12, tells all about it. We have a permanent branch house at

Free Automobile Show

After you have carefully examined all other makes. After you have listened to the old story of what they will do and what they can do.

Then—take a look at the car that speaks for itself. The real perfect score car. The car that dreads nothing.

The experience of the Moline Automobile Company as extensive gas engine manufacturers, covering a period of more than fifteen years, has enabled them to perfect a motor which is simple in the highest degree, yet remarkably efficient and smooth in operation.

THE LONG STROKE MOTOR—4x6.

is a feature not found in cars selling at the Moline modest price. It is an improvement in line with extended foreign practice and the higher priced American cars.

The advantage of the long stroke motor is that IT DOES NOT HAVE TO REVOLVE SO FAST to deliver its power. In other words, the long stroke motor will wear longer than the short stroke motor. The high gear can be used at a very low rate of speed. In hill climbing it provides greater power development. This is only one of the many improvements found on the 1911 Moline, it has—

Larger engine—36x3½ wheels, larger tires, longer wheel base, longer springs, more power, more speed, more style, double independent ignition system.

We furnish each Model completely equipped at the following prices:

Touring Car	$1850.00
Toy Tonneau	1800.00

This equipment includes Mohair Top, Perfection Glass Front, Speedometer, 2 Gas Lamps and Generator, 3 Oil Lamps, Horn, complete set of Tools, Jack, Tire repair outfit.

THE
MOLINE
"35"
(Licensed Under Selden Patent.)

Will be on exhibition only at 602 North Main Street (Opposite the Plaza).

We Will Not Exhibit at Either Show.

We Want a Few More Live Agents.

Bees and Their Care

NECESSITY OF REQUEENING.

In modern apiculture it is necessary for the beekeeper to be able to get queens, at any time. Many beekeepers requeen all their colonies every year; others requeen every two years; it is necessary, then, that they have some method of rearing good queens to use in this way. Even where frequent requeening is not practiced, it is nevertheless often necessary to replace queens which do not come up to the standard in egg laying. Again, it often happens that a colony becomes queenless by the accidental death of the queen. Such a colony, if left to itself, will rear a queen, provided there are young larvae in the combs, but few beekeepers are now willing to intrust so important a matter to the bees.

Frequent requeening is a very necessary thing if the best results are to be obtained. It is a well-established fact that queens lay more eggs during the first year than in any other, and that the number of eggs laid gradually diminishes until the queen is replaced, because of inability to keep up the colony. Every beekeeper knows, too, that, all other things being equal the greatest amount of surplus honey is produced by the most populous colony. It is evident, then, that frequent requeening means the maximum honey production.

It has not yet been shown that requeening more than every second year pays for the extra labor, but the best beekeepers hold that queens should not be allowed to live longer than that time. There are, of course, exceptional cases in which the queen will keep up the population of a colany for two or even three years longer than the time given; but unless every colony can be watched constantly it will not pay to risk keeping queens more than two years old. An exception to this rule occurs in large queen-raising apiaries where it is desirable to have large numbers of choice drones always on hand. Since old queens lay a much larger proportion of drone eggs, it is often desirable to keep one or two old queens of select stock on this account. There is no evidence that drones from old queens lack anything in vitality.

It is also desirable to have extra queens on hand when the number of colonies in the apiary is to be increased by division or by any of the methods of artificial swarming. If a queen is provided as soon as the increase is made, the new colony will gain about three weeks in brood production over a colony which has to produce its own queen.

The question which arises in the mind of every beekeeper is: Will it pay me to rear my own queens? Very good untested queens can now be purchased for $1, or even less, it is true; but where a large apiary is to be requeened, this amount, though small for one colony, reaches considerable size when multiplied by a few score; and if this amount can be saved and the total net receipts of each colony correspondingly increased with comparatively little labor, it would seem folly for the beekeeper to persist in purchasing queens.

It will, of course, be necessary for the average beekeeper to buy some queens. The selection of fine strains of stock must be left to the professional queen breeder in most cases, and it will be well to buy the breeding stock from some such person. Where no particular improved strain of stock is desired, it may pay the extensive beekeeper to buy an imported queen to be used as a breeder. In the case of Italian bees this does not seem necessary, for very superior stock is reared in the United States, and queen bees of the Italian variety are actually shipped from this country to Italy to be used as breeders. In Carniolan, Cyprian and other races not so much selection has been carried on in this country, and in consequence the desirability of importations is greater in order to insure purity of stock.

Few beekeepers are so situated that they can with profit rear their own breeding stock. It is the rule in some apiaries to choose the queen from the colony with the best honey record as the breeder for the following year, but this, while seemingly good policy, leads to curious errors. Unless it is certain that the queen is of pure stock or of a fixed cross she should not be used, for it is a well-known fact that when a first cross is used as a breeder the resulting offspring are most variable.—Bulletin 55, U. S. Department of Agriculture.

SHORT DISTANCES.

We have had such good success in moving colonies a few rods without having the bees return to the old location that we think the advice sometimes given to move colonies a couple of miles temporarily, and then later bring them back to the new location in the old yard, is now entirely unnecessary. In one moving, October 15, about a dozen colonies were taken away from the north side of a tree and carried to the south part of the apiary. The hives had been arranged in the form of a circle around the tree, and all were removed except those on the east and south side of the tree. As mentioned we smoked the bees thoroughly and pounded the hives vigorously in moving, in order to make sure that the bees filled up before flying.

After about two weeks, when we again had occasion to go to this yard we found that the hive on the east side next to the place where the other hives had formerly stood, contained rather more bees than it did originally, showing that a few had gone back to the old location; and, not being able to find the hive, they had gone into the one nearest. This only goes to show that, when hives are moved in this way, no one hive should be left very near the old location unless it contains a weak colony that should be strengthened. But practically all the few bees that return are old bees any way, and it is a question whether the colonies that lost them will suffer much, or the colony that gained them be much ahead in the long run. Of course, we are referring now to moving that is done in the fall of the year.—Gleanings.

They's good an' bad in most ev-ry-buddy, an' you kin allus git whichever you're lookin' after.

Digs Twice as Fast as Bar and Shovel

This Keen Kutter Post Hole Digger, shown here, is a *labor-saving* tool—really is *two* tools in *one*. It takes the place of ordinary bar and shovel and sinks a hole much faster and cleaner.

The two illustrations show how it operates. Simply drive the sharp crucible steel blade of the

KEEN KUTTER
Post Hole Digger

E.C. SIMMONS KEEN KUTTER TRADE MARK

into the soil as you would a common steel crowbar, spread the handles and *lift*. It is *sure* to hold securely and bring up a full load of earth.

Every farmer's tool-house should hold this post hole digger and a full line of Keen Kutter hand farming tools—forks, scythes, hoes, rakes, axes, spades, shovels, corn knives, etc.; and his shop should be equipped with Keen Kutter carpentry and blacksmith tools. Sold under the famous Keen Kutter guarantee, which means satisfaction or money back.

California Cultivator

Clubbing Price List

FOR THE SEASON 1910-'11

Prices are Good to Oct. 1, 1911

This magazine price list is prepared annually for the convenience and benefit of Cultivator subscribers. The prices given allow our readers the benefit of the lowest figures possible, in return for which, all we require is that to all orders a year's subscription to the Cultivator (class 18) be added at 90c (regular price $1.00 per year).

This year the pricing of various combinations of magazines is a simple matter; all are listed according to class number and this class number multiplied by 5 gives the cost price.

EXAMPLE:

Class No.		Regular Price
20	American Magazine	$1.50
16	Delineator	1.00
37	World's Work	3.00
18	Cultivator	1.00

91X5=$4.55. Club price for all. Amount saved on this club, $1.95.

We desire to especially call attention to this complete list of the most popular magazines. We can, however, supply any periodical published, at the lowest price, and any not listed here will be quoted on request. Let us make you a price on any combination you may desire.

Periodicals in any combination may be ordered to the same or different addresses. Foreign or Canadian subscriptions are extra on account of added postage and prices must be gotten by correspondence. Subscriptions may be either "new" or "renewals," but it is important that this information be given in each case.

Books—Send us a postal for our list of agricultural books which we supply subscribers and which we recommend as most suited to California conditions.

Don't overlook this special:

The California Cultivator (weekly)
The Rural Californian (monthly)
Both one year for $1.50

Our Money-Saving Combinations:

The price of the Cultivator and any single magazine may be obtained by adding 90c to the class price of the magazine desired.

Make up your orders from the following, noting that the class numbers multiplied by 5 gives the cost price. Also bear in mind that **all orders must include a year's subscription to the Cultivator (class 18) at 90c.**

The Cultivator Publishing Co.

115-117 N. Broadway Los Angeles, Cal.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

What Separator?

I wish to get a separator for use in our family. We have two cows. Will you kindly tell me what make and size I will find the most satisfactory? —B. P. G., Eagle Rock.

I have used Empire, De Laval, Sharples and Danish Western — all did good work. I would buy the separator that had an agency nearest to reach. The fact is all are good enough in the standard makes. I would not buy a mail order house machine, as those I have seen were flimsy, but I would examine the machine carefully and secure instructions from a good operator as to running it properly and well. The skill required is not great, but the separator will last longer if run according to the designer's plan. —M. E. S.

Chicken Pox.

I had a hen whose head broke out in scabby sores different from anything I have seen in a life's experience. The first sore appeared on the eyelid, then anywhere about the head and one on the foot. She did not seem sick. I put her in hospital and used Germozone for a week or more, then concluded to kill her. Now find others affected. Droppings healthy, appetite good, and apparently laying. Hens have roomy quarters, good ventilation and all kinds of care. —A. R. S., San Luis Obispo.

This is a plain case of chicken pox.

In treating, wash the birds' faces and combs with carbolic soap suds; anoint with vaseline or fresh lard.

Also Chicken Pox.

Chickens first start with small sores on their eyes which resemble warts. They get larger and more come and extend to the end of the bill. They cannot see a thing by this time. The sores seem to itch as they will scratch them until they bleed.—W. P. M. Hanford.

See answer to similar query in this issue.

Book on Goats.

Where may I secure a book giving information on goats? Where do the Toggenburg and Saanen come from? —J. G. S.

We do not know of any book especially given to milch goats, but would refer our subscriber to "Types and Breeds of Farm Animals" by Chas. S. Plumb, which gives descriptions of milch breeds of goats as well as other domestic animals.

The Toggenburg is from the Toggenburg Valley in Switzerland, the Saanen from the valley of that name, also in Switzerland. Some claim that they are the same breed with only slight differences produced by the fancy of the breeders in the two sections, and that they vary only in minor points.

Bordeaux.

Have peach orchard of five acres and would like to know how to spray with bluestone and lime. We notice it takes a long time to dissolve the bluestone. Is it proper to dissolve it in hot water?—Subscriber, Gridley.

If our subscriber will refer to the issue of the Cultivator of November 3rd he will find full directions for making the Bordeaux, or, as he says, the lime and bluestone. The dissolving is much more rapid if the bluestone is suspended in a coarse sack near the surface of the water in the barrel, but if thrown into the barrel and allowed to settle to the bottom the process is much slower.

Hydrate of Lime on Alfalfa.

Is hydrate of lime any benefit to alfalfa on sandy loam? How much should be applied to the acre?—Subscriber, Modesto.

Alfalfa requires a lime soil for best results. As to whether it would pay to apply hydrate of lime, that can only be told by analysis of the soil or by experiment, preferably the latter. We would imagine, however, that crushed lime rock or a low grade of air slacked lime would be preferred to the hydrate as to cost, and doubtless would be fully as effective.

Salt for Yellow Leaves.

What is the value of chloride of sodium, common salt, on mottle leaf orange trees, and how much should be used. Understand this has been used to advantage on such trees.—N. P. M., Baldwin Park, Los Angeles.

This is a new suggestion and we question the benefit from the salt treatment. However, we will be glad to hear from subscribers who have made the application.

Bounty for Shade Trees.

Is there any bounty paid or allowed by the county or state for shade or ornamental trees planted along roadways. Also what are the regulations as to pruning and removing shade trees?—R. W. F., Colton.

It is certain there is no bounty paid by the state, and we know of no county that pays one. The increase in real estate values is in a sense a bounty, however. Many municipalities have made certain restrictions as to planting and have named certain trees which may be planted on the streets. Pruning is also under municipal direction and it is a subject on which there is need of more legislation and uniform action.

Pruning Palms.

How should I prune fan and date palm trees? I wish mine to grow high.—Subscriber.

We never have heard of any particular requirements in the matter of pruning, the usual plan being to take off leaves as soon as they turn brown. Again, when near a path or where it is desired to keep them out of the way the leaves are pruned off as fast as they become objectionable. This regardless of the season of the year, so far as we have ever heard. The tall growth is a matter of variety more than of pruning, that is, with the fan palms, the Washingtonia; with this family the robusta grows taller than the fillifera.

Persimmon on Quince.

Can Japanese persimmon be successfully budded upon quince stock? Subsciber, Sultana.

We cannot answer this definitely, but would doubt very much the possibility, for the quince is of an entirely different family from the persimmon. The quince will accommodate the apple and pear, but other families could hardly be expected to adapt themselves to it.

Grafting Oranges.

How may I graft over a seedling orange and what is the best time of the year?—Subscriber, San Jose.

Grafting is not followed with citrus trees, budding being preferred. If the tree is old with the younger branches so high as to leave the top too much up in the air, it is best to cut off in early spring, say February or March, some of the larger limbs, leaving part of top, when these limbs will send out a number of strong young shoots. The following fall these shoots may be budded and the buds will remain dormant until spring. In case the bark is not too old and thick and will still lift, budding may be done directly if care is used in securing as old budding wood as possible. This should be in March or April when the sap is flowing, as will be manifested by strong young growth.

Yellows of Oranges.

What will overcome yellow leaf of orange trees?—Subscriber, Sultana.

This is doubtless chlorosis or mottle leaf of the orange tree. It is a condition variously ascribed to poor mechanical condition of the soil, too much magnesia, hardpan, lack of nitrogen and many other causes. Past Cultivators have given much attention to this, and by referring to the file our subscriber may find much information in the query and citrus departments. Generally improvement of conditions and fertilizing with stable manure usually give relief.

Roses from Cuttings.

How can I grow roses from cuttings?—Subscriber.

Rose cuttings may be made at any time when the parent plant is dormant. Best results are secured by rooting in clean sand in glass houses. But roses root so rapidly that we have seen cuttings taken from the bush, the cutting being say ten inches long, and the size of a lead pencil, two-thirds of it buried in the soil in which it is to remain, after that being given regular gardening care. Three-fourths or more of the cuttings will root and give blossoms the first season. There are some varieties, however, like the Marechal Neil, which are almost impossible to root.

Small Fruit Planting.

Should grapevines, blackberries and other small fruits be planted in rows running north and south or east and west?—Mrs. A. C. D., Bell Flower.

We never have heard this discussed except where the small fruit were interset in orchard. In such cases many growers think that they secure more sun and are more thrifty if planted in rows running north and south, but as to direction of the row where the entire field is given to culture of small fruits, we would not consider there was any preference.

Aphis on Peas.

How can I get rid of aphis on peas, also mildew?—C. B., Highland.

Probably the best spray for aphis is kerosene emulsion or tobacco extract wash, but they are persistent and will require frequent sprayings wherever conditions are favorable to their increase. Mildew may be controlled by spraying with sulphide of potassium, formula for which may be seen in the Cultivator of November 3rd.

Fruit Trees for Shade.

What are the tallest fruit trees I can plant for shade on western side of my bungalow?—Mrs. A. C. D., Bell Flower.

Except for being infested with black and brown scale, the apricot is one of the best as it is a very strong grower and one of the best shade trees. If planted they should not be so near the bungalow that they cannot be sprayed to keep free from the scale which exudes a honey dew, often dropping on porches and walks. The walnut is also an excellent shade tree. If an evergreen is desired the olive is an exceptionally fine tree, but a slow grower. The pear is a close growing tall tree, but has little shade value.

Hogs in Fig Orchard.

Will hogs pastured in fig orchard injure the trees? Will it injure the trees to put land in alfalfa? Have grown Egyptian corn among them. We do not need to irrigate as alfalfa will do well without it.—Subscriber, Goshen.

We do not believe best results in fig culture can be had when growing alfalfa between rows. A warmer condition of the soil is required than is possible when the land is shaded by the alfalfa. Besides unless the supply of moisture is very great the alfalfa will remove sufficient to deprive the figs of their required amount. Both the questions of moisture and fertilization should be considered, for if crops are removed continually in addition to the requirements of the fruit trees, the trees will surely suffer. We do not think the hogs would do any injury whatever; in fact, would be a benefit to the orchard.

Ground Squirrel Eradication.

Is there any law in Kern county or in the state requiring eradication of ground squirrels?—Discouraged Subscriber.

This subscriber's land is surrounded by unoccupied land which is infested. He should appeal to the authorities of his county for the enforcement of the state law to compel cleaning up of the surrounding land. Whether Kern county has an additional ordinance in the matter we are not informed.

Market for Licorice.

Where can I secure market for licorice root?—Subscriber, Westminster.

We would recommend our subscriber to write to the Braun Chemical Co., 906 East Third St., Los Angeles.

Pickling Olives.

Please give formula for pickling olives.—Mrs. F. M. D., Covina.

If subscriber will refer to our issue of September 15, 1910, she will find a tested formula given by Mrs. Sherman.

Loquat Tree.

To what height do loquat trees grow?—Subscriber.

Fifteen to thirty feet.

Legal Queries

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Trespass.

Has B the right to fence his property to exclude A's cattle if watering trough used by A is on B's land? Is A responsible for all damage caused by his cattle on B's land? If A's cattle have the right to water on B's land, have B's cattle the same right on A's land?—T. Igali, Oakland.

B has the right to fence his property so as to exclude A's cattle. A has the like right with reference to B's cattle. Where the parties fail to maintain a fence on their boundary line, each owner is bound to keep his cattle on his own property, and is liable for any trespass committed by the same.—E. L. P.

SWIFT'S

ARSENATE OF LEAD

For

Codling Moth, Canker Worm, Bud, Pear, and Cherry, and all leafeating pests.

Perfect Protection

One orchardist writes that after using Swift's Arsenate of Lead, he found but sixty-four apples affected by the codling moth out of 1141 boxes, or 1-200 of 1 per cent.

Does not scorch or burn no matter how strong it is used.

In 1 lb., 5 lb., 10 lb., 20 lb., 50 lb., and 100 lb. packages.

LET THE HART-PARR DO YOUR WORK

A Hart-Parr Tractor will do the work of 22 horses, and do it cheaper, better and quicker.

Establish a record this year in your farm work, by using economical power. Purchase a "Modern Farm Horse," and learn how to make more money with less work. You can do the work of 22 horses, and it will run a day and plow from 20 to 30 acres for about what it costs to feed ten horses.

There are thousands of successful farmers today who are using Hart-Parr Tractors to plow, seed, harvest, thresh and haul their crop. In fact you can do anything you can do with a big barn full of horses.

Let us tell you more about this "Modern Farm Horse," and its advantages on your farm. Mail us a postal card, and we will do the rest. We carry a full line of repairs that are guaranteed to fit. Two sizes, 15 Traction, 30 Brake, and 22 Traction, 45 Brake.

E. H. LEARNED R. F. D. No. 5, Los Angeles

Grower of Strawberry Plants only, and only the best.

General Agriculture

CROP ESSENTIALS.

The following has been gleaned from the address by Dr. Cyril G. Hopkins, of the University of Illinois, to a large audience of farmers at the State Institute in Edwardsville:

Three absolute essentials are of just as great importance for plants as animals—good breeding, good feeding and good care. In animal production each of these factors has, as a rule, received much consideration. But in crop production the average farmer does not give much attention to the selection of seed, and does not provide plant food for the crops. The farmer still practices every expedient known to man to get the fertility out of the soil without making any adequate return. But some Illinois farmers are already adopting permanent systems of farming under which the soil grows positively richer and permanently more productive. The cost of all the farm operations in growing the corn crop is just the same whether we grow forty bushels or eighty bushels to the acre.

The esesntials in a system of farming that will increase and permanently maintain the fertility and production of the common land of Illinois are phosphorus, organic matter and limestone. Half a ton per acre of finely ground natural rock phosphate every four years will be ample.

To Get Organic Matter and Nitrogen.

For a fifty-bushel crop of corn we must plow under the equivalent of eight tons of average farm manure, or two tons of clover hay, and whoever fails to do as much as that will finally have soil that will not produce fifty bushels of corn per acre. That is a plain, hard, agricultural fact. The nitrogen of our soil is contained only in the organic matter, which in our common soil consists of the partially decayed roots and residues of prairie grasses or other vegetation.

The grain and straw (or stalks) for one bushel of oats requires one pound of nitrogen; of corn, 1½ pounds; of wheat, 2 pounds; a ton of timothy hay requires 24 pounds. When the stalks or straw are burned, one-third of the nitrogen in the crop is lost. A ton of average manure contains 10 pounds of nitrogen; a ton of clover hay, 40 pounds; a ton of cowpea hay, 43 pounds. The roots and stubble of clover do not return to the soil any more nitrogen than the crop takes from the soil. Half the value of manure is lost, as a rule, if it is left exposed for three months.

Use enough limestone to correct the acidity, and about two tons per acre every four years to keep the soil sweet.

Where $1.50 Will Return $10.

The phosphate and limestone will cost about $1.50 per acre a year, delivered at almost any railroad station in Illinois. After this system is well under way the phosphate and limestone will add a ton per acre in the clover crop, 10 bushels of wheat and 20 bushels of corn, above the yields without limestone and phosphate. The proofs are shown by absolute chemical analysis and by the accurate results of hundreds of actual trials on many experiment fields. Thus, plots at the University which yielded 63 to 66 bushels per acre as a three-year average when broken from the sod in 1895, have as the average of the last three years yielded as follows: With catch crops and crop residue, 58 bushels per acre; with organic matter and limestone added, 64 bushels; with organic matter, limestone and phosphorus, 87 bushels; phosphorus plots have grown about one ton more clover per acre.

Mann Makes Practical Proof.

Hundreds of practical, progressive farmers in Illinois have been using phosphorus from one to five years. So far as I have learned, no man has given the use of phosphorus a fair trial and been disappointed in the result secured. Frank I. Mann, who farms 500 acres in Iroquois county, has already covered all of his fields with half a ton of rock phosphate per acre, excepting check strips, and part of the farm has received the second application. His result, showing large increase from the use of phosphate during several previous years, will be found in the institute report for 1909.

Good Results in Southern Illinois.

At Odin, Marion county, as an average of the last six years, limestone has increased the yield of wheat from 15 to 19 bushels, and both limestone and phosphorus have increased the yield from 15 to 27 bushels. Many thousand tons of ground limestone are being used each year by Southern Illinois farmers. There limestone is of first importance, but as soon as organic matter can be plowed under, phosphate should also be added; while on the corn belt soils phosphorus should first be applied, especially for the benefit of the clover crop, and on most of the older soils limestone also. But the organic matter of the soil must also be maintained by plowing under much clover and all produce except the grain, or by using all produce for feed and bedding, and returning all manure to the land with the least possible loss.

The Rotation of the Check Book.

For anyone to believe that crop rotation alone will maintain the fertility of the soil reveals gross ignorance of agricultural history and of absolute science; and for one to teach such a doctrine is a crime against posterity. Mathematics alone will show that the rotation of crops will no more maintain the fertility of the soil than the rotation of the check book among the members of the family will maintain the bank account. But someone will ask: Don't we get larger crops when we rotate? Certainly; and don't we also get more money out of the bank by rotating the check book? It is a fair comparison.

Production Not Holding Its Own.

The official statistics of the United States show that consumption has overtaken production. As an average of forty years we have scarcely maintained our yield per acre, in spite of the use of new lands and improvement in seed and in methods of cultivation; and we supported our increasing population only by increasing our acreage of cultivated land, and in late years we have also been compelled to decrease our exportation of foodstuffs in order to maintain a high standard of living.

Use Phosphorus Instead of Exporting.

The United States exports more than a million tons a year of our richest phosphate rock, receiving less than five million dollars at the mines. If this phosphorus were applied to our own Illinois lands, it would be worth to us and our children. not five million, but at least a thousand million dollars. If you had a 240-acre farm, upon which you and your children must depend, it would be altogether sensible, wise and businesslike to sell forty acres at $200 an acre and invest the money in 1,000 tons of phosphate, with which you could double the phosphorous content of the remaining 200 acres.

The Kind to Use.

Don't use burnt lime, which is very expensive and tends to burn out the organic matter of the soil and to destroy or waste the nitrogen; apply the natural limestone. When you apply phosphorus, don't use small amounts of manufactured, acidulated, high-priced commercial fertilizers, which serve as soil stimulants, and which have been used so extensively in the Eastern states in systems which led only toward ultimate land ruin; but use large amounts of steamed bone meal in emergencies, or, better, still larger amounts of fine ground natural rock phosphate, neither of which will ever injure any soil.

Let us have one state in the Union whose soil shall not be ruined, and whose children shall not be left with only a memory or tradition of the bountiful harvests of former years.—Hoard's Dairyman.

INVESTIGATION FOR GRASSHOPPER EGGS.

By S. Arthur Johnson, Colorado Agricultural College.

This is the proper time of year to investigate the fields in order to find the condition of grasshopper eggs. So far as the writer has observed, he has found that the eggs are rather locally distributed. When such is the case, the problem of their destruction is simplified and the cost of the operation much reduced.

From a great many localities reports have been received that the insects did not lay many eggs last fall. This may be true in many instances, but places have been found where there were many pods of eggs to the square foot. If these places are not thoroughly cleaned out, they will furnish infestation for the surrounding fields.

Grasshopper eggs are laid in pods, about an inch or an inch and a half long, just under the surface of the ground. A variety of situations are selected. Different kinds of hoppers appear to select different conditions. Some kinds lay in dry locations where the soil is firm, such as ditch banks, paths and knolls in the field. Others lay among the grass roots and about the stems of alfalfa, weeds and other plants.

The best way to hunt for eggs is to take a shovel and skim off the surface of the ground about an inch deep. This will generally cut the pods open so that they are easily seen. It will pay the farmer to spend a day or two going over his property. Pass along the fences and over the ditch banks, uncovering a square foot of earth every few feet or a rod. Look in all sorts of locations. Then cross the fields several times, in several directions, examining the ground all the way. By this means the infested spots can be found and cleaned out. If eggs appear to be generally distributed over a field, it will be well to plow or disc it one or more times in late fall or early spring, preferably both. Deep plowing will put the eggs so deeply under the ground that very few of the young will ever reach the surface, even if the eggs hatch. Discing and shallow plowing will tend to break up the pods and expose them to the weather and the ravages of birds so that they will be very largely destroyed.

The most difficult places to clean out are along the fences and ditch banks. A plow may be run as closely as possible on either side of the fence and the strip between grubbed out. This means considerable work, but the places where such careful work is needed are usually small and careful investigation will materially lessen the amount of labor.

CARE FOR THE GRINDSTONE.

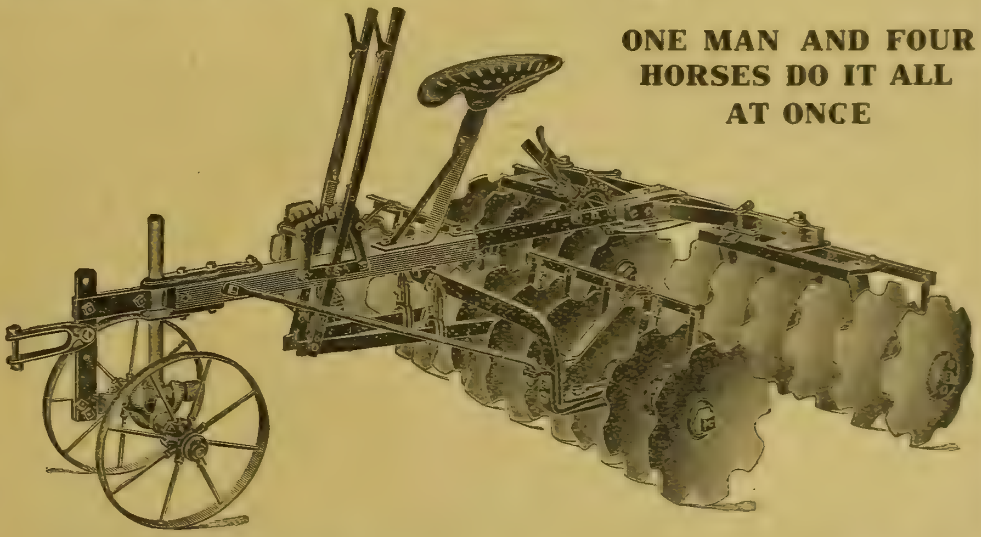
Although not a gem of purest ray serene, the one precious stone that is worth many thousands of dollars is universally neglected. Many boys early learn to despise it, but the grindstone is a most useful and necessary part of every country place equipment. Left under a tree, perhaps in shower and sun it is uncared for and unthought of except when needed. Then the user berates its hard spots and soft notches, its rickety frame and creaking bearings. "It's out of true and a nuisance, too."

Let the grit be sharp, not too fine, and the same on all sides. Let it be hung carefully and in a frame made for it, and have a trough prepared to set under it at once, so it will turn always in water. The stone should not stand in it. Three little things should always be at hand near the grindstone, an oiler for the bearings, an old file with which to turn it true, and a piece of common brick. When we are in a hurry and the stone apparently turns round and round under the scythes or knives as if its surface were greased, then is the time to hold on the brick for a minute. A Dutch farmer showed it to me. It will surprise you to see how soon the grit begins to take hold of the steel again. Some grindstones have no trough, and a drip is arranged to let water flow onto them. It is a poor makeshift at best. The flow is always too fast or slow, is clogged, or the can is empty, and as a result the grinding suffers, much time is wasted and the dirty water is thrown over the grinder or upon the floor.

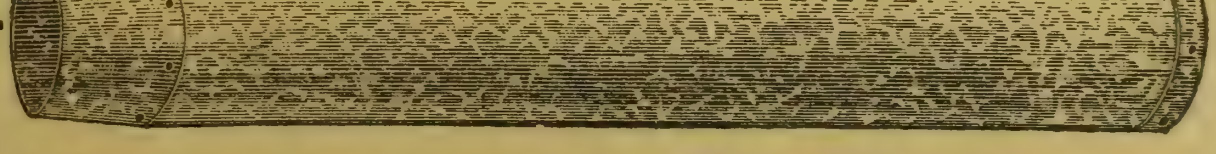
If grindstonces were maintained as respectable machines, well cared for and easy to turn they would not be dreaded and avoided, and many a piece of work would be done, better because of sharper tools. Anybody can make a treadle in a minute. The only things needed are a board three feet long and a piece of heavy wire. First, a loop is made in one end of the wire, this put through a hole in the board, or it may be put around the board and the other end of the wire fastened to the short crank of the grindstone shaft; just a loop that may be slipped off readily when required, and the thing is done.—New England Homestead.

I've squandered smiles today,
And, strange to say,
Although my frowns with care I've stowed away,
Tonight I'm poorer far in frowns than at the start;
While in my heart,
Wherein my treasures best I store,
I find my smiles increased by several score.

—John Kendrick Bangs.



ARNOTT DOUBLE DISC HARROW
A Plow—A Disc—A Pulverizer—A Smoothing Harrow all in one
The SENSATION of the Day
Compare it Point for Point With Any Disc Harrow Made
Double Gangs
Double Cut
Double Throw
Double Levers
ONE MAN AND FOUR HORSES DO IT ALL AT ONCE
The flexibility of the **Arnott "Double-Cut"** in contrast with the stiff action of other two-way harrows is what is making it so popular. This flexibility is possible because of our Universal Joint connecting the front and rear gangs. For lack of this feature other double harrows have a good deal of side draft and will not make a square turn without digging a great hole. This can't happen on the **Arnott.** Independent front and rear levers within easy reach of rider.
Complete description mailed upon application. Write for prices
ARNOTT & COMPANY, Inc., Southwestern Gen. Agts.
112-118 South Los Angeles Street, LOS ANGELES.
All sizes in stock for immediate shipment, 4 to 10 ft. cut inclusive.



AMERICAN SURFACE IRRIGATION PIPE
SAVES WATER, GRADING AND TIME
The only scientifically constructed ***Surface Irrigation Pipe*** on the market. No round seams to leak, retard the flow of the water, or weaken the pipe. Cheaper than flumes. Easily handled. ***Will last a lifetime. The correct way to irrigate alfalfa.*** We make Riveted Water Pipe and Tanks. ***Write for illustrated catalogue.***
AMERICAN STEEL PIPE & TANK COMPANY
349 Pacific Electric Building **Los Angeles, California**

Money Making Little Liners

In this department we will insert your advertisement under a classified head for 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for our many thousand readers.

LIVE STOCK.

For Sale—Registered Holstein Bulls; 1 to 2 years old. Some sired by Prince Juliana, brother of former world's record heifer, Juliana De Kol. Dam and granddam, A. R. O. cows. Three record-breakers in some of their pedigrees. M. E. Sherman, Minnewawa Vineyard, Fresno, Calif.

Fistula, Poll Evil, Quittor and all running sores cured permanently by a recent discovery of medical science. Write for particulars. Dr. Fred G. Matthews, Veterinary Bacteriologist, 1232 Central Ave., Los Angeles.

A few young White Hornless Swiss Saanen Grade Milch Goats for sale. Mrs. E. Banta, Calistoga, Cal.

Angora Cat—Splendid blue tom by Blue Boy out of imported Fluffy, $50.00. B. A. Stocker, San Luis Obispo, Cal.

Registered Shorthorn Bulls and Poland China Hogs for sale. Best breeding. P. H. Murphy, Perkins, Cal.

WANTED.

Wanted—Four or five hundred two or three-year-old seedling grape fruit trees, first class, grown from straight seedlings seeds (not budded seedlings seeds), three-quarters to one inch in diameter, 2½ to 3 feet high; must be growing in the nursery and never budded, clean and free from scales. State price. E. S. Lewis, Ontario, Cal.

Wanted—Your work pays the expense to learn a trade that pays $5 a day, in a few months' time; electricity, automobiles, plumbing, bricklaying; actual contract jobs; 200 students last year. United Trade School Contracting Company, 647 Pacific Electric Bldg., Los Angeles, Cal.

A Young, honest, industrious American, thorough High School education, willing worker, trusted anywhere, wants position on some large cattle or dairy ranch. Best of references. Address Box P, Cultivator.

Help Wanted—We want several good solicitors to solicit for a high class suburban monthly publication. Good profitable employment to the right party. For particulars address Box H, Cultivator Office, Los Angeles

Wanted—500 ft. of 7 or 8-in. galvanized irrigating pipe. Address J. T. Morgan, 619 W. 45th St., Los Angeles, Cal. Tel. South 292.

Wanted—From one to three thousand acres of land. Wm. Paramore, Hollywood, Cal.

TREES.

For Sale—About 3000 Washington Navels and 7000 Eureka and Lisbon Lemons, one year old, thrifty stock and free from scale. Nursery near Mentone. Address 428 Court St., San Bernardino, Cal.

Bonvalliets Giant, new Chicako variety, 2 years, $5.00 per 1,000; Palmetto, $4.00 per 1,000. Plant early. Deciduous fruit trees in dormant bud, $5.00 per 100; will pack light. D. Turner, Phoenix, Arizona.

For Sale—Gravenstein apple trees from 5c and up. We grow everything. One tree of best apple on earth, postpaid to any P. O. for 10c in stamps. The Cash Market, Sebastopol, Cal.

For Sale—250,000 first-class rooted vines, Zinfandel, Tokays, Muscats, Black Morocco, Black Ferrara, Cornichons, and Emperors in 1,000 lots at $11.00, smaller lots $1.50 per 100. Geo. McArthur, Acampo, Cal.

Ornamental Eucalyptus—Cleanest and best shade trees for the ranch. Acacias, pines, etc. Large stock. Ballou's Nursery, 728 East Orange Grove Ave., Pasadena, Cal.

Write for Special Price on peach trees and French prune trees, on Myrobolan root. Gridley Colony Nursery, Gridley, Cal.

Marsh Seedless Grapefruit—600 large trees for sale. E. S. Thacher, Nordhoff, Cal.

Black Walnut Selected Trees—One and two years old, 2 to 8 feet high. Also seedling peach trees, good stock, and Maliner Keen Horseradish sets. A. P. Henning, Clements, San Joaquin Co., Cal.

Eucalyptus—200,000 Rostrata and Tereticornis. Ready for fall delivery, 6 to 12 inches, $7.50 per thousand, F. O. B. Pomona. Logan Russell, Pomona, Cal.

For First-Class Valencia and Navel Orange trees and Eureka lemons, see A. G. Snow, Oxnard, Cal

Fine Line of Navels—Valencias and Eureka lemons for delivery spring of 1911. Contract now and get the first choice. The King Citrus Nurseries, Whittier, Cal.

NURSERY STOCK.

Having bought our seed of Luther Burbank, who guaranteed it selected seed, mostly from Giant Crimson Winter Rhubarb, we feel in shape to offer choice Crimson Winter Rhubarb plants for this year's planting at reasonable figures. Write for particulars. B. B. Currier, Sea Bright, Cal.

Rivera Nursery, L. L. Bequette, Prop.—Wholesale and retail dealers in Northern and semi-tropical trees, shrubs, roses, green house plants, etc. Have good stock of apples, peaches, etc. Send for descriptive price list. 625 S. Breed St., Los Angeles, Cal.

Our Descriptive Price List No. 2 contains all novelties exhibited at the Pasadena Flower Show, also other new introductions by Dr. Franceschi; mailed free on application. Montarioso Nursery, Box 1500, Santa Barbara, Cal.

Strawberry Plants—Fine ones. A No. 1. Dollar and Jessies $3.00 per 1,000. Special prices on larger orders, or to the trade. J. A. Powell, R. D. 1, Box 1, Ripon, Cal.

For Sale—Lawton Blackberry, Red Logan, Mammoth Blackberry plants, fine canners. $1.50 per 100. Also 5 acres of choice land close to cars, store, school, $1400, on easy terms. Frank Lima, Sebastopol, Cal.

Improved Superlative Red Raspberry Plants—Largest raspberry in cultivation. 100 plants, $5.00. Send for description. William Richard, 438 River St., Santa Cruz, Cal.

RARE PLANTS.

Wild Plant Improvement Gardens, Santa Ana, California. Newton B. Pierce, proprietor. Rare choice ornamentals and new fruits from all lands

Abuacates, Alligator Pears (Persea Gratissima). Fresh Mexican seeds, none better for stock; $4.50 per 100 seeds; $40.00 per 1000 seeds. Montarioso Nursery, Box 1500, Santa Barbara, Cal.

FARM LANDS FOR SALE.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station, climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

For Sale—155½-acre ranch in Owens Valley. 120 acres in cultivation, balance good pasture. 12 acres in 2-year-old Winesap apples. Work stock, farm implements, milk cows and 100 head hogs. Ranch 2½ miles from county seat. Mountain water, continuous flow, no assessments. A good opening for dairy or creamery. Address owner, Box 52, Independence, Inyo County, Cal.

For Sale—815 acres in San Luis Obispo County. A typical dairy ranch. Plenty of wood, water, irrigable land, buildings, fenced and cross fenced. Orchards, vineyards, oranges, lemons and walnuts do exceedingly well here. Forty acres of land suitable for these. Price $21 per acre. For further particulars apply to Mrs. F. A. Clink, Pozo, Cal.

For Sale—The Fresno Meadows Colony is now opened for settlement in lots of 40 acres or more with water at $50 per acre. This is an opening price and is made to induce settlement. Arrangements can be made so that the first payment will carry the deal indefinitely. Call or write at once. Green & Webb, Gen. Sales Agents, 406 Laughlin Bldg., Los Angeles. Phone A8284.

Tulare County—652 acres at $42.00 per acre. Good terms. One-third mile from switch and flag station, main line S. P., 2 miles from town and school. Over 600 acres of this, the very best, level alfalfa land. Unlimited pumping water at shallow depth, besides artesian water deeper. Electric power line near. Fine for subdivision. C. H. Biggin, Pixley, Cal.

For Sale—Ranches and country homes specialized. Exchange and market for this class of property. Accurate and reliable information always. Full particulars of beautiful and profitable home with acres. Parrish Barker, 207 Union Trust Bldg., Los Angeles.

60 Acres in Santa Clara County. A splendid dairy ranch. Good barns, dwelling and water supply. ¾ of it in excellent stand of alfalfa; close to railroad; one hour's run from San Francisco. Address 281 North Third St., San Jose, Cal.

Irrigated Land—The famous Gridley Colonies, Improved lands, best homeseekers' proposition in California. Write for particulars. Gridley Land Co., Gridley, Cal.

For Sale—El Cajon Grant Land. Virgin soil, 4 miles to railroad, good farm land at $30 to $60 per acre. S. B. Hawley, 1548 D St., San Diego, Cal

Cuba—Most productive soil. Delightful and healthful climate. Ample rainfall. Cheapest transportation facilities to the world's greatest markets. Particulars free. Sanderson, 13 Palace Building, Minneapolis.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal

MACHINERY

For Sale—A good portable drilling rig, good for 800 ft., complete string of tools. About half its value, at $750.00. Address M. H. Magie, 1242 Harvard Blvd., Los Angeles, Cal.

TURKEYS.

Thoroughbred Mammoth Bronze turkeys 8 mo. old, of large size and fine markings. Toms $8, hens $6. Can sell you toms and hens not related. Mrs. Nellie Hart, Holtville, Cal.

For Sale—Thoroughbred Mammoth Bronze turkey toms, spring hatch. Only a few left, all fine, large, well marked birds. Have two female Scotch Collie pups left, pedigreed stock. Mrs. A. C. Wisegarver, San Fernando, Cal.

For Sale—One thoroughbred bronze gobbler, 8 months old, 18 pounds, price $8.00. A. H. Burlingame, Westminster, Cal.

Bronze Turkeys for sale. Good stock at $3 to $4 each. L. Haynes, Madera, Cal.

HORTICULTURAL PRINTING.

The Kruckeberg Press, 123 South Los Angeles St., Los Angeles, Cal., makes a specialty of Horticultural Printing and Engraving. Cuts and illustrations of all standard, economic and ornamental plants on hand and subject to the use of patrons without cost. Samples and estimates cheerfully furnished. Remember, we design, write, engrave, bind and print; in brief, do the "whole thing," at no additional expense to the customer. Correspondence a pleasure

DAIRY SUPPLIES.

Have You a Cow?—Have you a creamery? Have you a cheese factory? Write us. Everything used in either a dairy, creamery, cheese factory, or for handling milk, cream, butter, or cheese. We are in a position to quote you prices on entire creamery or cheese-making outfits. We make a specialty of only the latest and best sanitary machinery and supplies. Send us a list of what you want and we will quote prices which we feel certain will interest you. O. J. Weber Co., 225-227 East Sixth St., Los Angeles, Cal.

Milk Coolers, Bottles, Caps, brushes, Buhl milk cans, Sharples separators, Babcock testers, veterinary instruments, wood soled boots and shoes, and our celebrated "Prosperity" washing powder. Guy F. Kelsey 108 E. 8th St., Los Angeles, Cal

FOR THE HOME.

Raisins—Recleaned, ready for use, Thompson Seedless Raisins, absolutely free from all stems and dirt. Cleaned by machinery. Housewives' delight. Better than candy for the children. Nature's own health food. Drop us postal for sample, or send $3.00 for 50-pound box. Fowler Fruit Co., Fowler, Cal.

Raisins—Producer to consumer, new crop loose Muscatels in 50-lb. boxes, 2 crown, 4c; 3 crown, 4½c; 4 crown, 5c; guaranteed. A. H. Dugdale, Etiwanda, Cal.

POULTRY.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal.

Hayes, R. B., Poultry Fancier and Rhode Island Red Specialist—30 breeding pens of Reds, 20 pens miscellaneous varieties. See our birds, they tell their own story, or write for circular. Eggs for sale only. Yards in Arroyo, opposite Ostrich Farm. Box 35, Garvanza Sta., Los Angeles, Cal. Phone East 1631.

LOVELL'S BLACK MINORCAS
California's
Greatest Egg Producers

Pedigreed, trapnested, scientifically bred Free circular. DAVID J. LOVELL, 5720 So Park Ave., Los Angeles, Cal.

Pacific Hatchery—Baby chicks, incubator eggs, and selected thoroughbred poultry, ranch raised. W. W. Clough, Ontario, Cal.

Orland Hatchery—Just hatched White Leghorn Chix. Booking orders for later delivery. P. L. Simpson, Box 13, Orland, Cal.

Baby Chicks and Eggs for Hatching—Orders now taken for January and later delivery of R. I. Reds (Tompkins Strain), White Minorcas and S. C. Black Minorcas (Northrup Strain). C. U. Chamberlin, Los Gatos, Cal.

INCUBATORS.

For Sale—Three 240-egg size, two 120-egg size. Machines all in good order. For particulars and price address X-Ray Ranch, Santa Rosa, Cal.

LAND FOR RENT.

For Rent—50-acre alfalfa ranch, good improvements, good location, $750.00 cash, $250 down and balance as hay is sold. H. F. Clark, 143 Chester Court, Hollywood. Phone Hollywood 2891.

MACHINERY.

For Sale—Second-hand windmills, tanks, engines, farm machinery that will do same work as new at half price. 140 ft. 2½-inch standard at 9½c; 10 ft. steel Star windmill, complete with tank and pump, $48; 12 ft. steel aermotor, steel tower, 6000 gal. tank, tank house, pump complete, outfit nearly brand-new for $115, cost $325. Small distillate tanks, 50 gallons up. Domestic and irrigating tanks, galvanized and 500 to 10,000 gallons, also 50,000-gallon tank, fine for storage. 5 fine stock tanks 8x3 ft. Steam engines with steam pumps; gasoline engines, 2 h. p. engine, pump jack, pipe, pump complete; also many other sizes. Gang, disc, road, riding, walking plows, feed rack, mower and rake, Fresno and slip scrapers, wagons, surrey, grading tools, sundries. Demmitt Co., upstairs, 120 N. Main, Los Angeles.

ENGINES.

For Sale Cheap—Avery thirty H. P. undermounted Oil Burning Steam Traction Engine. This engine is equipped with all approved time and labor-saving devices. It has been slightly used for experimental work only, and is warranted to be in first-class condition. Avery Cockshutt Plow—ten 14-inch steel bases, especially for this engine—will be sold cheap. It is brand new—has never been used. The Cockshutt Plow has won first prize at all international plowing contests for the last three years. Both engine and plow will be sold below factory cost, and we will be glad to mail you full description and prices. This is a real opportunity to buy a first-class outfit at big saving over the cost of inferior goods. Newell Mathews Company, 200 North Los Angeles St., Los Angeles, Cal.

For Sale—Recently secured 11 H. P. gas engine, now thoroughly overhauled. Want to sell before the first of year. Cash buyer can have this very cheap. Baillie & Brandt Co., 943-945 N. Main St., Los Angeles, Cal.

For Sale—25 H. P. Fairbanks-Morse distillate engine in first-class condition. Will guarantee for year. Machinery Exchange, Main & Bruno Sts., Los Angeles, Cal.

Business Notes

A FINE AUTOMOBILE.

The 1911 Moline shows a marked improvement in beauty of body, fenders, large 36-inch wheels, longer wheel base, in refinements both in outward appearance and interior construction, rather than radical changes.

The improvements offered in the Moline are: A long stroke motor, having a 4-inch bore and a 6-inch stroke. The wheel base has been increased to 112 inches, and the size of the wheels from 3½x34 to 3½x36. The new drop frame is another feature. This improvement adds materially to the grace and beauty. The double independent ignition system is another important improvement. The general enlarging of this season's model in the various features outlined above has naturally produced another very desirable change, that of a far more roomy, comfortable, luxurious and graceful body.

In the recent 1000-mile reliability run held in Chicago but three cars out of twenty-nine starters finished with perfect road and technical scores, two of these were Molines, thereby winning the team trophy and tying for the Van Sicklen cup.

Mr. William Gregory, agent for the Moline, is probably the only dealer in Los Angeles who has sold the same make of car for nine continuous seasons, having handled the Moline car since 1903.

YAQUI VALLEY.

Much attention is being attracted to the rich lands of Mexico, and sub-divisions are being made which offer opportunities for the pioneer. In the famous Yaqui Valley on the west coast of Mexico, 260 miles south of the American border, is an exceptionally fine offering of rich land. Bordering on the Gulf of California, it has certain vital advantages in soil, water, markets, transportation, and price of land. The water for irrigation is obtained from the Yaqui River and is conducted to the lands by thirty miles of canal and over 300 miles of lateral ditches.

This valley is producing some remarkably fine wheat, barley and oats. Forty-five bushels of wheat per acre have been harvested. But better than these products is the promise that cotton, onions, cantaloupes, watermelons, sugar cane, oranges and lemons, and practically all kinds of fruits and vegetables will do magnificently. We cannot give full particulars, but may mention that the lands are held at $25 per acre, including the water. Still better, the terms are made very easy. Fuller particulars may be had by addressing Chas. F. O'Brien, General Land Sales Agent, 112 W. Sixth St., Los Angeles.

Mr. H. P. Matthews, who is advertising gypsum, lime and manure in this issue, has a standard grade of material which cannot help but give results if intelligently applied. Mr. Matthews has traveled up and down the state and is known to many of our readers, who will be glad to extend to him their patronage. In recent years Mr. Matthews has been connected with the leading land plaster and gypsum houses on the coast, and being a soil and fertilizer chemist he is in position to give the very best of assistance in questions of fertilization. A letter to Mr. Matthews will bring information which will be of value.

One of the most interesting exhibits at the recent Thermal fair were perfect bunches of dates produced on the government experimental grounds at Mecca.

Household Department

HUMOR.

Laughter and Sadness, though opposite moods,
  Courted and married, a long time ago,
And from this union of antipode souls,
  Only one offspring, quaint Humor, can flow.

Laughter comes smiling, and opens the way,
  Sadness then follows, and drops in her part,
And this commingling of teardrops and smiles,
  Creates an urchin that captures the heart.

Tenderness beams from his sweet roguish eyes,
  Love sets her seal on his innocent brow,
And to his sceptre of health-giving fun,
  Savant and priest, and the laity bow.

Long may he flow from this God-given source,
  Mingling emotions of sadness and mirth,
Harmless in being, with tenderness rife,
  Offspring of innocence—salt of the earth!

—Farm and Ranch.

THE MAN OF MANY DEATHS.

Thus spoke the old captain:

"Yes, gentlemen—before God I swear it—on the twenty-eighth of February, 1871, of a Saturday, the last day of the siege of Paris, I stood, for the fourth and last time, face to face with a Prussian officer whom I had thrice seen die, under entirely different conditions."

We made no effort to conceal our doubt of this story.

"Here you have the story. We were in camp at Fort Mont Valerien; General Noel was in command, and no day passed without a skirmish with the enemy. A few days before the encounter at Bourget, while reconnoitering toward Longboyau, we heard in the woods the tramping of horse, and the rhythmic sound of cavalry on the march. At a sign to my men, we dropped flat in the shrubbery on the Bueil road, and waited.

"Presently, the enemy emerged from the wood, moving quietly, two abreast.

"At the side rode an officer, a tall, well-grown fellow with a blonde mustache and a handsome, proud face. I was considered a good shot in the regiment, and my men whispered:

" 'Now is your chance, Sergeant!'

"I closed my eyes involuntarily and fired. When I dared to look, I saw men and horses rising and falling in confusion, and many soldiers crashing through the woods at a gallop. The officer lay on the ground at full length. How immensely tall a dead man looks! I gazed at him long and attentively, not without a shudder, and I felt that never in all my life could I forget that face.

"A few days later I was on furlough in Paris, and I used the opportunity to ask after one of my friends, Lieutenant Legras, who had been wounded at Bondy, and who was in the hosiptal at Val-de Grace. During our chat, I noticed at a cot near us the vague whispering and meaning glances which tell of expected death. The doctor came, bent for a moment over the occupant of the cot, and signed to the two Sisters of Charity in attendance, who dropped on their knees in prayer.

"Legras whispered in my ear: 'A Prussian officer who is going to hand over his sword; he has been two days dying.' I looked toward the bed; at the same instant the sufferer raised himself partly up in a struggle for breath, and as he fell back dead, I began to tremble like a leaf, and the ashen pallor of my face startled Legras.

"It was the corn-blond German hero whom I had shot down on the Bueil road, who lay dead in the hospital cot.

"The answer to my inquiry was to the effect that the dead man was a Prussian captain who had been picked up gravely wounded on the field near Bondy, two days previously—therefore it could not be the same officer who a week before had fallen, pierced by my bullet.

"Day and night my excited brain sought in vain an explanation of this mystery, till the battle of Montretout turned my thoughts into a new channel.

"We were pushing toward the Chateau of Buzanval, when I picked out with my field-glass a group of Prussian staff-officers, among whom two figures stood out boldly, probably the leaders of the sortie. Suddenly on our left flank was revealed three squadrons of the enemy, dashing pell-mell upon us in a mad gallop. At the head of the enemy's attack was the undying dead officer of Longboyau and Val-de-Grace. Straight as a dart he bore down upon me, swinging aloft his gleaming saber. I fired upon him, and the next moment found myself rolling under my assailant's riderless horse. As soon as I could regain my feet, I sprang upon the body of the fallen Prussian, which lay near me, and (I confess freely what was perhaps an act of fiendish revenge) I plunged my bayonet deeply three times in the lifeless breast of the man who had become a hideous nightmare.

"He was surely dead now, was he not?

"Then came the days for the signing of our truce.

"I was on the outworks when the parliamentary signal was blown. A Prussian officer approached me, followed by a corporal. As the tall, stately figure drew nearer, it seemed as if every drop of blood in my body was turning to ice. The blue gleam of the eye, the gold-blond color of the long mustache, the whole expression of the face, at once forceful and dreamy. He it was again, my haunting vision, my three times fallen Germanic hero—the same whom only eight days before my bayonet had pierced through and through.

"Motionless, silent, I watched him, overwhelmed with the conviction that the Prussians could not die, as we died—but that they rose from the dead after each conflict, to fight us anew.

Noticing my gaze fixed upon him, the Prussian said, in a gentle voice:

" 'It is a mercy, sir, that this cruel conflict has come to an end. Your resistance was admirable, and very fatal to our side. As an individual I can speak feelingly; of four brothers of my family who fought before Paris, I am the only one to survive.' "—Universal Magazine.

The man who is willin' to give a good day's work fur a good day's pay is purty apt to allus hev a good day's work comin'.

Mayer SPECIAL MERIT SCHOOL SHOES

These shoes are built exceedingly strong. The leather is tough and the soles are selected from the best wear-resisting hides. They are the only school shoes made with two layers of leather over the tip.

"WEAR LIKE IRON"

GROWING OLD.

Your eyes may fail and your limbs grow weak, and the blood in your veins run cold; deep lines may furrow your sunken cheek, and your heart, that was strong and bold, may do its work with a feeble beat; the road may weary your stumbling feet; you may sigh for friends that you'll no more meet—but that isn't growing old. The years may number four score or more that over your head have rolled; you may hear the wash on the other shore of the waves that are dark and cold; while your brain is keen and your soul is strong and your heart is full of a hopeful song, you still are one of the youthful throng, and years will not make you old. When your voice is harsh and your words are mean, as you sit by the fire and scold, and your mind is fat and your heart is lean and your thoughts are blue with mold; when you bring to the breasts of the children fears, and bring to the eyes of women tears, it is not needful to count your years—we know you are growing old.—Walt Mason, in The Grange.

TO SWEETEN THE BREATH.

A bad breath is inexcusable. A number of conditions, which I will consider can give a bad breath but in the first place I would say that no one should breathe into another's face so that the condition of the breath is made known. It is entirely unnecessay to do so. The breath is something that should never be given or taken. Children should be taught this as soon as they can understand anything. When close to another in conversation turn the head a little one side, or stand back so that the current of air coming from the mouth will not strike the face. A little practice will show how easily this can be accomplished. In the next place, you can tell for yourself whether your breath is sweet or not by sending it up toward the nose so that you can smell it. The most common cause for a bad breath is indigestion, especially a nervous indigestion. The food remains in the stomach without being digested, and decays, giving rise to noxious vapors, which make a malodorous breath. Constipation is another great cause of bad breath, and should be corrected either by a laxative diet and eating fruit or by the use of some aperient. A fourth of a teaspoonful of bicarbonate of soda, taken in a half glassful of water before each meal, will help correct the kind of indigestion that gives a bad breath. The bicarbonate of soda granules, that you can obtain at any druggist's, are good for this purpose, and are excellent for the teeth, as they dissolve in the mouth. Charcoal tablets are also good, one taken after meals, in the same way.

The condition of the teeth and mouth will give rise to a foul breath. Cheese-like substances gather in the tonsils, caused by the over-secretion of the glands of which they are composed; they decay and give a bad odor to the breath. These deposits can be seen when you examine the tonsils with a hand-glass, and they can be pressed out by means of a toothpick, the point of which should not be too sharp. They can also be removed by the use of an antiseptic gargle for the throat. For the teeth to give a bad odor to the mouth they must be in a very advanced state of decay, or must indeed by very badly neglected. The breath is rendered very offensive by certain edibles, notably cheese and onions. The combination of beer and

cheese is one that will make all but the partaker suffer, when in close proximity to him or her. It is a pity that onions make such a disagreeable condition of the breath, as they are very healthful if thoroughly cooked. Sometimes the use of pastiles or charcoal tablets will sweeten the breath so that the odor will not be perceived.

The breath may be rendered foul by the condition of the nose, occasioned by catarrh, which should be corrected. If the inflammation of the nose has continued for a long time, so that it attacks the bones, the odor is one of the most penetrating and nauseating imaginable. Since the more general use of antiseptic sprays this odor is not so often met with, as by the use of these it can be kept down. The saturated solution of boric acid is excellent for those troubles of the mouth and nose. One should have a good spray and spray the nose, mouth and throat thoroughly night and morning, as much as one would brush the teeth. The Ladies' World.

SOME MEASUREMENTS.

A young housekeeper who was poring over the pages of a cook book asked earnestly: "Is it my fault or the book's that I fail in cooking certain things?"

Upon the first page, in black-faced type, under the head of general directions, was the following: "Use two rounded teaspoonfuls of baking powder to every quart of flour." Upon the very next page, under another heading, appeared these words: "The general rule of proportion is two heaping teaspoonfuls of baking powder to every quart of flour."

The preparation of a dish is a chemical experiment, and to get perfect results, definite proportions must be used. The chemist is accurate to the drop or the grain. The cook should be equally careful.

If the rounding and the heaping teaspoonful were measured accurately, they would make, respectively, two and four level teasponfuls. But not one person in a hundred would be able to measure them accurately. That being true, why not do away with all guesswork and adopt a basis of measurement which will be the same every time and in the hands of every person?

The level measurement at once suggests itself. To measure a spoonful of dry material, such as flour, dip in the spoon, lift it heaping, and level with the side of the knife, the cutting edge of knife moving toward tip of spoon. The half spoonful is measured by dividing the level spoonful in half, lengthwise. For the fourth, cut the half crosswise. In measuring by the cup it is not sufficient that the same cup be used for measuring everything; if a large coffee cup is used for measuring flour when following a recipe, the result is apt to be too much flour for the given amount of leavening (baking powder) and shortening. The use of a teacup would give too little flour in proportion to the other ingredients. The standard measuring cup, containing one-half pint, should be the only cup used. It is marked off in halves, thirds and quarters, and can be had in tin or glass. The cost is nominal—five cents at the most.

Instead of measuring a third or fourth of a cup, it will often be easier and quicker to use a tablespoon.

Table of Measures.

3 teaspoonsful equals 1 tablespoonful.
16 tablespoonfuls equals 1 cupful.
8 tablespoonfuls equals ½ cupful.
4 tablespoonfuls equals ¼ cupful.
1 wineglassful equals ¼ cupful.
1 gill equals ½ cupful.
1 cupful equals ½ pint.
2 cupfuls equals 1 pint.

Equivalent Measures and Weights.

4 cupfuls flour equals 1 pound.
2 cupfuls granulated sugar equals 1 pound.
2⅔ cupfuls powdered sugar equals 1 pound.
2⅔ cupfuls brown sugar equals 1 pound.
4⅓ cupfuls coffee equals 1 pound.
2 cupfuls butter equals 1 pound.
2 cupfuls chopped meat (packed) equals 1 pound.
1 square Baker's chocolate equals 1 pound.
2 tablespoonfuls butter equals 1 ounce.
2 tablespoonfuls sugar equals 1 ounce.
4 tablespoonfuls flour equals 1 ounce.
⅓ cupful chopped nuts equals 1 ounce.

PINEAPPLE PUDDINGS.

Almost any of the excellent puddings usually made with apples can be made with pineapple with very decided gain in flavor as well as in novelty. The desert, which made with apples is ordinary and commonplace, may be transformed into an unusual and more elegant dish by simply substituting pineapple.

Pineapple "Brown Betty"

Fill a baking dish with alternate layers of buttered bread sprinkled with sugar and grated pineapple, letting the top layer be of the bread with an extra spreading of butter. Cover with a plate and bake in a slow oven, adding a little water if it seems to dry out. Remove the plate, brown the top and serve with "fairy butter," which is nothing but butter and powdered sugar beaten together until they foam. In cool weather a very little boiling water is necessary to make the fairy butter.

Pineapple Biscuit Pudding.

Butter individual baking cups and drop into each a large spoonful of grated or crushed pineapple. On this place a tablespoonful of soft biscuit crust, leaving plenty of room for the dough to rise in steaming. Cover the cups closely and steam in a kettle of water for about an hour. Turn out on plates and serve with any preferred sauce.

Pineapple Sponge Pudding

Cover the bottom of a buttered baking dish with a layer of crushed or grated pineapple and pour over it a sponge cake batter made by any recipe which has proved reliable. Bake until the batter leaves a broom straw clean. Serve with or without a sauce. It is good enough without.

HOW "THON" WOULD WORK.

"Thon" is the word which has been suggested for use as an English pronoun of common gender, a luxury which the English languauge has thus far had the fortitude to forego. It was considered suitable for English because it came from the Greek. Its use may be illustrated as follows:

If a parent desires to spank thon's (his or her, as the case may be) child, thon (he or she) should take thon (him, her or it) across thon's knee. Then thon should remove thon's slipper, and after explaining to the child the reprehensibility of thon's conduct, thon should apply the slipper to that portion of thon's anatomy which from time immemorial has been dedicated to that purpose.

It may easily be seen from the above how "thon" effects great clarification. —Lippincott's.

Scott, Magner & Miller say:

Receipts of hay on the San Francisco market for the week ending today have been 1,750 tons. This amount is largely below our normal consumption, and about one-half of what usually comes in at this period of the season during the same length of time.

There has been no alfalfa hay coming into the market recently, and the city stocks are being drawn on to fill current trade requirements. The feeling on this article is firmer, although not definitely or quotably higher.

There has practically been no straw coming in at all lately, as there has been no demand for this article.

We quote the wholesale prices in round lots on today's market as follows:

Fancy wheat	12.50@13.50
No. 1 wheat or wh and oat	10.50@11.50
No. 2 wheat or wh and oat	9.00@10.00
Choice tame oat	10.50@11.50
Other tame oat	8.00@9.50
Wild oat	8.00@9.00
Stock hay	5.50@6.50
Alfalfa, ton	9.00@11.00
Straw	40@50

Grain.

Wheat, No. 1	1.42½@1.50
Barley, fancy	1.07½@1.08¾
Barley, good to choice	1.03¾@1.06¼
Barley, poor to fair	97½@1.02½
Oats, white	1.45@1.55
Rye, new crop	1.50@1.55
Alfalfa seed	18@20
Mustard, brown	4½
Millet	2¾
Flaxseed	5@5½
Broom corn seed, ton	23.50

Mixed feed, ton	25.00@27.00
Shorts	31.00@32.50

Citrus Market

LOS ANGELES, Dec. 14, 1910.

Notwithstanding exceptionally heavy shipments, the fruit which has gone forward has been taken at fair prices. The market is exceptionally strong, and the promise is that all holiday offerings will be picked up at very satisfactory prices. In view of the exceedingly large output, this is very gratifying, and it is probable the shipments during the holidays will not shrink as they have in past years. This is due largely to the ripeness of the fruit.

Lemons are meeting with a better demand. This is caused in part by the lower price which has prevailed and the exceptionally high quality of raw fruit offered.

Shipments.

Total shipments of oranges since November 1 to date, 1,676 cars; of lemons, 561; making a total of citrus fruits for the season of 2,237 cars.

NEW YORK, Monday, Dec. 12.—Eleven cars navels, four cars lemons. Market strong on navels, lower on lemons. Fair seasonable weather.

STATE CREAMERY OPERATORS.

The California Creamery Operators Association met in its eleventh annual session in the city of Los Angeles last week. Creamery operators from all portions of the state and experts in creamery work were present. President C. C. Ridgway of Porterville presided. The visitors were welcomed to the city of Los Angeles and response was made by President Roesell of the San Francisco Dairy Exchange.

President Ridgway's annual address touched upon the growth of the association and the better conditions in the creamery business effected by the organization. He said, "We stand for the enactment of just laws in our business and the progress of the creamery business owes its greatest advance to the work of this association during the past eleven years." Rev. A. C. Smither of Los Angeles addressed the convention on the subject of the weight of butter and made a very touching appeal for fair weight, which was received with much pleasure by the delegates. Prof. Hopper of the State University, C. L. Mitchell, F. W. Andreason, Secretary of the State Dairy Bureau, and others made addresses. Trolley rides, theater parties, a banquet, and other features added to the pleasure of the convention.

A CHRISTMAS SUGGESTION

THE CULTIVATOR annual offer of subscriptions for Christmas presents is now in order. What can be more appreciated, in proportion to its cost, than a year's subscription to our paper?

Other presents can not be the constant reminder of the giver that the Cultivator would be on its weekly visits.

In each case where our paper is intended as a Christmas gift we send, with the first number, an announcement of the gift showing the name of the giver. No present can be arranged for so simply and satisfactorily for all concerned. Merely enclose check or money order with order blank which may be found on another page of this issue, and we will do the rest.

As is stated on the order blank all Christmas or gift subscriptions are discontinued at expiration. This date is usually January 1, though we arrange to have the first copy reach the reader as near Christmas day as possible. Now is the time to send orders.

VETERINARY

Answers in this column by Dr. Fred G. Matthews, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Spleen and Kidney Trouble.

I have a mare 18 or 20 years old. She has been ailing some time and I gave her a quart of raw linseed oil and called in a veterinarian who left a course of medicine for the spleen and kidneys, which has benefited her, but she does not pass as much water as she should. I feed good oat hay, bran and barley. Kindly prescribe for the spleen and kidneys and oblige—Subscriber, Pasadena.

Have this animal's teeth examined and, if necessary, treated by a qualified veterinarian. Include a liberal allowance of alfalfa meal with the grain ration, and twice daily mix into the feed one tablespoonful of powder made of gentian root, 2 ounces, nux vomica 1 ounce, resin 2 ounces, and dried sulphate of soda 7 ounces.—F. G. M.

Scours.

A four-year-old Jersey cow turned from dry feed to clover developed scours which has persisted about three months. Several remedies have been tried with no good result. She has a light cough. Is running on oat stubble pasture with good many green oats in it.—Subscriber, Twin Falls, Idaho.

Remove the cow from the green pasture and feed dry food of good quality. Purge with one pound of epsom salts and one-fourth pound of table salt dissolved in two quarts of water as a drench. If improvement does not follow have your druggist secure Merck's Tannoform and give the cow 2 drachms three or four times daily. The cough will probably disappear when the indigestion is relieved.—F. G. M.

Worms.

What is a good thing to give horses for worms?—Subscriber, San Dimas, Cal.

Starve the horse 12 to 18 hours and give two ounces of turpentine in a pint of oil and follow with two drachm doses of a mixture of equal parts of dried sulphate of iron and powdered gentian root, twice daily, in the feed, for a period of ten days. Discontinue treatment one week and repeat if considered necessary.—F. G. M.

AUCTION
170 Fine Dairy Cows 170
Thursday, Dec. 29, at 10 a.m.
. . . AT THE . . .
Santa Ana Jersey Farm

☞Take electric cars to Artesia street, Santa Ana, walk one-quarter mile south to Ranch **SANTA ANA,** property of the Santa Ana Jersey Farm.

This herd consists of 170 head of the finest dairy cows in California, mostly high-grade Jerseys. A few thoroughbreds and registered, also a few fine Holsteins. All young and in the pink of condition, many fresh, others coming in soon. All large, fine cows, large milkers; average test of entire herd better than 5 per cent. Prospective customers are requested to visit the ranch any day prior and see these cows milked at 3 a. m. or 3 p. m.

Twenty-five head of brood sows and pigs.
Fifteen head all purpose horses and mares.
Five dozen chickens.
New milk wagons, harness, implements, household goods, etc.
This is without doubt the finest dairy herd in California.
If you are in the market for strictly first-class dairy stock, do not miss this sale.
TERMS: One-third cash, balance four and eight months' time, with bankable note at 8 per cent interest; 3 per cent discount for cash.
Old-fashioned Spanish barbecue at noon.
It will pay any dairyman in the state to attend this sale and see one of the finest herds and best equipped dairy ranches in the West.
Routes have been sold, and owners are positively closing out entire herd and retiring from business. Sale takes place rain or shine.

☞See future ads or inquire of auctioneers for full particulars.

Los Angeles December 22, 1910 San Francisco

A LUXURIANT REGION OF GARDEN, FIELD AND ORCHARD CROPS

CHERRY PACKING IN SAN JOAQUIN COUNTY. Courtesy Stockton C. of C.

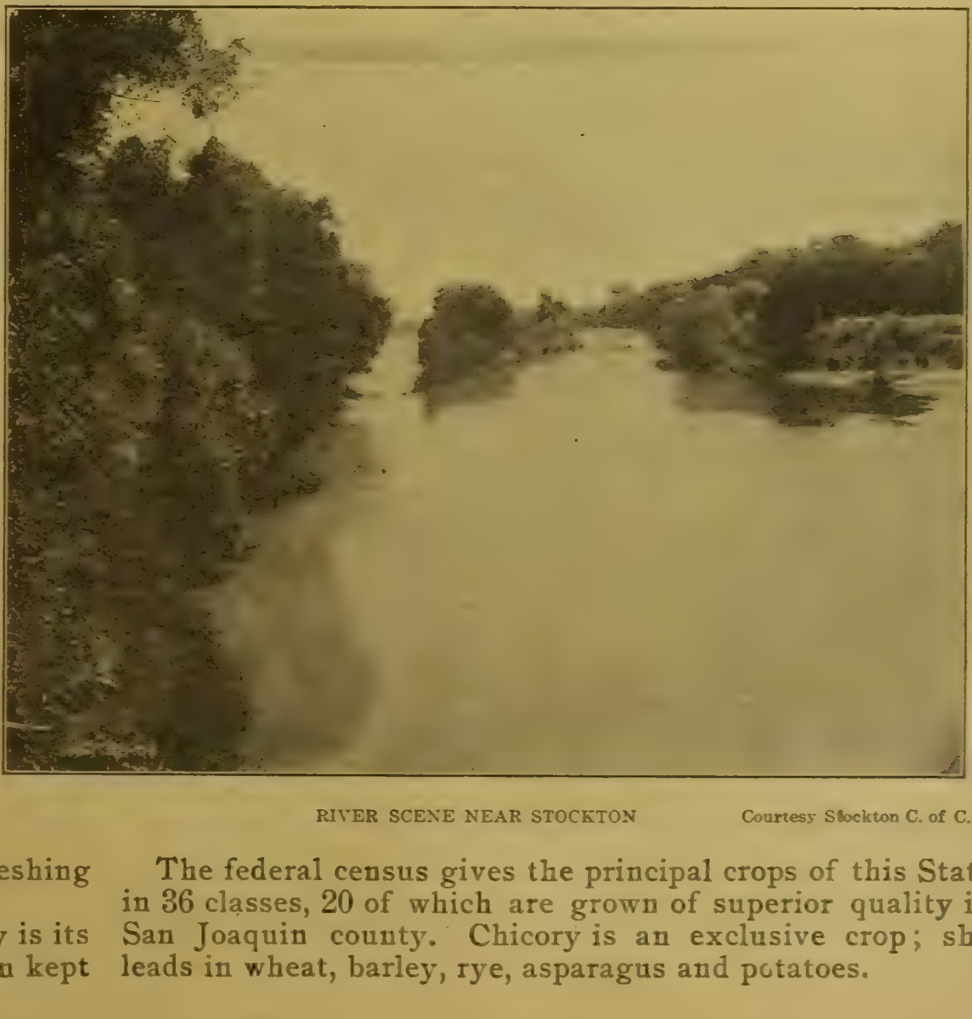
One of the very best watered regions and richest counties in California is located in the geographical center of the State, and its principal city has been called The Gateway, because of its commanding situation. This principal city is Stockton, and the county is San Joaquin. West of the city of Stockton are the rich deltas of the San Joaquin and Sacramento rivers, once considered worthless, but now (through the construction of levees and cultivation) more productive than the lands of the Nile or those of the Netherlands. Asparagus, celery, potatoes, and all the garden crops demanding intensive cultivation, produce marvelously while the work of reclamation is still being rapidly pushed. East and north of the city are the higher lands, at one time among the richest grain fields of the State, now given over to fruit growing. The table grape vineyards of Lodi and Acampo have sent out their hundreds of cars of Tokays, thus increasing California's reputation as a fruit producer.

As to its climate, one writer has said: "Lying between two ranges of mountains that gather and store the sun's rays and shut out the cold winds, the valley is warmed to that degree of rich productiveness so necessary to bring the blush, the flavor and the sweetness to our fruits. At night, however, the valley is cooled by the fresh, western breeze that sets in from the ocean and blows through a pass in the mountains, so that undisturbed, refreshing slumber follows the day's work out of doors."

One of the attractive feature of San Joaquin county is its system of good roads, a campaign for which has been kept up for many years. In addition to actual road construction its people have given attention to ornamentation. Arbor Day is generally observed every spring, when nearly the whole population turns out to beautify the roadsides. Stores are closed, and it is made a general gala day with picnics and play, in addition to the work of tree and shrub planting.

The rainfall averages 14.54 inches for the season, and the inexhaustible nature of the soil made it so easy to raise grain year after year, that grain farming long was, and still is, the predominating industry of the county. But many are finding it more profitable to cut their large holdings into small tracts, which are being devoted to orchard and vineyard, garden and dairy products. Even without the use of water, lands devoted to sugar beets yield handsomely, deciduous fruits, grapes and nuts also find congenial conditions.

The river scene taken on the banks of the Mokelumne gives but a faint idea of the riches obtainable through irrigation in that county. The two principal streams are the San Joaquin and Mokelumne. The former not only gives of its waters for irrigatian, but also affords water transportation between Stockton and San Francisco. San Joaquin is a rich county that promises still greater development within the next few years.



RIVER SCENE NEAR STOCKTON Courtesy Stockton C. of C.

The federal census gives the principal crops of this State in 36 classes, 20 of which are grown of superior quality in San Joaquin county. Chicory is an exclusive crop; she leads in wheat, barley, rye, asparagus and potatoes.

ARNOTT DOUBLE DISC HARROW

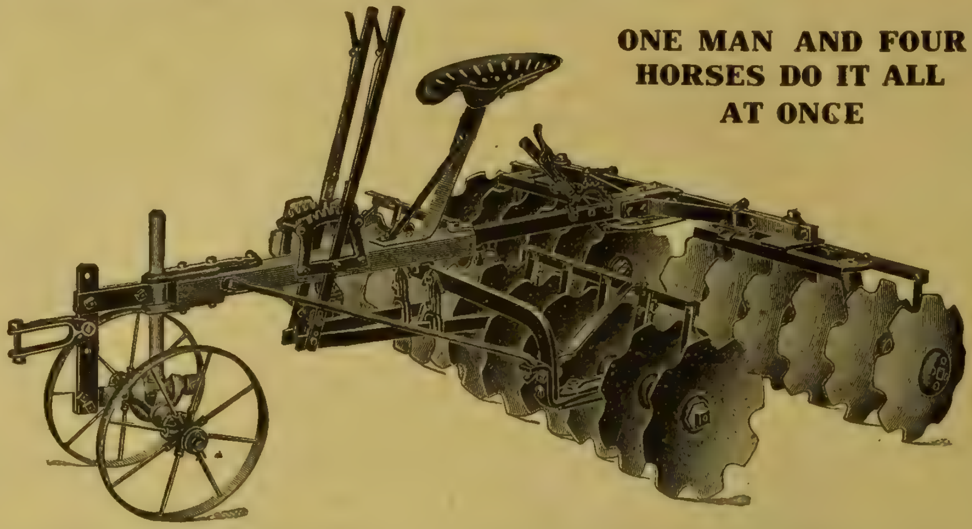
A Plow—A Disc—A Pulverizer—A Smoothing Harrow all in one

The SENSATION of the Day

Compare it Point for Point With Any Disc Harrow Made

Double Gangs
Double Cut
Double Throw
Double Levers

ONE MAN AND FOUR HORSES DO IT ALL AT ONCE



The flexibility of the **Arnott "Double-Cut"** in contrast with the stiff action of other two-way harrows is what is making it so popular. This flexibility is possible because of our Universal Joint connecting the front and rear gangs. For lack of this feature other double harrows have a good deal of side draft and will not make a square turn without digging a great hole. This can't happen on the **Arnott.** Independent front and rear levers within easy reach of rider.

Complete description mailed upon application. Write for prices

Is Asiatic Labor Essential to California's Welfare?

By John T. Bramhall, East Auburn, California, who Thinks Highest and Longest Continued Prosperity will be Secured by Keeping "California for Americans."

The San Jose scale came, we are told, from China. It threatened the citrus orchards of America with ruin, and has been held in check—not eradicated—by the utmost vigilance and at immense expense. But that only menaced the orchards; what if a worse peril is threatened, a peril that throws a dark shadow over the orchardists themselves and forbodes a ruin to them and all agriculturists as dire a that which threatened the orange groves?

To prophesy evil is indeed a most unwelcome task, but when one sees a rock on the track or a break in the reservoir there is but one course open, to sound the alarm. In reading an account of the labor troubles, or I should rather say the race peril, in South Africa, I came across a striking parallel. It appears that in 1859 the land owners of Natal petitioned the governor, Sir George Grey, to be allowed to import Asiatic labor. The corporation (city) of Durban supported the appeal in an address in which they used the following language:

"Independently of measures for developing the labor of our own natives, we believe your Excellency will find occasion to sanction the introduction of a limited number of coolie or other laborers from the East in aid of the new enterprises on the coast lands, to the success of which sufficient and reliable labor is absolutely essential; for the fact cannot be too strongly borne in mind that on the success or failure of these rising enterprises depends the advancement of the colony or its certain and rapid decline. Experimental cultivation has abundantly demonstrated that the issue depends solely on a constant supply of labor."

Some time ago was made the report of Labor Commissioner Mackenzie on the investigation of the Japanese in California, under special act of the legislature (intending to strengthen the hands of the governor in maintaining California's anti-Japanese policy before the president and congress), which finds:

"That the perpetuity or continued development of these great and highly specialized forms of agricultural activity must largely depend upon a supply of labor coming from without the United States, and of such a nature and character as to conform to the condition resulting from the application of that labor to the agricultural demands."

And also, as regards the supply of white labor:

"That the creation of an ideal, intelligent class of white farm labor to be drawn from all sources within the confines of the United States is practically an impossibility for the reason that such an effort would entail an entire and radical readjustment of economic conditions, etc."

It is but natural that the employers, whose opinions are thus stated by the labor commissioner, should be unable to see any side to the question but their own, nor can they be expected to be informed regarding the experience of people in another hemisphere, who, laboring under conditions very similar to their town, have made a like effort for relief. They will be interested, doubtless, in learning the nature of this experience. I find this related by Mr. L. E. Neame, of Johannesburg, South Africa, in a recent number of the Annuals of the American Academy of Political and Social Science. The "limited number of coolie and other laborers from the East" has swelled into an Indian population greater than the entire population of Natal. The Asiatics called in to help the "enterprises on the coast lands" have spread all over the uplands, which ought to support a large white population. Instead of tne "specialized agricultural industries" alone, such as the tea and sugar plantations, it is the farmers, the manufacturers, the wealthier residents of town and country alike, says Mr. Neame, who are demanding Asiatic labor. And what is the result? "Today the adult male Indians in Natal outnumber the adult male Europeans by ten thousand. Indian shops are found in the best streets of Durban, and in some of the small towns hardly a white man's store is left. The 'limited number' of coolies now own thousands of acres of land. They are the fruit and vegetable growers of the colony. "A member of the Natal legislature wrote some time ago:

"Indians both rent land and hold it freehold, and their holdings of both classes are extending year by year. Large areas of the coast country of Victoria, north of Durban, have of late years been acquired by syndicates of Europeans and retailed acre by acre to these people, who are keen to buy and are willing to pay prices which no European could afford for occupation and cultivation. As a matter of fact, in this Garden county of the Garden colony, the European population cultivating the soil is probably smaller in number than it was thirty years ago, while the Indian is gradually taking up the land upon which were reared in those days families of Europeans—colonists of the best stamp. What will be the outcome is causing anxious thought to many in Natal, who look beyond the present day and its present profit."

Now let us look at Cape Colony. Following the recent period of depression, in the five largest towns in the colony, as we learn from the same authority, Cape Town, East London, King William's Town, Kimberly and Port Elizabeth, the number of general dealers' licenses issued to Europeans in 1906 fell off 25 per cent from the previous year, while the licenses to non-Europeans increased 4.6 per cent. Or to put it more directly, thirteen hundred Europeans were forced out of business, and forty-four Indians and Chinese admitted!

And do we say that we will look out for that, that we will admit only "a limited number?" What is our experience already? Does not Mr. Mackenzie's report tell us that he found 10,791 acres in this state under Japanese ownership by recorded deed, and that, though only a small proportion of the leases are recorded he found the "actual lease holdings" in the state to be 115,000 acres? In commercial pursuits, the investigators visited 2,548 establishments run by Japanese, but what proportion of the whole number in the state that may be we are not informed, nor do we know what proportion the $4,000,000 he finds invested bears to the whole Japanese capital in business in California. We are told, however, that these establishments did a business of over $16,000,000, 36.8 per cent of which was with white people. In the conduct of the business, 5,556 persons were engaged, of whom there were 35 male and 20 female white persons. (Mark this latter item.) The figures, be it remembered, are incomplete, as they do not embrace the whole number of Japanese establishments. It is also worth noting that on the 1,733 Japanese farms visited, "96 per cent of the labor employed was Japanese, while 872, or 4 per cent, was equally divided between male and female white." from which the commissioner of labor proceeds to deduce some information regarding the proportion of the $28,000,000 worth of crops which was raise by the Japanese. By the same token we may calculate that $1,120,000 worth of produce, at least, was raised for the Japanese by the labor of these 436 white women. But figures and percentages founded upon the report are wholly valueless, sin there is no definite basis to go upon. We only know that there were so many, and so much, of this or that, plus—. I will only pause to suggest that it must be very distasteful to our California ranchers, whether of specialized industries or not, to learn that besides the white girls employed in the Japanese stores there are several hundred white women employed on the Japanese farms. And still we have not Asiatics enough!

Let me present three pictures. First, in the Monterey district. When the Japanese arrived in the Pajaro valley they were welcomed by the merchants; today the merchants bitterly complain that the Japanese have become close competitors. They run barbershops, restaurants and ready-made clothing stores in the city of Watsonville and operate busses and delivery wagons in the adjacent territory. One bank positively refuses to open an account with the Japanese because of their absolute dishonesty.

Next, the Vaca valley. The Japanese came to this valley, in Sonoma county about twenty years ago, and began working for small wages. Their number increased until they not only displaced about all the white labor but the Chinese also. Then they began to rent orchards, outbidding the Chinaman until he ceased to be a factor. Now the "Japs" control more than half the fruit farms of the valley. Prior to the advent of the Japanese, Vaca valley was renowned for its orchards, which attracted wide attention on account of the superior methods of pruning and cultivating. Today there can be no boasting in this respect, for the orchards, like most of those cultivated by the Japanese, are run down and neglected. In Vacaville, the Japanese stores are doing the bulk of the local and nearly all the farm supply business.

Fresno, from its commanding situation, should be one of the most prosperous cities of California. It is in the center of the most productive raisin district of the state, yet in recent years its vineyard acreage has not increased and bank deposits have increased less than 20 per cent in the past six years. Here as in nearly all the fruit centers of the state the Japanese have gained a foothold, and the region has suffered in consequence. He is merciless when he has his employer at a disadvantage; he works cheaply until all competition is eliminated, and then strikes for higher wages. The next step is to supplant the white owner, either by lease or purchase. "The general persistency with which the Japanese are entering many industries," says a Fresno correspondent, "their frugality, their ambition and their lack of business morality, render them more formidable than the Chinese." These pictures could be duplicated from the deciduous fruit region, and from every district into which the Japanese have entered.

But let us say no more about the Japanese. Indeed, I have used the above illustrations, which I have drawn mainly from the report of the bureau of labor statistics for 1905-6, only to emphasize the general statement that the presence of the Asiatic is detrimental to the interests of the Caucasion. Neither the Japanese nor the Chinese need be considered as a

(Continued on Page 634.)

LARGEST CITRUS NURSERIES IN THE WORLD

Parties contemplating the planting of citrus groves this coming spring will do well to send for our prices soon, as there will evidently be a shortage of strictly first class stock. Write today for particulars, or, better still, pay us a visit so that we may be able to show you just what we have.

Our finely illustrated booklet, ''Citrus Fruits,'' covering the industry from the seed to the market, mailed to any address on receipt of 25c in stamps.

Citrus and Tropical Fruits

ORCHARD HEATING IN COLORADO.

It is practically impossible to estimate the average damage to fruit from late spring frost, but a conservative estimate of the average annual loss to fruit growers in the United States from this cause would be at least 50 per cent. of the possible crop. It is probable that the percentage of annual loss is even greater than 50 per cent., but assuming that half of the possible crop each year is destroyed at its inception by frosts, when it is stated that a method has been discovered whereby the greater part, if not all, of this loss can be avoided, every fruit grower is interested.

The recent experiments in orchard heating in the Grand Valley, Colorado, have apparently demonstrated beyond doubt that it is possible to maintain a safe temperature in orchards when the natural temperature is at 20 degrees above zero or even lower. As a result of the experiment in the Grand Valley, a crop of fruit valued at $2,000,000 was saved and marketed when the records show that temperatures at various places in the valley were as low as 19 and 20 degrees above zero.

About 70 per cent. of the orchards of the valley were heated during the danger period of 1909, and without exception these orchards had crops where those in the danger zone lost all of their crop. The experiments went so far that trees protected by the heat on one side and unprotected on the other, bore fruit on the protected side and none on the other. While there are still many details to be worked out, results thus far attained justify the assertion that it is possible to protect the fruit crop from the early and late spring frosts by applying artificial heat.

During the years of development of the Grand Valley fruit industry, killing frosts late in the spring were unknown, and losses from this cause were apparently very light until about three years ago, when practically the whole crop was lost by a late frost in the spring. This calamity awakened the growers to the fact that the late frosts were possible even in the favored Grand Valley, and they began to look for remedies. Very naturally, smudging was the first resorted to and some of the growers went to California to investigate the smudging done there. During the winter of 1908 a representative of a manufacturing concern in California arrived in Grand Junction with a carload of pots to sell and no market. Then along in April came a warning from the weather service of killing frost coming. Three or four of the more progressive growers determined to make an effort to save their crops and in a few moments the stock of smudge pots was sold. They were for oil and there was no crude oil in town, and no time to send for any. The experimenters were not discouraged, however, and they proceeded to buy out the stock of kerosene oil in Grand Junction.

That night the temperature dropped to about 23 degrees, and with the exception of a few orchards in favored localities the crop was practically destroyed everywhere but in those orchards where the pots were used. It could hardly be called smudging, for the cold was too strong for smudge to benefit. It was actually heating the orchard, and when the night was past the few men who fought against aparently hopeless odds were tired but triumphant. They had saved their crop, or the greater part of it. Unfortunately there were not enough of smudge pots to cover all the ground they desired, but as far as the pots covered the fruit was safe. James L. Hamilton had twenty acres of orchard divided in the middle by a road; he concluded to devote his efforts to ten acres on one side of the road. Result, a complete crop on one side and none on the other

While many points were settled very conclusively, there is still much debatable ground over details of methods and apparatus. Inventors of patent heating appliances add much to the confusion by extolling the advantages of their heaters, but these are comparatively unimportant details. It seems now to be agreed that orchard heating is effective. The details of method may perhaps affect the cost, but not the basic principle.

It was demonstrated that the heat used should be subject to regulation and adjustment. If the frost should be light but little fire would be required, but temperatures are liable to very rapid change. The thermometer might drop several degrees in as many minutes and the appliance must be of a nature to permit of rapid adjustment to these conditions. This was one of the objections to the use of coal. The coal fires once started provided a maximum heat which must burn normally or be put out. If extinguished, they must be rearranged for relighting and this takes time which might be fatal to the results desired.

There has been much confusion in the mind of the public over the theory of smudging and heating. The Grand Valley method is a combination of both principles of "heat" and "smoke," and while some are of the opinion that the heat is the main factor, and the smudge or smoke of no value in the general result, there are many who consider the smoke a great assistance in maintaining the heat. The original theory of the "smudge" is as follows: When the frost attacks the fruit blossom the cold draws the sap from the blossom to the surface and forms it into a frost crystal. It was found that when the morning sun reached these frost crystals it dissipated them so rapidly that this moisture, really the life blood of the blossom, was evaporated into the air and the blossom died. Fruit growers called this "scalding." The idea of the smudge was to provide over the orchard a shade which would keep the morning sun from the blossoms while the temperature gradually rose and melted the frost, thus permitting the moisture to return within the flower. The practice has been very successful for years both in this country and Europe.

In the Grand Valley some of the growers claim that as they do not permit the frost crystals to form, by maintaining the temperature in the orchard above the frost point, the smudge is not necessary. There is a faction, however, that argues with some degree of logic that the smoke, being composed of minute particles of carbon, which are heated when they leave the flame, is a material factor in maintaining the temperature, and that in quiet weather this heavy smoke forming above the orchard provides a canopy which not only retains the heat under it, but that the atoms of carbon absorb the cold and keep it from the trees. It will probably require some scientific experiments to determine which of the theories is correct. It is sufficient to say that all of the methods used in the Grand Valley made more or less smoke and that all were uniformly successful. It is agreed, however, that the system should be called "orchard heating," instead of "smudging," as the principle is based upon the idea of maintaining the temperature in the orchard rather than with potecting the frosted blossoms from the sun.

In the Grand Valley the following general principles of orchard heating are accepted as established:

First—The appliance for heating must be simple, easily controlled and adjusted and capable of quick application.

Second—The object is not to raise the temperature in the orchard, but to maintain it. It is agreed that it is much easier to maintain a safe temperature in the orchard, with a falling temperature outside, than to raise the temperature after it has declined.

Third—The danger period covers the time from the first swelling of the bud in the spring until danger is past. This covers a period of from four to six weeks, making allowances for the different varieties and the variation in time of blooming.

Fourth—Heating appliances should be placed in position in the orchard at the first indication of swelling buds, provided with fuel and be ready to fire at a moment's notice. In cases where there are no trees or other windbreak on the windward side of the orchard, a double row of pots should be placed slightly to the outside of the outer row of trees, as a safeguard against the deflection of the heat waves by passing wind currents.

The average danger point is thirty degrees, but when the temperature is falling it is best to start the fires when the temperature is at 33 or 34, and regulate the fires to meet conditions, seeking to maintain the temperature.

Fifth—Each orchard should be provided with a number of tested thermometers, which should be hung at an elevation of about four and a half feet from the ground. One or two thermometers should be hung outside of the heated area to guide the firemen as to actual conditions around the orchard.

Sixth—The heaters should be so constructed as to provide an adequate supply of fuel for seven to ten hours' burning. Oil pots should have a capacity of from two to three gallons of oil, or there should be enough unlighted pots in reserve to provide for every contingency. The critical time is usually just before sunrise in the morning, and there must be a certainty of ample fuel left for that time. The greater the capacity of the heater the fewer will be required to the acre.

Seventh—Eternal vigilance is the price of success in orchard heating. Take no chances, but when the temperature is going downward and is reaching toward the danger point, light up. Do not trust patent thermostats with electric alarm bells. When there is danger in the air keep your eye on the thermometer and be ready for quick work.

PROFITS OF ALLIGATOR PEARS.

The avocado, or alligator pear, as it is commonly called, is attracting considerable attention here of late among a few of the most venturesome people who are planting them on a commercial scale, writes A. R. Rideout in Whittier News. And well they may, for it is destinned to be one of the leading fruits of this section;; but being tropical it will not grow upon the low lands even here.

People are just beginning to waken up to the possibilities of this fruit in this climate. It has been thoroughly demonstrated that they will grow and bear well here.

Trees are now growing and bearing well in Pasadena, Hollywood, Monrovia and Whittier.

The fruit is not like a fruit, nor can its flavor be described. It is called the salad fruit. The English call it vegetable marrow, and well does this name apply to it, for it looks very much like marrow. It is very rich with vegetable oil and can be eaten by the most sensitive dyspeptic or invalid. The most popular way to eat the fruit is to spread it on bread like you would brtter, salt and pepper it if you wish and eat it this way; or just cut the fruit in halves and eat it with a spoon, or use lemon juice, vinegar or olive oil. If you do not like it the first time you will a little later if you continue to nibble as it is more alluring than the olive.

Some of the shrewdest business men of this section who have a keen eye for penetrating the future can see the possibilities of this fruit, which is destined to have a place upon nine-tenths of the tables of all the rich and poor in our fair land as far as the fruit can reach them. And this will be across the continent.

Only a few more years and it will be in most every dinner pail, in every restaurant and hotel, and the central figure of many a sandwich for you and others "to bite on."

H. E. Huntington has a nice planting on his home place at Oak Knoll. Planters will be criticized as were the first people to plant softshell walnut trees, and as they were who would put out the grafted walnuts—but just wait awhile.

The food value of this fruit will force it to the front faster than the supply, as they are now selling for 40 to 50 cents each, and trees bear from 500 to 2,000 fruits in a year. The fruit from one tree sold for $325, but at one cent each it will be a paying investment.

Seedling trees may bear at five or six years, and may never bear. Some may bear sparingly or worthless fruit but like all other choice fruits will have to be budded to obtain best results.

QUITE DIFFERENT.

Mrs. Subbubs (who has hired a man to plant shade trees)—Digging out the holes, I see, Mr. Lannigan.

Lannigan—No, mum. Oi'm digging out the dirt an' lavin' the holes.—Catholic News.

Deciduous Tree-Shrub Fruits

FIGS IN THE EAST.

To many of our eastern friends Ohio is yet on the frontier and beyond this is still the Great American Desert. Down the Atlantic coast are a number of civilized colonies but "Out West" is woolly and wild. Our good friend the Country Gentleman of Albany, York State, is a little inclined to ignore us save when roasting us because we want Uncle Sam to aid in irrigation development in arid sections.

In an article on "Studies in Fig Growing," the Pacific coast is, of course, ignored, but York State figs and those grown as far away from home as Carolina are referred to. It's interesting. Here it is.

One of the most interesting minor fruits in America is now the fig. Formerly this was only the plaything of a few cranks and amateurs. Andrew Jackson Downing used to play with figs in New York State, but fig growing was not taken seriously anywhere in this country until quite recently. Now it is being developed on a large scale in the southern states. We were reading only the other day that tons of figs were going to waste in southern Texas because the orchards were bearing more heavily than the canning factories had expected. In that section, the fruit is used chiefly for preserving, and there are extensive young orchards coming into bearing. In other parts of the South, however, as in Louisiana, Florida, Mississippi, Alabama and South Carolina, fig culture is coming to be a regular thing, and a small number of fig trees is considered quite as appropriate a part of the farm equipment as a similar number of Baldwin apple trees on a New England farm.

Some interesting studies of fig culture have recently been published by Prof. F. C. Reimer of North Carolina, giving a very practical discussion of this subject. He believes that the eastern half of North Carolina is especially well suited to the growing of figs, having a distinct advantage over the territory farther south. He says that the cold winter weather is more destructive to fig trees farther south than it is in North Carolina. This is due principally to the marked changes in the weather in winter in the former section. The tree is sensitive, and starts into growth quickly during warm spells and then is injured by any set-back. Figs can be grown in any part of North Carolina east of the mountains, although in the central sections they may need some winter protection. The extreme coast sections are especially well adapted to fig culture.

With respect to soil, the fig is not at all fastidious. It can be grown successfully in almost any soil, ranging from the light sandy soil of the coast to the heavy, sticky red clay soils of the Piedmont section. It will thrive on low, moist, marshy land, or on high, dry, sandy land. The best soil for figs, however, is a well-drained, moist, mellow, sandy loam, well filled with humus. It should contain an abundance of lime, and this consideration is especially important if the figs are to be shipped long distances, or if high quality is an important consideration.

The propagation of figs is usually effected by means of cuttings. As a rule, the method is easy and entirely successful. The trees should be transplanted in spring, as fall planting is found unsatisfactory. The distances apart for setting fig trees run from 10 to 20 feet. It depends upon varieties. Some varieties grow much stronger than others. The trees should be planted deep—from 4 to 6 inches deeper than they stood in the nursery row. Then they should be cut down quite to the surface of the ground. This induces them to branch freely and produces the desired bush form. In order to get this bushy growth, some planters consider it best to put four or five plants or cuttings in a single stool.

In the question of cultivation, the same controversy has arisen which has agitated some of the apple growers in the North, namely, the question of whether no cultivation is not perhaps better than the usual method. Professor Reimer does not hesitate to recommend cultivation. He says that while good results are obtained from both methods, by far the best results are obtained when the ground is kept mellow, moist, and free from weeds, and is cultivated shallow, so as not to damage any roots.

Heavy feeding is necessary for the success of fig culture. The tree is a rank feeder, and large quantities of food are required to maintain the foliage and to ripen the fruit. Stable manure is commonly used, and is particularly important in sections where humus and nitrogen are naturally deficient. Lime is also important. All the other fertilizing elements are also needed, and some of them can best be supplied in the usual forms of mineral fertilizers.

Pruning the fig tree is a delicate and difficult operation, not altogether well understood. In the extreme southern states, pruning is usually looked on with disfavor, but Prof. Reimer considers it to be an absolute necessity in North Carolina. He says that the fig should never be grown as a tree—that is, with a single trunk; every effort should be made to induce it to form a bush or stool. In order to secure these results, proper pruning is essential. It is highly desirable to induce low branches. This can be done both by winter pruning and by pinching back in summer. After the tree comes into bearing, little or no pruning will be required.

There are two crops of figs ripening annually on most of the trees grown in the central South, one crop coming in June and the other during September and October. There is a very interesting technical point connected with this difference in crops, for while the first ripening is not much earlier than the second crop, it is very distinct from it. The fruit of the first crop is borne on the last wood produced the previous season, while the second crop is borne on the new wood of the season's growth. The first crop is small, but the individual figs are large. The second crop is large, but the individual figs are small.

The weather during the pickling season should be dry, with an abundance of sunshine. If the weather is rainy or cloudy, the figs crack open and spoil. If there is a heavy dew in the morning the figs should not be picked until the fruit is entirely dry. The picking is a delicate operation and should not be undertaken by every greenhorn. The best hand work is required. Even at the best, the work is tedious.

The fig is one of the most difficult fruits to place on the market. The best shipping crate is the regular strawberry crate, holding 24 to 32 quart baskets; six-basket peach carriers are sometimes used, but the baskets are too large to handle the fruit to the bes advantage. The fruit must be handled rapidly, always shipped by express, and when possible in refrigerator cars. When they are properly handled, there are good financial results to be expected. One good North Carolina grower is quoted as saying that an acre of figs has netted him from three to five hundred dollars a year for the last five years.

The fig is coming into much larger use as a fresh fruit wherever known. It has long been considered almost a necessity in southern European countries, and has been eaten rather freely by those people who had a supply here in America. Undoubtedly the market for this fruit can be very greatly extended.

NATURE RENEWS ITSELF.

By Gerald Geraldson, Newcastle.

There is a natural law that few of us have discovered, but which, nevertheless, concerns every man, woman and child in the world, and therefore must be somewhat important. It is a modest little law and never makes any noise—just works and works, all the time, everywhere; and points and points all the time, everywhere.

It is in evidence everywhere and still those of us that are closest to it can't see it, presumably because we are too close to it; and the rest can't see it, presumably because they are too far away, and yet it is an exceedingly important law.

Briefly it reads thus: "A self-sustaining civilization will always leave one-half of nature's annual supply of vegetation to mature and ripen and seed, and to go back into the soil in nature's way"; or to use more words it could be stated thus: "Civilization is built on soil. Soil builds itself with matured vegetation. Any soil annually produces a certain amount of vegetation. Civilization, to maintain itself, may use half of this vegetation and still keep within the producing limits of the soil. The use of more than half of the annual output of matured vegetation will render the soil incapable of maintaining itself and it will be broken up and dissipated. And with the soil destroyed the civilization on it must be broken up and dissipated.

The simplest illustration of the working of this law is a piece of pasture land. Let us divide it equally. Both parts start off evenly with say one foot of green grass. During the first summer one piece is grazed off so as to leave say six inches of grass and the other so as to leave but three inches.

In the fall when the first rains come that field having six inches of grass will start a new growth almost immediately because the ground is shaded and does not dry out so readily as does the other which has only three inches. In other words, it conserves water bet-

ter, and by next spring it will be found that the six-inch field will show something over twelve inches of grass while the three-inch field will show something less.

If again the next year the six-inch field is allowed to retain half of its vegetation it will have something more than six inches to start on when the first rains come, while, if the three-inch field has again been grazed down three-fourths, it will have something less than three inches to start on.

Continuing these comparative methods of grazing for a number of years will show that the output from the two pieces of land will diverge enormously, the six-inch piece soon showing a total growth of twenty-four inches, allowing twelve inches to be grazed off, while the other, the overgrazed piece, will have fallen off to practically no output of pasturage, or so little as to render further grazing unprofitable.

This latter is the case in many parts of California today where many pastures are so bare that the first rains, which come when the weather is warm and when the grass starts readily if it is given a chance, all runs off immediately, starting no grass but, instead, washing away some of the soil built so laboriously in past years. Already the process has gone so far that gullies of from one to twenty feet in depth are not hard to find.

Now, in agriculture of any kind this same law prevails absolutely but takes the form of allowing all of the vegetation on half of the land to ripen and mature and go into the soil in nature's way, to enable nature to maintain and build up the soil. The cultivated crop that we take off the ground corresponds to the half crop of pasturage grazed off in the other case.

This kind of cultivation is an actual assistance to nature and really raises the total product of any given soil far above what nature could do in her primitive way because it buries the matured vegetation in the soil seven or eight inches deep while she deposits the major part of it on top of the ground.

The universal system of clean, annual cultivation is precisely the same thing as the overgrazing of the pasture land referred to. While dissipating humus it stops replenishment and must eventually result in the same disaster, the coming of which is timed exactly by the diligence of cultivation, the amount of wash, the amount of humus nature has stored up ahead and the amount of matured vegetation that is supplied artificially, as stable manure, for instance, and some minor factors.

An intensive cultivation that gets abnormal results on a "rich" piece of land, or through frequent cultivation and stimulation, is simply a running on capital and cannot be other than temporary. All such periods in the history of any piece of land must be followed by other periods of reaction and non-production which will bring the total output, over a long term of years, far below that which could have been realized by the conserving method I have outlined. Indeed, in the case of hillsides we must choose between this form of conservation on the one hand and ruin on the other; there is no middle ground.

Therefore I would urge, as earnestly as I can, that those persons interested in transmitting to their children fertile soil instead of wreckage, just try the system of plowing alternate strips on alternate years, and of allowing the unplowed strips to rest absolutely, on a small plot of land, for a term of four years. Surely this is a reasonable request; that you just try it; and in the case of the pasturage too. There is too much at stake to be indifferent. It costs nothing to try it. Only utter bigotry refuses to either listen or try.

HOW TO PRUNE PROPERLY.

There are two buds. One produces wood and the other produces fruit. On an apple tree the fruit buds appear on all limbs over an inch in diameter, but always at the end of a fruit spur, which appear after the tree is two years old. The spurs are small and very crooked, and many pruners take them off under the belief that their existence spoils the looks of the tree.

Pear trees have all the characteristics of the apple tree and the fruit spurs set in a similar manner. To interfere with these spurs is suicidal. The buds are to be found on the fruit spurs, but may be recognized by being round and soft.

The wood buds are small and flat with sharp points and are placed by nature along the bark of the trees.

Pruning is the most essential thing in the life and usefulness of the fruit tree. Do away with the axe in your tool kit and provide a pruning knife, a pair of ten-inch shears, a pair of three-foot pruning shears, a pair of ten-foot pruning shears, a saw and a bucket of paint and a brush. Any kind of paint will do, so long as it is a mixture of white lead. Even the skins which line old paint barrels and kegs can be utilized.

Pruning is done to keep the tree alive, in shape and within reach, as the expense of handling a fruit crop is in the use of step ladders to reach it. The best pruners do the work both in the summer and the winter seasons. Summer pruning produces fruit and winter pruning brings wood. Summer pruning should commence as soon after July 10 as possible, while the terminal buds are alive and the sap is running. The plan should be to cut back the twigs and branches which are making too strong a growth. That makes fruit spur.

Never make a heavy pruning in the tops of the trees, because the result is sure to be found in a heavy growth of water sprouts. If a heavy cut is made in the tops there must be a corresponding root pruning, which is impracticable. As a tree grows it puts out a root system to correspond with its top, and if the latter is cut back the sap which is taken up by the roots must be utilized somewhere, and it causes a growth which is undesirable.

In winter, prune any time after the leaves are off the trees, but the best time is about February 1, because thereafter only a short period will elapse before the sap starts and the wounds begin to heal and the tree puts on its wood growth. In winter cut out the cross-growing branches, the water sprouts, broken limbs, and head back the upright growing limbs so as to keep the tree flat.

In cutting off a branch use a saw. Make the first cut about four inches from the body of the tree, and on the under side of the limb. Next make a cut on the top of the limb and one inch nearer the tree. The limb will fall and not split the bark. Then cut off the stub of the limb as close to the tree as the saw will work, and at once paint the wound. Where the stubs are left they gather bacteria, become diseased and rot out, seriously damaging the tree, if it shall not be ultimately ruined.

Tree surgery is a branch of successful pruning which can hardly be covered in a short lecture, but the paint is the first aid to the injured. As the wounds heal, they must be watched and if for any reason the flow of sap is shut off, the grower must use his pruning knife to open a seam around the place through which the fluid may find a way to do its work. If the grower prunes his trees conscientiously during the first years, he will have little trouble with his orchard.—Prof. Chas. A. Cole, Oregon Agricultural College.

The Puget Sound Electric Railway Company is using Angora goats to keep down the growth of shrubbery along its right-of-way.

STANDARDS FOR GRAPES.

At the standardization meeting at Newcastle recently the discussion resulted in adopting the following standards for grapes:

"Grapes of standard pack shall be fully matured, carefully picked, properly trimmed, wilted at least 24 hours before packing, neatly packed in regular baskets, four baskets to a crate, the crates to be 4½ inches deep, with an 11-16ths cleat under the cover; no stems in sight."

If the fruited canes of the berry bushes were not removed last month it should be attended to now. Cut them out with a berry hook and collect and burn them. By so doing, many insect pests and their eggs are destroyed; whereas, they would escape if left until spring.

360-EGG SIZE "SUCCESS" INCUBATOR

$25.00 The Best Incubator value today. Every Incubator has removable nursery drawers, copper hot water heaters, double walls, double packed top, perfect ventilation, slatted egg trays, automatic regulators and **WE PAY THE FREIGHT.**

LET THE HART-PARR DO YOUR WORK

A Hart-Parr Tractor will do the work of 22 horses, and do it cheaper, better and quicker.

Establish a record this year in your farm work, by using economical power. Purchase a "Modern Farm Horse," and learn how to make more money with less work. You can do the work of 22 horses, and it will run a day and plow from 20 to 30 acres for about what it costs to feed ten horses.

There are thousands of successful farmers today who are using Hart-Parr Tractors to plow, seed, harvest, thresh and haul their crop. In fact you can do anything you can do with a big barn full of horses.

Let us tell you more about this "Modern Farm Horse," and its advantages on your farm. Mail us a postal card, and we will do the rest. We carry a full line of repairs that are guaranteed to fit. Two sizes, 15 Traction, 30 Brake, and 22 Traction, 45 Brake.

The Ornamental Garden

THE TREATMENT OF ROADSIDES

The planting of trees along all highways is usually insisted upon as a public duty by persons who take an active interest in matters which pertain to rural improvement. The first work undertaken by village improvement societies is most frequently roadside tree planting. The activity of Arbor Day is apt to expend itself in the same direction, and very often the work is commendable from every point of view. A long, straight, level avenue with a row of elms or sugar maples, or tulip trees on either side, set on smooth turf at regular intervals, is always beautiful. No nobler approach to a stately mansion can be conceived of than such an avenue. As an introduction to a suburban park, or the extension of the main street of a country village, especially when it leads to some object of adequate dignity, such an avenue is always satisfying. But in an open, hilly country, roadsides are not always improved when bordered by a formal line of trees. To one standing on an eminence, slender lines of foliage following the winding of various roads across the landscape would rarely be pleasing, and to one traveling on such roads the constant shade and the unvarying repetition of a tree on either side at equal distances would be still more displeasing.

It does not follow from this that the planting of trees along country highways should be discouraged, but it should be remembered that trees can be agreeably disposed in various ways, and that in many cases an occasional group of trees at a crossroad, or a single tree here and there at desirable points by the wayside, will prove more attractive than a monotonous row on either hand in which each tree is precisely fifty feet from its neighbor. It should be remembered, too, that shrubs and vines, and even humbler growths, should have a place on a road border, as well as trees, and there are many road borders where they are of much more importance than trees.

Only a trifling outlay of labor and expense is needed to transform the roadside or embankment into a sweep of verdure, which becomes purple and fragrant with bloom in its season. An unsightly gully filled in with brush to guard against a more serious washout, the hot, raw gravel slope of an excavation becomes in its turn a bower of beauty under the directing hand of one who thinks it worth while to render such service to the wayfarer. We have heard of a piece of road on Long Island which is bright with flowers in their season, through the thoughtful care of the gardener of a large estate near by. We know a mile of country road which grows more attractive every year because a little care is taken to introduce the flowers and shrubs and vines which flourish naturally in that region. Marsh marigolds and cardinal flowers have been made at home by the outlet of a wayside spring. Houstonia and bloodroot bloomed this year where they were unknown before. The thickets are fringed with an increasing variety of ferns, and club mosses are now creeping among them.

It is hardly to be hoped, however, that every land-owner will be persuaded to take such an active and intelligent interest in the treatment of roadsides.

It is a comfort to note that native shrubs are being used more and more in the best park work. These shrubs are proving themselves no less useful or appropriate along the smooth, broad and well-kept wheel way than they are in remote byways among the hills. Indeed, it is difficult to imagine how the hard, stony gutter line beside the road bed could be more agreeably broken than it is by the wild roses and red root that occasionally stray across it, or how any other shrub would take the place of the sumachs banked above a portion of a drive. Every one of these shrubs would grace a palace garden, and yet when they modestly appear along a rural highway they are mowed down to "improve the appearance of the country." If there is no reason to look for any general and organized effort to beautify our country road sides, let us hope at least that overseers of the highway may in time be induced to refrain from expending labor and money to destroy the native shrubs and vines and trees which clothe so many waysides with beauty as with a garment.—Garden and Forest.

DWARF TREES IN JAPAN.

These charming dwarfed trees are entirely a product of the patience and skill of Japanese gardeners, says "St. Nicholas." The dwarfing of these is kept a secret and has never been found out or imitated to such a marvelous degree by any other nation. While there are dwarf fruit trees grown in Europe, especially in Germany and Holland, no such tiny specimens have ever been produced there.

The trees which are used for dwarfing by the Japanese embrace all varieties of conifers, such as pines, cedars, cryptomerias, junipers, many evergreens, such as ilex and Citrus trifoliata; some flowering plants like azaleas and maples; some fruit trees, such as oranges and plums, which blossom and bear the most tiny fruits to perfection. It is claimed for some specimens of cedars that they are over 500 years old. These very ancient trees are handed down from father to son in some families, regarded as priceless heirlooms.—Green's Fruit Grower.

The lily has been given us in song and story for 3,000 years. Solomon sang of its grace and loveliness. Other writers in the Old and New Testaments have mentioned its beauty. Poets have sung of its worth and loveliness down to the present time. We have this mythological account of its origin: "Jupiter wished to make his boy Hercules (born of a mortal) one of the gods; so he snatched him from the bosom of his earthly mother, Alcimena, and bore him to the breast of the godlike Juno. The milk is spilled from the full mouthed boy as he traverses the sky (making the milky way), and what drops below stars and clouds and touches earth, stains the ground with lilies."

Garden and Field Crops

EXPERIMENTS IN BLUEBERRY CULTURE.

An interesting and significant feature in the experiments reported in Bulletin 193, of the Bureau of Plant Industry, just issued by the U. S. Department of Agriculture, is the light shed on the possible utilization of naturally acid lands that occupy extensive areas in the eastern United States, to produce the delicious blueberry or some other crop that thrives in acid soils.

The Department has found by experiment how blueberries differ from ordinary plants in their methods of nutrition and in their soil requirements, and by means of this knowledge it has worked out a system of pit culture under which these plants attain a development beyond all previous expectations. The failure heretofore of attempts to cultivate blueberries commercially as a market fruit, appears to be due to a misunderstaning of the soil requirements of the plants, which, as these experiments show, are radically different from those of our common cultivated plants.

The market would gladly pay a higher price for cultivated blueberries of superior quality. A marked distinction should be made in market quotations between the large plump blueberry (genus Vaccinium), whose seeds are so small as to be almost unnoticed when they are being eaten, and the huckleberry (genus Gaylussacia) in which the seed is surrounded by a bony covering like a minute peach pit, which crackles between the teeth. The failure to make this distinction in nomenclature, and the unsightly condition in which careless handling often presents the berries to the buyer, are the cause of much of the failure in southern markets to appreciate the blueberry at its real value. As the blueberry withstands the rough treatment incident to shipment so much better than most other berries, with proper handling it should always reach the market in first-class condition, whether shipped from North Carolina to Boston in early June, or Nova Scotia to Washington in late September, making the blueberry season cover a period of nearly four months.

To those desiring to experiment with field culture of the swamp blueberry, whether with wild plants, seedlings, or plants grown from cuttings, two methods of treatment are suggested both deduced from the experiments already made. The first method, suited to upland soils, is to set the plants in trenches or separate holes in well-rotted peat at least a foot in depth, and mulch the surface well either with leaves or with clean sand. The excavations should provide ample space for new growth of the roots, and the peat used may be either of the bog or upland type, and should have been rotted for several months before using. The soil should afford good drainage, the ideal condition of the peat about the roots of the plant being one of continued moisture during the growing season, but with all the free water draining readily so that thorough aeration of the mass of peat is assured.

The second method of field culture suggested is to set the plants in a peat bog after the bog has been drained, turfed, and deeply mulched with sand, just as for cranberry culture, except that no special provision need be made for rapid flooding of the bog for winter, and the ground water of the bog might be kept a little lower than is usual with cranberries. Before beginning the work, these experiments should be carefully studied by any one proposing to undertake the culture of blueberries.

ELEMENTARY HORTICULTURE FOR SCHOOLS.

Mr. Clayton F. Palmer, formerly instructor in agriculture and nature study in the Los Angeles State Normal School, and now director of agriculture in the Gardena High School, is the author of a manual for teachers and amateur gardeners. It is a 76-page book, published by the author, and sold at 50 cents. It is the aim of the book to arouse an interest, especially among teachers, in some of the phases of elementary horticulture. The author says in his introduction:

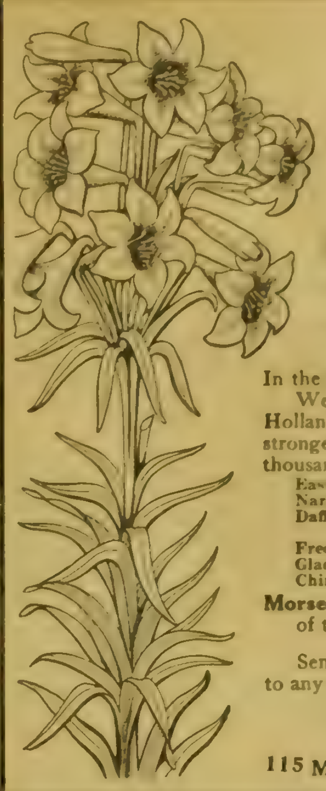
"A great deal has been said and written favoring school gardens as a valuable phase of nature study, or, more specifically, agriculture. Having conducted the work with several hundred students, and watched as many grade pupils at their garden work, the writer is firmly convinced of its value, and earnestly urges every school, which has available ground, and a teacher willing to undertake the work, to profit by the opportunities offered by the growing of plants. But there are many schools which can neither spare nor secure sufficient ground for a garden, and it is perhaps rather to such that this manual will appeal. Several different phases of plant production have been discussed briefly, and it is believed that every school will be able to make use of at least a few of these suggestions."

MUSHROOM GROWING.

The chief essential for success in the growing of mushrooms is to have the manure in the correct condition before the beds are made up. It should be horse manure from stables where the horses have been fed chiefly on dry foods, without too much in the way of greenstuff, though growers often have to chance this, and use large quantities of town manure.

On the arrival of the manure the dry, unstained straw must be separated from the mass, and placed on one side. It will come out later on for covering the beds. The rest should then be put in a compact heap, as if making a long hotbed. After a few days it will be heated. It must then be turned, carefully separating all the lumps and mixing evenly, bringing the outside parts to the centre of the heap. This needs doing from four to six times on alternate days, according to the rankness of the manure, as it must be quite sweet and thoroughly decomposed before made up into beds.

The difficult point is to tell when it is in fit condition. It should be an even mixture of quite short straw and droppings, and must no longer smell offensive, but rather suggestive of the odor of mushrooms. Watering may be necessary when turning the manure if it appears too dry. It is not a crop to be undertaken on a large scale by a beginner, but an experienced grower has no difficulty in securing a yield.



Plant Easter Lilies Now!

Wouldn't you like some beautiful Easter Lilies in your garden in the early spring? Or a profusion of shimmering Daffodils? Or dainty Freesias? Or the early white Gladiolus?

Then send for a few of our Bulbs and plant them *now.*

In the hot house they will flower by Christmas. In the garden or window boxes they will bloom in spring.

We carry a vast assortment of Bulbs grown for us in Holland, France, Japan and China, the best selected, strongest, most hardy bulbs from gardens chosen from thousands in those various countries.

Easter Lilies .... $1.50 per doz.
Narcissus, Paper White ..... 30c per doz., $1.75 per 100
Daffodils, Trumpet Major......35c " " 2.50 " "
By mail 12c per dozen extra.
Freesias (post-paid)............15c per doz., $1.25 per 100
Gladiolus, the Bride (post-paid) 25c " " 1.50 " "
Chinese Sacred Lilies ....$1.00 doz., postage 35c doz. extra

Morse Special Bulb Assortment consisting of 130 of the finest bulbs in our stock.................$2.10
(Postage 10c extra

Send for our complete fall catalog of bulbs mailed free to any address on request.

problem of the future. The former are excluded, and it is useless to attempt to persuade congress to readmit them. The latter are called back by their own government to be poured into Korea and Manchuria and we need not expect, unless conditions are materially changed, to see them in any considerable numbers again. If the orchardists of California must have a class of "servile labor," from which calamity, good Lord, deliver us! they must take up with the Hindu, a class that for inbred laziness, complete ineffectiveness capacity for lying, cheating and general depravity, has the Japanese beaten to a frazzle. And so far as commerce is based upon the ancient theory that these latter qualities are essential, in so far they are successful competitors of our own merchants. Economically, as shown by the experience of South Africa, the Hindu is a dangerous competitor.

Socially, he is even more dangerous. He calls himself an Ayrian, though few of them have any title to this claim, and through that ancient stock a cousin of the Caucasian. Many of those who come here have served in the native forces of the Indian (British) army, and some have been educated in the Anglo-Indian schools. It is not unusual to see well-built, handsome fellows among the grizzled brigands and starved pariahs that come in the Bombay steerage, and when these are well fed and groomed, and their crooked tongues loosened with English speech,—well, there will be less argument about the impossibility of the Asiatic assimilating with the Caucasian. He has the same ambition for social equality that animates the Japanese, but probably in a greater degree, has more guile, and more advantages. It will readily be seen, therefore, unless we are ready to pay the price of social demoralization, that we do not want the Hindu among us, and should not permit his presence.

And we cannot, should not, pay the price. Let us turn rather to the white labor, that this report of Mr. Mackenzie says is impossible without an entire reformation of the methods employed. The sooner we set about this reformation the better, and end, by a wiser system than we have followed in the past, the curse of the idle, wandering white. The "blanket man" is himself an indictment of the California employer. And every farmer's son who knows more of grammar or bookkeeping than he does of the science of agriculture, is an example of California's folly in neglecting to train her children in the way that they should go. Let us consider this matter before it is too late, and putting aside selfish considerations, shut and bar the gates against the inferior races while at the eastern door we welcome all honest, industrious whites to our fertile fields. Then, with the aid of a wise and generous system of education, a new and better class of California citizenship can be bred up, not of drunken, lazy whites and brown and yellow "American-Asiatics," but of lily-white, rosy-cheeked, blue-eyed Americans, who will make California richer in her harvests and more productive in her mining and manufacturing industries than was ever dreamed of by her most optimistic statesmen. And in so doing, California will save the nation from the worst disaster that has threatened her in all her history.—John T. Bramhall.

TREATMENT OF SMUT IN GRAIN.

Every farmer knows what smut in oats or wheat means. He knows how a field of wheat which gives promise of 20 bushels per acre of grain will produce, infected with smut, only 15 bushels or less, and inferior smutted grain at that. Every farmer ought to know that such smutted grain if not treated before seeding will again produce smut—more smut than before. Every farmer ought to know that even if his seed looks clean, it may still have smut on it, unless he is sure that it comes from a field without smut and that it has not been contaminated with smut in the separator, in the bin, sacks or seeder. Finally every farmer ought to know that by a simple, inexpensive seed treatment he can be absolutely sure that he will have a clean crop—he can buy insurance against smut at a very low cost by treating his seed.

Several methods can be used on the farm—only one of these will be described. It can be recommended to any farmer for cheapness, efficiency and simplicity.

Buy from a reliable druggist standard "formalin" of guaranteed strength "namely of 40 per cent solution of formaldehyde). Mix 1 pound (1 pint) in 45 gallons of water is an ordinary wooden barrel and stir it. Two ways of applying this solution to the grain can be used:

1. Dipping Method: Put the grain in clean sacks that have been first placed in boiling water for a few minutes; take each sack of grain and dip it in the solution in the barrel—raise it and lower until each seed is wet; set the sack on a clean floor and let it stand over night. The grain can then be dumped out on a clean floor or left in the sacks until it dries enough to let it run through the drill. (A floor is clean when it is washed with boiling hot water). Be sure not to let the swollen grain stand so long that it will sprout. If it cannot be sown immediately, it should be thoroughly dried and may then be kept indefinitely. When dry enough to run through the drill, sow it. Be sure the drill is clean. Sow more seed per acre if the grain is swollen.

2. Sprinkling Method: Make the solution the same as in the dipping method. Put the grain on a clean floor, spread it out and with a sprinkling can sprinkle the solution on it. Shovel the grain and sprinkle again. Repeat until each kernel is moist but not too wet. Shovel into a pile and cover with sacks or canvas over night. Then spread it out and shovel occasionally until dry enough to sow. Follow the precautions for drying and sowing given under the dipping method.

This treatment will prevent the following common smuts:

Oat Smut.

Stinking smut (or common smut) of wheat (but not the loose smut or "black head").

Covered smut of barley (but not the early or loose smut).

Grain smut (or common smut) of sorghum (or "cane").

If it does not prevent these smuts you have not followed directions. It must be remembered that this treatment will not prevent corn smut, "black heads" (early smut) of wheat, nor the early or loose smut (one of the common smuts of barley).—University of Minnesota Farm News.

Cottonwood, Idaho, farmers are selling their barley at 85 cents.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

GOOD AND BAD BITS.

I do not doubt that there are a good many men who now and then put a savage bit into some favorite roadster's mouth in order that his fiery temper may the better be curbed, without realizing the extent of the cruelty they are practicing, and with no other intention than to make the horse safe to drive. They should think twice before they inflict needless pain upon a faithful animal.

The inner portion of the mouth of a horse, the delicate membrane of pinkish or somewhat darker hue, has a mass of delicate nerve filaments spreading over its entire surface. The nerves are very sensitive to the touch, and any sharp or unusual thrust upon them causes intense pain. This pain is carried by a set of inner nerves, as well as by a set that runs along under the jaw, up the side of the jowl, and thence into the very center of all pain, the brain, between the slender, sensitive ears. It is difficult for anyone to say just where the seat of pain is, whether it is in the finger which you bruise or in the brain to which the message of distress has been telegraphed; but the question of location is not essential, while the question of distress is all-important.

It is very probable, however, that the brain of the horse, through the series of nerves so intimately connected with the large nerve area of the mouth, is the seat of the intense pain which comes with any undue attack upon these nerves. Anyone who has had a tooth extracted, or who has had any trouble with an ear, or who has been bound in the cruel bonds of facial neuralgia, knows how quick and imperative is the connection between the nerves of the head and the brain itself.

If you should cauterize deeply the inner surface of the horse's mouth, so that all the nerve centers were seared over, no doubt the pain of a cruel bit would be abolished; but at the same time the sensitiveness of the horse to the guidance of its master would be lost, and the value of the bit would be gone. Yet precisely this may happen after a long use of some hard and cruel bit—it may at least so callous the mouth of the horse that it does not hurt him in the old way, and he refuses to respond to the rein. The nerves are all essential; they should be kept in their natural state if the horse is to be a safe, tractable, well-behaved, well-governed animal.

The training of a horse is, to a greater extent than many people believe, the training of his nerves, or, to put it in another way, the training of his disposition, which, in the last analysis, is very much the same thing.

If a horse's nerves have been kept in a healthy, normal condition; if he responds quickly to the various incidents of the horse life; if, in a word, he is just a natural horse, with natural horse likes and dislikes, he is the ideal animal in so far as tractability is concerned. And on tractability depends much of the horse's usefulness, much of his value. If his nerves, and particularly the nerves of his mouth, which are so quick to take the message of pain to the throbbing brain, are not normal; if they are subjected to undue irritation; if, at last, they become immune to all save the most brutal and vicious attacks, then the horse becomes an abnormal creature, he loses one of his most essential elements, he is fit for the cheap horse market, where only second-hand wares are offered for sale.

So in this question of inhumanity to horses by means of bits that are cruel, it is not humaneness alone that is to be considered. That, indeed, is the higher and governing element in the question, but beyond that is the question of dollars and cents.

The man who habitually uses a cruel bit upon his horse's mouth not only does violence to all that is noblest and best in his own nature, but he inflicts a direct damage upon his horse from the standpoint of value. A well-bred horse is a delight; a well-bred, well-broken, good-dispositioned horse is even more than a delight—he is an entry on the right side of the banking account.

I have often been asked when the time would come when the horse would be driven without anything in his mouth, controlled by some sort of a band about the nose and jaw?

There is no horse of good normal spirit which may not at some time become frightened; he may become frenzied. Just as a lot of sensible, well-behaved, sedate human beings may, in the presence of great danger, become converted into an unruly, mad mob, so a horse, under peculiarly trying conditions, may lose his head. The best horse in the world has not greater self-command than the best man, surely. Under such circumstances, it is not possible to restrain a horse merely by the use of a strap; there seems to be nothing but the metal bit which will hold him.

Even with the use of a bit, there are times when a horse, to use the common expression, takes the bit in his teeth, and then there is no stopping him until he has run his course. For very many reasons the bitless driving would be desirable, and under normal conditions it may be that it will become successful.

There does not appear any tenable ground upon which the use of a harsh bit—one of those cruel, merciless refuges of the mean man or the cowardly one, is warranted. Perhaps there are times when some bits other than the humane one are permissible, but such times are very rare—so rare as to afford merely an exception to the general rule of humaneness, which should be the governing rule in the heart of everyone to whom has been entrusted the care and the driving of one of the noblest animals God has given to man. —A. T. Sibbald, in American Cultivator.

Alfalfa should be fed work horses as a concentrate or grain, rather than as a roughage, and should never be fed in unlimited quantities. Many farmers feed all the alfalfa hay the horses will eat. This should not be done, especially when the horse is worked hard in hot weather. Alfalfa is a good winter feed for young and growing stock.

AUCTION
170 Fine Dairy Cows 170
50 HORSES
HOGS IMPLEMENTS
Santa Ana Jersey Farm
SANTA ANA

☞Take electric cars to Artesia street, Santa Ana, walk one-quarter mile south to Ranch.

Thursday, Dec. 29, at 9 a. m.

170 Head of the finest Dairy Cows in California, mostly high grade Jerseys, a few Thoroughbreds and Registered, also a few choice Holsteins. These cows are young and in the pink of condition; large, fine cattle, many fresh, giving large quantities of milk; others coming in soon. Average test of entire herd better than 5 per cent.

We have sold many herds of fine cows in California, but we wish to state to the public that this is one of the very finest herds that we have ever offered in the State at public auction. Purchasers looking for the very finest Dairy Stock or Family Cows should not miss this sale. Prospective purchasers are requested by the owner to visit the ranch prior to sale and see cows milked and tested at 3 a. m. or 3 p. m. daily. We also wish to call attention that this is one of the Finest Equipped Dairy Farms in the West, and it will pay any dairyman in this State to attend this sale. These cows are all selected from the very finest herds in the West and have been carefully culled until there is nothing but strictly first-class stock in the entire herd.

25 Head of Brood Sows and Pigs, 15 Head of all-purpose Horses and Mares, 5 dozen Chickens, fine new Milk Wagons, Harness, Implements, Household Goods, etc.

The Santa Ana Jersey Farms Co. have disposed of all their routes and are closing out their entire herd and positively retiring from the business, and purchasers can attend this sale with the assurance that the same will be a bona-fide sale.

TERMS—$100 and under cash, over $100 one-third cash, balance 4 and 8 months' time with bankable note and 8 per cent interest. 3 per cent discount for cash on time sums.

In case of inclement weather, arrangements have been made to conduct the sale under cover, so sale will take place regardless of weather. Do not miss this opportunity to see the fine herd of Dairy Cows and the finest equipped Dairy Ranch in California. Remember sale commences at 9 a. m. sharp. Old-fashioned Spanish barbecue at noon.

WIRE CUTS ON STOCK.

Perhaps no class of injuries is as common to the horse as are barbed-wire injuries, and at least two-thirds of such accidents are due to the negligence of horsemen. A loose wire, in the lot, or along the pasture fence, hitching the horse for a few minutes to a fence where the bottom wire is down or when we knew the horse was apt to fret and paw or an old wire gate left down when we drive the horses in or out of the pasture or lot, all contribute to the scarring and causing permanent injuries.

If there is a serious cut about the lower portion of the leg or foot, the first thing that may need attention is to stop the flow of blood. Generally a wire is of such a nature as to tear the blood vessels in an irregular manner and to cause but little bleeding, but occasionally a large vessel is cut and it is necessary to stop the bleeding. The first thing to do in an emergency of this kind is to keep your wits about you. If necessary feel into the cut and learn where the blood is coming from, whether from above or below the cut. If you can find the vessel try and pass a cord over the end and tie firmly. A soft leather strap, a piece of rope or even a suspender may be tied around the leg either above or below the cut as is necessary and then place a stick under this band and twist it as you would a twitch. You can increase the pressure over the blood vessel by placing a piece of wood or hard substance under the band and then tightening up as before.

This band cannot be left on the limb any great length of time, but it will give you time to either secure help or devise some means of stopping it yourself. Powdered alum or tincture of iron are good to use in these cases. Do not fill the cut with dirt, soot, flour or ashes, as this is never necessary.

A wire cut in the fleshy part of the leg or body will heal much quicker than one on the foot or lower part of the leg. The character of the tissue has a great deal to do with healing as a cut in muscle will heal much quicker than where ligaments and tendons are cut. Suppose that a physician should call to dress a wound on the horse's owner and begin by using ashes, axle grease, pine tar, lime or soot? How much of that treatment do you think the man would stand for.

Too often wounds are prevented from healing by the frequent application of some irritating drug. Again, horses are too often turned to pasture where wet and weeds do even more damage than the irritating drugs used. A wound should be kept as clean and dry as possible and a horse with a wire cut about the feet or legs should never be turned to pasture when the grass is wet.

There are a great number of remedies that may be used on wire cuts that will stimulate healing and also keep the wound in good condition otherwise. As a rule the less washing and soaking that you can do the better it will be for the sore. As a wash you can use no better material than some of the coal tar preparations, of which cerolin is an example. Every stockman should keep this material at hand for use on his stock. For a wash use an ounce of the drug to a quart of water and you will have a wash that will not irritate and still have a wash that will cleanse. A powder made as follows will answer most purposes as a dry dressing: Boracic acid, four ounces; zinc sulphate, one-half ounce; iodoform, one-fourth ounce. Mix these and place some of the powder in a salt and pepper shaker and dust it on the sore two or three times a day.

If a wire cut is on some part of the body where there is but little movement, it may be stitched without the stitches tearing out, but if the cut is where the muscles are used in walking or feeding it is best not to try and close the wound, as the stitches will most certainly tear out, helping to make the scar more unsightly than it would have been otherwise. As a rule a wire cut should not be tied up unless the weather is cool and extra care is given to it. It may be necessary to protect the wound against flies, but this may be done by taking a mixture of fish oil and oil of tar and applying it with a feather to the hair surrounding the cut or iodoform may be dusted on the sore two or three times a day.

If the wound becomes irritated by strong drugs, poisoned by weeds, etc., there will generally be a growth of what is called proud flesh. This is an unhealthy growth and should be removed by the knife or by such drugs as powdered alum, (burnt) calomel or some slightly caustic material. As soon as possible the use of these irritating and caustic drugs should be stopped. Occasionally a wire cut will partially heal and then leave a chronic sore that has but little tendency to heal. We have blistered these with a fly blister and stimulated healing when other means seemed to have but little effect. A wire cut will heal on the horse as quickly as a wound will heal on a man if it is kept in the same manner.—Farmers' Star.

CARE OF THE CARRIAGE AND HARNESS.

All of the harness used on the farm should, at least twice a year, be taken apart, washed clean with soap and warm water, and thoroughly oiled. Neat's-foot oil is about the best oil that can be used for this purpose, although there are several good harness oils on the market. For black harness, the addition of a little lampblack is advisable.

If you have a bench on which to work, so much the better. If not, then an old door or a couple of boards supported at the ends at a convenient height will answer.

Go over each piece, using plenty of oil and working it well in underneath the keepers. As you oil them, hang up the pieces across a line or pole and in a warm temperature, but not in the sunshine.

As the oil is absorbed, go over each piece again as often as is necessary until it will absorb no more.

Wipe off the superfluous oil with a cloth, and then, if you wish to, you can give the carriage harness a finishing coat of harness dressing. This is better put on with a brush, as it is a quicker and more economical method than using a sponge. Many people may think that the use of harness dressing is an unnecessary waste of time and money, but a can of it will last a long time, and the use of it will keep your carriage harness looking better longer and in better condition than if not used at all.

For a finishing coat for the work

harness, use some good harness soap. Pure oil opens up the pores of the leather, and this last rub of harness soap keeps the harness in better condition during wet weather. Before putting the harness together again, clean the metal trimmings, and be sure to keep the bits bright. Nothing looks worse than a rusty bit. Use only a little sweet oil on the patent-leather parts.

After driving in wet weather, or at least once a week if you use your carriage harness often, clean it with a damp sponge and give it a coat of harness dressing, or soap, as you prefer. Also give the work harness an occasional cleaning with harness soap.

Go over the harness carefully when you take it apart, to see if it needs any repairs, and, if so, get it repaired before you oil it.

If you have to tie up a broken part with string or wire to enable you to get home, do not use it again in this condition.

Keep your harness in a dry place. You cannot keep it looking good if hung where it is damp. It is a good thing to have a harness closet.

The carriage should be washed every time it is used, and the best time to wash it is as soon as it comes in, especially if it is muddy. Leaving the mud on for any length of time will dull the varnish.

Mud should not be washed off by means of a sponge, as this method will scratch the varnish. If you have a hose, let the water run gently until the mud is softened and floated off. Do not use full pressure, nor a nozzle, as this will cause a grinding effect of mud and water which is bad for the varnish.

After the mud has been taken off, go over the carriage with a sponge and plenty of water, afterward wiping dry with a soft chamois skin. See that the sponge has no hard parts or shells in it.

Do not turn the hose on the upholstery, as the water gets into the folds and under the buttons and rots it.

If you wish to give the carriage a polish, mix one part turpentine with two parts boiled linseed oil; pour a small quantity on a small piece of cloth or flannel and go over the wagon with this, then polish dry with a soft flannel cloth.

Examine the carriage occasionally to see that all nuts are tight. Use castor oil for the axles, a little at a time, and oil often. Wipe off the axle before you oil it, and also the inside of the ends of the hub. See that the wheels are properly supplied with washers.

Wipe the grease off the wrench before putting it away. Keep your carriage covered when not in use, and keep the cushions where the mice cannot get at them.—A $10 Prize Article in Farm Journal.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.

LAME HORSES.

Lame horses are frequently a source of a great deal of worry, trouble and anxiety for owners often seem to think that a veterinary surgeon should be able to render a horse fit for work almost immediately. As a rule the majority of lame horses are lame low down about the foot, especially in the fore extremities; and in the hind legs the hocks are most frequently the seat of trouble. At times the seat of lameness is very difficult to localize, especially where there is nothing to see to account for lameness. As an example, take shoulder lameness; the animal is unable to rise or extend the limb; if about the foot the leg is flexed and extended, and it is not until the foot is on the ground, or about to be removed from the ground, that lameness is visible. In splint lameness, although there is frequently nothing to see, great lameness is often present. The animal walks nearly, or quite, sound, and trots very lame. In lameness of this kind, without anything to see, it is probably due to splints, especially in a young horse. Shoeing is a very frequent cause of lameness, and, in a great many cases, of incurable lameness. Sufficient attention is not given to this matter. It often happens that by a little mechanical contrivance in the alteration of the shoe, or in the way the foot is shod, the horse will travel sound or become workably sound. Bad shoeing and the mutilation of the foot renders many a good horse valueless, and cutting away the frog, removing frog pressure, cutting at the bars and shortening the toes are main causes of chronic diseases of the foot. The horse's foot, being exceedingly vascular, and its blood supply great, it naturally follows that if the foot is mutilated the blood supply becomes impeded and consequently chronic diseases and atrophy are set up.

BREAKING THE COLT.

Don't break the colt; train him. Begin as soon as he is born and pet, lead, feed and water him. In fact, treat him as though he were a horse.

Teach him what whoa, get up, gee and haw mean by gently pushing him the way you want him to go, then when old enough to work he will know what you want of him.

You can even get him used to the harness by adding a strap at a time and to the shafts by fastening poles on either side of him occasionally. Teach him to draw by putting on very light loads at first and heavier as he gets used to it.

A colt handled in this way will be true and honest, as he will never know he is being made to work. He will love his master and delight in doing what he is told to do, while the one that is taken from the field in a wild state will rear and plunge, smash things and probably get loose and run away, after which he is almost spoiled for a trusty horse. Besides it is cruel to treat them thus, as they never know what is wanted of them.

COLUMBIAN DAIRY COWS.

An effort is being made to spring a new breed of dairy cows in New York state. It is called Columbian, in appearance so far as we can judge from photos, somewhat like the Guernsey. Regarding the breed we note in correspondence in Hoard's Dairyman:

"In the improvement of dairy breeds by selection, environment, feed, etc., for the greater utility to the dairy farmer, two characteristics should be placed foremost. These are performance and constitution, or vitality, and after these beauty and symmetry of form. The history of this new American breed, the Columbian, breeders of dairy cattle will do well to study closely and learn its lessons. About thirty years ago Anson Gregory was keeping a herd of native cattle on his farm in Oswego Co., N. Y. He noticed that one cow in his herd gave more and richer milk than the others, and he raised her heifer calves year after year. Mr. Gregory wanted a sire from a different herd, and he bought a line-back, its dam being his neighbor's best cow. Mr. Gregory's best cow was bred to the line-back bull for several years and a strain of line-back cattle was established.

"Their type of cows being now established, three years ago the name Columbian was given these cattle, under a charter from the state, and the Columbian Cattle Breeders' Association was organized with five members.

"The best and largest herd of Columbians is now owned by C. O. Gregory and his father on the farm where the breed originated. They have thirty-three cows."

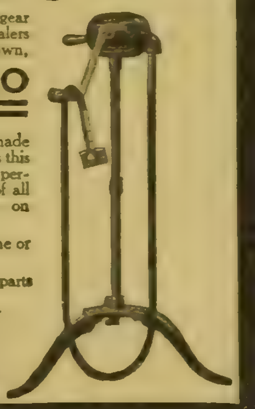
Clip Your Horses

with this superb Stewart No. 1 Ball Bearing Clipping Machine

The great enclosed gear machine at your dealers all complete, as shown,

only $8.50

No machine ever made at any price equals this one. It is the most perfect in every way of all clipping machines on the market.



It turns easier, clips faster and lasts longer. If you have but one or two horses it will pay you to have this splendid machine.

The gears are all cut right out of the solid bar, and all wearing parts are file-hard. It will last a lifetime.

If your dealer hasn't it, write us direct. GET ONE NOW

Parcels Post

There is no doubt that the present Congress is going to be informed on the parcels post question. Being a short session, it is very probable the bill will be mussed around and passed over and the session end without anything practical being accomplished, though the warm friends of an improved postal service are hoping that we may yet secure for Americans the advantages which the American postal service grants to foreigners. As an instance of this discrimination we quote as follows from an address by President Chas. S. Barrett of the National Farmers' Union:

"We have international parcels post agreements with forty-eight nations, with a maximum weight of eleven pounds and a postage of twelve cents per pound. The maximum weight in our own country is four pounds. The rate is sixteen cents a pound. If you want to send a four-pound package even ten miles it will cost you sixty-four cents. You could send it to Naples or London for forty-eight cents.

"In England, where the maximum is eleven pounds and the rate reasonable, the farmers are shipping eggs and other truck products by post at such rates as make it profitable to raise these products.

"Consider what the American express companies charge you for eleven pounds of your farm products, either for fifty or five hundred miles, and you see where you are being bled."

President Barrett represents three million members of a great organization and it is heartily in line and working to secure for Americans this relief from the extortion of the express companies. This extortion is well known to every one who has had occasion to send parcels or to inspect the reports of dividends declared by these companies. The public, excepting in a few cases of deluded country merchants, is almost unanimous in its demand for this cheap carriage of parcels. The country storekeeper, unfortunately, has been led astray by the claims of the express companies and is following their lead in the cry that cheap parcels post means the transfer of their business to the big mail order houses. If such is the case—and we do not think it is—the advantage to the producer in enabling him to market his products in a small way will far more than offset this loss. But we believe there will also be an advantage to the storekeeper. His ability to replenish stock with greater ease under the improved parcels system will enable him to keep more up-to-date and so compete with the larger city stores.

In the matter of increasing the revenues of the Department we are not qualified to judge, but it looks to us as if the Department needed to do something in order to increase its income.

Christmas—Xmas

We recently saw in a communication to a newspaper the statement that whenever the writer saw an advertisement in a newspaper in which the word Christmas was written Xmas, he made up his mind never to buy from that store. His reason was that the contraction Xmas is an insult to Christianity, as he considered that the X is used in the same sense that it is in algebra, as standing for the unknown quantity.

While we agree fully with the writer in having a prejudice against the use of the word Xmas, we do not think he is correct as to meaning of the letter X in this connection. As we understand it, it is from the Greek form of "ch" which formerly stood for Christ, hence its use as a contraction in Xmas is not intended as a slur, but with the correspondent we hope the day may be honored by the use of its full name. It sounds better and is better. It is somewhat like the idiotic abreviation "Calif." for California. California is indeed a beautiful word. Let us honor our state by using it in full. Christmas is likewise beautiful and a fitting word; let us not be in such haste as to contract it. For our subscribers we wish it may be the merriest and happiest of days.

Vaudeville Fairs

A correspondent in an Eastern farm paper suggests that so long as the agricultural fairs, state, county and smaller, are all over at this time of the year, it might be well to discuss the advisability of a slight change in manner of handling them. From the trend of his letter we take it the Eastern fair management is much the same as in California; that is, live stock, agricultural productions and farm implements are tolerated as features of the fair, while vaudeville stunts, the pike and the midway where the barker reigns supreme, are the great central attractions. Advertising for the fairs makes much of these events. Of course the latest is a flying machine, which is essential to any self-respecting fair. After touching upon these features the writer says: "I would suggest that in place of 'vaudeville' we have contests of teams from all our high schools and colleges in all lines of games that are recognized as essential for students to keep up their physical development. I believe those who are simply seeking exciting entertainment, and have no desire to pay for a ticket unless they are offered such things are not the safest ones to have the welfare of the state placed in their hands. Those who are thoughtful and industrious are the ones who forward the welfare of the state."

Building Packing Houses

We note in the accounts of the spread of the exchange movement in Florida one step which we believe to be a mistake. It is in the forming of a syndicate to build for the growers packing houses which will be run by them. Having seen the perfect ease with which California growers have acquired and maintained their own packing houses, it occurs to us that Florida growers should likewise construct and own theirs. The plan proposed is for the growers to pay to the syndicate seven per cent interest, together with a sufficient sinking fund to cover the entire cost of the houses, and when all is done, the syndicate will own the houses. We believe one of the strongest points in the California Fruit Growers exchange plan is the ownership of everything from the start to the furniture in the Eastern offices.

The short courses in agriculture at the University Farm at Davis had a total enrollment this year of 152, or subtracting for registration in more than one course, the number of individuals was 119. The attendance at the University Farm High School for the school year which began in October is 77. While these registrations are not as great as they should be, they are an indication of the increasing popularity of the institution.

Seeds and Plants

We have the 1910-1911 Seed Bulletin of the Agricultural Experiment Station of the University of California and note the report of last year's distribution and a list of plants and seed for distribution this year. This bulletin may be had by addressing Prof. Wickson, Director of the Experiment Station at Berkeley.

For the year 1909-1910 there were 425 packages mailed and 1730 more of seeds distributed. These went to 55 of the 58 counties of California. The bulletin calls attention to the fact that these distributions call for report of the results of the year's trial, and to the fact that many of the recipients failed to make this report. The reports should be made to the Experiment Station, for sometimes it is as important to know what plants fail in certain localities as what ones succeed. Amongst the seeds offered for distribution this year are rust-proof wax butter beans, radishes, stringless beans, pepper cress, sweet peas, and others.

Farmers Institutes

J. B. Neff, Conductor of Farmers' Institutes for Southern California, announces institutes arranged for Burbank, December 28; Montebello, December 29; Lankershim, December 30. Another series is arranged for Imperial county from January 30 to February 4. This is the same series which was to have been held last week, but was postponed on account of the Imperial County Fair.

Cotton

The Bureau of Statistics of the Department of Agriculture reports that the total production of cotton in the United States this year will amount to five billion pounds, equivalent to eleven million bales. The greatest production by any state is that of Texas, [illegible],140,000 bales. Georgia is second with 1,750,000 bales. California is the smallest producer on the list with 12,000 bales. However, she is only 1000 bales short of the state of Virginia, one of the oldest producers.

Agriculturists who have felt the need of legislation more favorable to one of the greatest industries of the state have learned a lesson as to the manner of securing it. Too often in the past the matter has been delayed until the legislature was in session or perhaps half over, when bills were presented, to be followed by a good healthy grouch at the close of the session because nothing was accomplished by the introduction of the bill. Legislators-elect have this year been informed as to the needs of agriculture and proposed bills brought before them and fullest discussion entered into, and the opening of the state legislature is yet two weeks away. Fruit growers in the southern part of the state met with the assemblymen and senators in the city of Los Angeles and discussed questions which concern the fruit growing and agricultural interests. The result is that the legislators are going to Sacramento more fully informed and prepared to fully represent their constituents.

The legislative committee of the Farmers' Union of Washington met at Spokane and discussed matters of legislative interest to farmers, and resolved that the penitentiary jute mill should be run to its fullest capacity, and that bags be sold to farmers at actual cost.

Agricultural News Notes of the Pacific Coast

Northern California

Chico high school is the latest to install an agricultural course.

Sutter county orchardists have begun their winter pruning.

The dairy industry is having a great impetus at Willows, Glenn county.

Corning, Tehama county, ships weekly over $1,500 worth of eggs.

A million-dollar irrigation company has been organized in Tehama county.

There are over 2,000 acres devoted to olive culture around Oroville, Butte county.

The Alameda Sugar Company, at Alvarado, is planning to double its capacity.

Sacramento capitalists have located 250,000 inches of water and a reservoir site in Placer county.

Dry Creek, in Butte county, will be dredged and deepened, that the flood waters may find easier flow.

The recent poultry show at Petaluma claims the largest attendance of any similar function in the state.

Oroville has an ambition to be the olive center of the world, and from present indications will make good.

The demonstration train trip through the Sacramento Valley was a record-breaker in number of visitors.

One farmer near Suisun, Solano county, harvested fifty-four tons of tomatoes from two and three-quarters acres of land.

Rains have softened the ground at Pentz, Butte county, so that stock men are plowing and preparing for the planting of alfalfa.

The exhibit of Chico, Butte county, at the National Horticultural congress at Council Bluffs, Iowa, has secured six first and two second prizes.

The Sonoma County Berry Growers' Association has reorganized for the coming year, with J. J. Alves president and J. F. Lowary secretary.

A reclamation district has been formed in Siskiyou county which will bring under cultivation 8,400 acres near Etna and Fort Jones.

One co-operative marketing association in Sonoma county will handle during the coming year forty tons of loganberries, sixteen tons of Mammoth Blacks and seven tons of raspberries.

The rice harvested on the experimental farm at Willows, Glenn county, is of excellent quality, showing the long, clear kernel desired by rice farmers. Some difficulty is found in threshing, as the hull clings obstinately to the kernel.

Hayward, Alameda county, has in the last month canned over two hundred tons of pumpkins. Next year it is planned to more than double this amount, as the pumpkins are proving more profitable when prepared for pie-making than when used for stock feed.

A big force is at work rushing to completion the distributing system of the Orland Irrigation Project in Glenn county. It is expected that by the first of April water will be started through the canals and ditches. The completion of this system will bring 14,000 acres under irrigation.

Central California

Exeter's shipment of citrus fruits is in excess of 530 cars.

Kings county fish and game commission has released a number of Hungarian partridges south of Armona.

The San Jose Grange will hold a joint meeting with other county granges at San Jose on December 24.

A syndicate of Los Angeles capitalists has purchased lands near Delano which will be irrigated and subdivided.

The taxpayers of Turlock have voted bonds to the extent of $1,206,000 for the extension of their irrigation district.

Over 1000 dairy cows adjacent to Dinuba calls for the establishment of a creamery and steps are being taken to secure one.

Lindsay's orange shipping is nearly over and for the year ending January 1st it is estimated it will aggregate about 1322 cars.

Fresno's exhibit at the California Citrus Fair to be held at Sacramento in February will require five cars to transport it.

An effort is being made to extend the head of navigation on the San Joaquin river much higher up in the valley than it has ever been.

A mass meeting of raisin growers was held in Fresno last Thursday and plans were discussed for the new raisin warehousing plant.

The California Condensed Fruit Co. is contemplating a factory at Sanger for the manufacture of fruit syrups, catsups and canned goods.

Property owners should bear in mind that the state law passed in 1909 specifies that all lands shall be cleared of ground squirrels before January 31, 1911.

Riverdale Reclamation District No. 305, organized about a year ago, has brought suit against certain land owners to have an assessment levied declared legal and a lien upon the land.

There have been several battles between different factions of Fresno and Kings counties because of the building of the bridge by a railway over the Kings river.

The largest shipment of oranges ever made to a single firm from Tulare county consisted of fourteen cars shipped from San Francisco to Australia. The Australian demand is growing and promises a good market for California citrus fruits.

In his November report to the board of supervisors the livestock inspector of Fresno county announced that Fresno county is at last entirely free from the Texas fever cattle tick. For about a year the quarantined area has been confined to one township.

The committee appointed at the Stockton conference to propose amendments to the irrigation act is arranging for a meeting in the near future at Stockton to discuss changes in the law which will recognize securities of districts now organized as legal investments for banks, and other amendments which will make more saleable the bonds of irrigation districts.

Southern California

Huntington Beach sugar beet planters are already planting.

Mecca, Riverside county, is making its first large shipment of navels.

Anaheim irrigators are hoping to save water by cementing canals and ditches.

The cotton seed oil mill at El Centro hopes to be in operation by January 15th.

Some sections of Southern California are contemplating more liberal planting of olives.

Prof. Ralph E. Smith is again at work at the Southern California Pathological Laboratory.

This is not Southern California's dryest season, but it is dry enough that much concern is felt.

Antelope Valley farmers are finding excellent results in growing wheat under dry farming operations.

San Bernardino county horticultural commission is spending about $25,000 per month in fumigation work at this time.

Citrus growers are continuing their strenuous fight to secure reduction in icing charges where fruits are precooled.

Suit has been brought against the defunct Perris Irrigation District to recover $8000 due on bonds and interest.

Imperial Valley cotton growers have shipped about a dozen cars of cotton, sale having been made to the Oakland cotton mills.

Redlands orange growers have organized a fruit growers protective association. Over 3000 acres are covered in the membership.

Lancaster, Los Angeles county, is giving more attention to dairying, one of the largest dairy ranches having just been established.

Notwithstanding the biggest output of citrus fruits ever, prices are proving very attractive, even slightly in advance of last year's.

Orange county now anticipates another sugar factory between Santa Ana and Newport Beach and a 33-acre site has already been purchased for it. The plant will cost about $600,000 and will be ready for the 1912 crop.

The committee of seven appointed as the outcome of the Pomona Convention, has appointed a subcommittee of three consisting of A. F. Call, P. J. Dreher and G. Harold Powell, to present the needs of the citrus industry at Washington.

Five hundred carloads of brick, structural steel and other building material are to go into the construction of Anaheim's big new sugar factory. When completed it will have capacity to handle 600 tons of beets daily, and this capacity is to be doubled the second year.

The citrus association of Covina, Los Angeles county, has been selling fertilizer to all members at cost. At a recent meeting growers expressed themselves in favor of the proposed plan of having the California Fruit Growers' Exchange take over the fertilizer distribution business.

The Coast

Portland, Oregon, markets had offerings of home-grown raspberries at Thanksgiving time.

The annual poultry show of Walla Walla, Wash., will be held the week beginning January 16.

Farmers near Bowie, Arizona, are elated over striking a fine flow of artesian water at a depth of 490 feet.

Eastern fruit buyers have begun suit against growers and shippers for non-delivery of prunes at Albany, Oregon.

Spokane's Apple Show, which has been transferred to Chicago, is bringing many settlers to Eastern Washington.

The Oregon State Association of Butter and Cheese Makers met in annual convention at Eugene, Oregon, last week.

The holiday demand has cleaned up the bright red apples, and the Northwest Fruit Exchange is finding greater demand than it can fill.

Apple growers of Washington and Oregon are discussing plans for a more perfect fruit marketing organization for next year.

An asparagus grower at Kennewick, Washington, cleared from a twenty-acre tract over $16,000, and hopes for a $20,000 profit next spring.

The Hawaiian Islands have nearly doubled their output of sugar in the last ten years. Last year's output aggregated $55,000,000.

The Arizona Sentinel says: "The winter climate around Yuma is a thing so intoxicatingly salubrious that no words can describe it."

A woman at Phoenix, Arizona, has planted two acres to American Beauty roses, and is now exhibiting some magnificent specimens in the Los Angeles Chamber of Commerce.

The Yakima, Washington, Poultry Association will hold its next annual show at North Yakima the week beginning January 16. A fine line of silver cups is being exhibited.

Maintenance of the tariff on wool was the chief subject of discussion at the meeting of the Wyoming Wool Growers' Association, held at Sheridan, Wyoming, the first of the month.

Plans are under way for the formation of an association of the apple growers of Washington, Oregon and Idaho which shall have for its purpose the marketing of apples grown in the Pacific Northwest.

Oregon Agricultural College contemplates establishing a system of agricultural experiment stations throughout the state. Stations now proposed are in Southern Oregon, Harney Valley and Willamette Valley.

The poultry courses under the direction of the new instructor, Miss Lillian Blanchard, will be one of the new special features of the two weeks' farmers' course this winter at Washington State College at Pullman.

The Chief of Army Engineers recommends to the rivers and harbors committee of the House an appropriation of over two million for improvement in the Pacific Northwest, the bulk of this sum to be devoted to the Columbia river.

Coulson's
EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying powers and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the famous Coulson products and gives valuable information about Poultry Raising.

FURTHER HINTS ON BREEDING EXHIBITION STOCK.

By H. F. Mann, San Jose.

Some time ago I wrote an article on double mating of Barred Plymouth Rocks, and I have since been thinking I should like to write a short article on general mating and breeding.

Besides double mating for color, there are many things to consider in breeding. In breeding show stock of any kind, one of the most important things in breeding is type. We have recently sold Barred Rocks to the butcher because they were off on type, and it is too much of a waste of time to breed from birds that are too badly off on type, when we have plenty that are of good type.

Next of importance is size. We have also sent beautiful specimens to the block because they were under size. Some might advise you to take these off-type, undersized specimens and breed them up, which might have been good logic fifty years ago, but if you undertake that now, the other fellow will be breeding and selling good ones while you are wasting your time in trying to establish a breed. My judgment is that you had better buy a few good ones of whatever variety you wish to breed, and then go on trying to improve them, for there are defects enough to keep you busy thinking in the very best you can buy.

No doubt some have told you that it does not make much difference what kind of females you have, so long as your male birds are good, but we have found it impossible to breed show winners unless you have the females of just as high quality as the male. Then, in mating up your pens, look your flock over carefully, and where you see a defect in your males, make it up in your females if possible, and vice versa. Lay aside all fads of your own, and take the American Standard of Perfection, and strictly adhere to it as to color, size, type, and, in fact, all points given in the Standard. If you have any trouble in interpreting the standard as to color, ask some successful breeder to point out the ideal color to you. If you are breeding white birds, get them as white as the froth on milk; if buff birds, compare them to a piece of gold money; and if red birds, compare them to a red ripe cherry; if black birds, imagine them black, very black, with your green veil spread over them. If parti-colored birds, words written or spoken cannot describe the color; you must see the color before you know it. Then, above all things, don't try to breed what you like, but try to breed what the judges like—that is, what the American Standard says.

THE PERCHES.

If there is anything about the furniture of the poultry house that needs careful attention, it is the perches, or roosts. On these the hens spend over half of their time, and it is quite necessary that they be hygienic in every way.

So many poultrymen have such high roosts that the fowls, in jumping down, bruise their feet, and the disease known as bumble feet results. Others place their roost poles in a stair form. This causes all of the fowls to crowd to the top roost, and, of course, the weaker ones get crowded off, and some are crippled or killed.

To avoid this difficulty, place the roosts on a level, and only sixteen or eighteen inches high, then when the fowl alight from the roosts there will be no danger of injury to them.

The reason fowls like high roosts is that in their wild state they learned to roost as high as possible, so as to avoid their enemies. I would rather see roosts only eight inches above the floor than to see them four or five feet above.

The kind of roost pole is quite important. It should be free of any creases or cracks where lice may find a lodging place.

They should not be smaller than two or three inches in width or diameter. A two-by-four, made round on one edge and placed on edge, makes a very good roost pole.

The poles should be placed so as to be movable, that they may be taken out and cleaned once in a while. The handiest way is to make a low trestle, and let the roosts set in notches cut in them. Make them solid, but do not nail fast.—Wisconsin Agriculturist.

CULL OUT THE FLOCK.

Every year we are impressed strongly with the necessity of culling the flock early in the year. November is the month when the flock, as well as the houses, must be prepared for winter quarters. Weed out all of the very late-hatched birds and dispose of them, unless you have ample room and time to care for them in separate quarters, and then only spend time with those that are exceptionally good. Late-hatched birds, when given only the same attention as the rest of the flock, never develop into first-class birds, and usually catch cold, or, being weak, are a prey to some disease and endanger the rest of the flock. Dress them for market early. This will give the pullets ready to lay and the rest of the flock more room to get into condition. One of the greatest drawbacks to the average poultry farm is that too many birds are crowded into too small quarters. Fowls, to do well, must have plenty of room. This gives them plenty of fresh, pure air and plenty of chance to exercise. By culling out the poor specimens you will also have the satisfaction of knowing that your flock contains nothing but fowls of the highest standard of quality.—Wisconsin Agriculturist.

GRIT.

Because chickens and hens have the run of the farm is no reason that they are plentifully supplied with grit. Where hens have been kept for several years the sharp grit is very liable to be exhausted, for they search over every part of their range daily, and often several times a day, eying sharply every bit of gravel, earthenware or glass, frequently picking up and dropping pieces when they seem uncertain about their sharpness. They will accept almost anything for grit that they can swallow, if it is only sharp.

Grit is the teeth of the fowls, and without it they cannot masticate their food and prepare it for digestion.

The poultry yard may be made up of gravel of the right size, and yet the hens suffer because the gravel is not strong enough to wear when it gets to the gizzard of the hen—her grinding mill.

If a supply of sharp, strong gravel

More Inventions by Lee

Here's his new Incubator door all are talking about. Perfect ventilation for the *first* time.

Mandy Lee Incubators

supply life-giving oxygen freely to the eggs and just as naturally draw off the poisonous gases. The most important step ever taken in incubator ventilation—neither above nor below, but *right at the eggs*—the correct principle, for the new Mandy Lee is making better hatches of *stronger* chicks than any other incubator in the world.

We Measure Everything

Heat—moisture—ventilation. You *guess* at nothing. If the eggs are good and you follow simple directions your work with a Mandy Lee is as nearly an absolute certainty as anything can be. There is no more reason why you should buy an incubator that regulates nothing but heat than for a farmer to continue to harvest his crops by methods and machinery used 100 years ago. Your success with poultry depends on your ability to select equipment that is *right*—that's what you *always* get from us.

No guessing with a Mandy Lee

To the Poultry Raisers:

Do you want sick, mopey chickens, or do you want strong, healthy ones?

Above are the kind of healthy chickens found on a ranch where Merval is used. Why not give your chickens Merval and have strong, healthy birds like these?

Merval will cure Roup in a week, and other diseases such as Canker, Chicken Pox and Diarrhoea in ten days.

Merval is also a fine tonic for run down hens. It puts them into condition again, which means more eggs.

Get a can from your dealer today. If he does not sell Merval, send us one dollar and we will forward you a one-pound can, postage paid.

Do it now. Remember, Merval won't cure dead birds.

cannot be found in the natural pit, it must be provided from other sources. Poultry supply dealers sell crushed granite and quartz, and we keep it constantly before our birds, both chicks and hens, and are very certain that it is the cheapest and best substance we can get. There are two sizes, adapted to young chicks and fowls.—Wisconsin Agriculturist.

THE HEN HAS NOT LEARNED.

There is considerable to be extracted from poultry culture besides dollars and cents by the keen-eyed observer. True, the ordinary hen isn't so very interesting, but did you ever stop to study why any hen when a bunch of tender green stuff is given her proceeds to act like a simpleton in her endeavor to eat it? Instead of placing one foot on the green stuff to hold it fast while she pecks leisurely at the remainder, she will toss it wildly back and forth with beak as if she only possessed that one weapon of attack. Yet she will scratch like a fiend in the mellow garden soil, or on the soft turf of the lawn. All instinct, nothing more or less. The original hen acted in this way and so the hen of today does the same, just as the dog of today turns round before lying down because the wild dog of ages gone had to make this movement in order to form a bed of brakes or rushes for itself.

"My flock of Buff Wyandottes are great pets, and their house being next to my workshop, I have chances to watch them very often. Frozen chickweed is a favorite winter food with me and I have noticed that the hens will toss it about, throwing it over their heads and working hard to try to tear off a piece, instead of standing on it with their feet and so easily pulling it apart. It makes me nervous to see them "muggle' an undertaking so obvious. Now, in truth, the race of hens have always found their green food fast at one end, and so it has not become an instinct with them to stand on their food while pulling it apart with their bills, as is done by crows, hawks, eagles, owls, etc.

"What the race of hens has not learned to do by instinct apparently individual hens cannot learn. How long do you suppose would it take the race of hens to learn to stand on their food while eating it, provided all the food fed to the hens was in the form which made standing on it necessary? Judging by the intelligence of hens and by the tenacity with which they cling to acquired instincts, neither you nor I would be here when they had acquired this new instinct."—Julian Burroughs in Forest and Stream.

LARGE FLOCKS.

While a small flock may afford pleasure, because every member of the family becomes interested in caring for the fowls, large flocks demand labor. The actual cost of the food for each hen differs but little from that required for a small flock proportionally, and the profits are estimated by the difference between the cost of food and the receipts, when in fact the value of the labor is greater than the cost of the food in many cases, which puts a different aspect upon the enterprise. When the owner performs the labor himself he receives the price of that labor in the receipts.—Coleman's Rural.

The chicken is strongly influenced by habit. When raised in the chicken house no trouble is experienced in getting it to roost there.

FATTENING YOUNG ROOSTERS.

Answering an inquiry as to feeding young roosters, Wallace's Farmer says:

We have found it difficult to fatten a single bird by itself. If we wish to fatten one or two older birds, we put some half-grown chickens with them for company, and give a colony coop large enough to give a moderate amount of exercise.

Where one makes a business of fattening, crates with partitions giving each bird a stall should be provided; each stall having an opening in front and back of crate for cleaning out the droppings. We advise more room for a few chickens because unless arrangements are made for cleaning a small coop quickly and conveniently, it gets too filthy, or requires too much time in keeping it clean. The important thing in fattening is to feed enough, to feed regularly, and to kill the bird before it "goes off its feed" and loses flesh and quality.

If grain is scarce, better keep only a few hens, and feed them well. A laying hen requires plenty of food. Boil the vegetable parings each day, add table scraps, and enough ground meal and bran to make a mash. Feed a quart or more to twelve hens each day, give about a pint of wheat or oats in litter at noon, and at night a quart of wheat, oats or cracked corn. Keep them busy.

DRESSING A GOOSE.

To kill a goose, make a quick, sharp cut in the roof of the mouth below the eyes, or stun by a sharp blow on the head and then make the cut for bleeding.

The feathers are assorted while picking. The picker uses a box about the height of his knees, and holds the bird with the left hand, clasping the feet and wings together, and holding the head of the bird in place with the knee.

If the bird is to be scalded, use the same temperature of water as for a chicken, but dip several times, placing the back in the water first. A common practice is to wrap geese in a blanket after scalding to loosen the feathers, but the steaming must not last long enough to cook the flesh.

Do not dry-pick geese for the feathers before killing, as this causes the skin to become inflamed; and do not singe to remove hairs, as the heat gives the carcass an oily, ugly appearance. For market purposes, leave the feathers on the head, neck, wings at first joint, and tail. Pick the feathers from the body of the bird, then moisten the hand and rub the body to remove down. Geese are drawn like other poultry.

Poultry of all kinds, if dressed for the table, looks better when plumped by putting in scalding water for about ten seconds and then in clean, cold water—the colder the better.—Wallace's Farmer.

Here is a novel way for preventing fence flying: Take good strong string, and tie a knot about three inches from the end; then take the end nearest the knot and put it around the tip end of the one wing, and tie a slip knot below the knot in the string, so it cannot pull up too tight on the wing. Then pass the other end of the string under the other wing, and have it just loose enough so that the chicken can keep its wings folded naturally, and tie the same as other end. After it has been on about six weeks the string may be removed, and your chicken will stay in just as though it had never flown over a fence.

Hoyt, Santa Rosa. **Association**, $5 for best display Ornamental Bantams, Henry Hoyt, Santa Rosa. **Association** trophy for best collection ducks, Vincent Huntley, Petaluma. **Association** trophy for best collection turkeys, Ed. Hart, Clements.

Petaluma Courier trophy for best display in novice class, Duncan Lee, Petaluma. **Association** trophy for best display any recognized variety not yet admitted to American Standard of Perfection, Goodacre Bros., Compton. **Association** trophy for best display Cornish Indian Game, Richard Keatinge, Palo Alto. **Association** trophy for best display Bantams, Hehry Hoyt, Santa Rosa. **Association** trophy for best collection geese, William Hirsch, Irvington. **Association** trophy for best display Silver Penciled Wyandottes, Mrs. George Grindell, Haywards. **W. S. Sullivan** trophy for best Buff Orpington birds raised from his eggs or from stock, R. A. Kingman, Petaluma.

The National Single Comb Buff Orpington Club held its Western Branch meet at the rink, and offered prizes for competition by the members only. Handsome cup for best cock, cockerel, hen, pullet, pen and display. Cock, R. A. Kingman, Petaluma; cockerel, W. S. Macy, Santa Barbara; hen, W. S. Sullivan, Agnew; pullet, W. S. Macy, pen, W. S. Sullivan; display, W. S. Macy.

HENS KNEW THEIR BUSINESS.

There is a German dairyman and farmer whose place is not far from Philadelphia who greatly plumes himself upon the absolute superiority of his products above all others in the vicinity.

On one occasion he personally applied to a Germantown housekeeper for a transfer of her custom to himself. "I hear dot you haf a lot of drouble with dot dairyman of yours," he said. "Yust you gif me your gustom and der vill be no drouble."

"Are your eggs always fresh?" asked the woman.

"Fresh!" repeated the German, in an indignant tone. "Let me dell you, madam, dot my hens nefer, nefer lay anything but fresh eggs?"—Rural World.

A surprisingly large quantity of poultry coming to market is not fasted before killing, and often arrives with crops full of food and protruding. This distended crop is decidedly unsightly, and perceptibly lowers the appearance of the birds. Why will not people learn that a bird's crop gorged with food is a handicap to its sale. Moreover, it distinctly lowers the quality of the flesh as well. It has been demonstrated that the flesh of poultry that fasts for from twenty-four to thirty-six hours before killing is more delicate of flavor and of better keeping quality than those which have food in process of digestion at time of killing.

Max Muller, one cold winter day, reviled his fowls, that did not lay, blasted pullets and cussed the cocks, anathematized his numerous flocks, and vowed he'd sell them all for soup, for lack of business in the coop. He'd fed them oats and fed them wheat, chopped-up barley and scraps of meat, condition powder and oyster shell, all the diet they liked so well. He'd used trap nests and all of that—they just laid 'round and put on fat.

For canker in fowls, the following remedy is recommended: Mix 12 drops carbolic acid, one teaspoonful laudanum, 10 cents worth sugar of lead, five cents worth sulphate of zinc, and one pint of water; shake well. Open up the nostrils with a broom straw, and with a small glass syringe inject into them the mixture, three times a day, and put eight to ten drops in the mouth. Feed soft bran and give plenty of water.

Pullets cannot mature rapidly when half fed, and must be fairly fleshy before they will begin to lay. This is the reason why the owner should pick up the pullets once in a while and handle them over to see whether they are fleshy or not, and also to see if they are troubled with lice. A pullet troubled with lice will not lay early. If they are troubled at all, they should be attended to at once.

Hardy parents beget hardy offspring. If we neglect in this particular, each succeeding generation will be more delicate. No fowl should be used in the breeding pen that has had a case of serious illness. No matter how sure we may feel that full health has been restored, there is still some taint of disease remaining in the fowl which will be inherited by the young. Inbreeding has caused more weakened constitutions than anything else we know of.

The poultry business is no longer a mere matter of rearing a few fowls in an old tumble down building, in a careless, slipshod way, nor a matter of experimenting with fancy breeds by a limited number of enthusiasts who enjoy pursuing a "fad." The business is a national industry and adds each year millions of dollars to the produced wealth of the country.

It will always pay to have a place to coop and feed for a week or two all fowls intended for market. They take on flesh very rapidly when cooped and fed all they will eat, and the flesh is of better quality. Indeed for one's own table it would be profitable to keep a few in the fattening pen at all times; then there would be no trouble catching one on short notice, and no doubt about the fowl caught being fat enough to kill.

It is much better to buy a ready-made incubator than it is to buy plans that tell you how to make one. Not all of us are carpenters and tinsmiths, and it is a difficult thing for any one else to make a successful incubator, no matter if you have complete plans to follow. If you desire to practice your hand at carpentry do so in the making of good chicken coops, rather than on incubators and brooders.

Irrigation and Forestry

THE SCIENCE OF IRRIGATION.

"Had I irritated the vines once more I would have raised enough taters to consume the family," is the way an old-timer, in one of the fertile valleys of the Colorado river, complained at not having all the water he wanted for irrigating purposes.

His language was a little mixed and so was his mind. For his crops did not need more water but better cultivation. The potato contains a good supply of water but it insists on having that come in the form of soil moisture. That is conserved and properly distributed by using right methods in tilling the soil.

An eastern farmer located in the Okanogan valley of Washington, had decided to plant a crop of potatoes. It was necessary, for the family needed potatoes. The land was not irrigated, for the reason that no canal had been constructed to carry water to the field. The soil moisture was that held, by the earth, from rain and snow of winter.

The settler plowed the land and planted the tubers. He had this much assistance—soil with plenty of plant food, moisture, stored near the surface—and sunshine, coming from over the mountains. When the seed was planted the farmer began harrowing the surface of the earth. That caused some of the natives to wonder what he meant. When the plants showed above ground the harrow was dragged over them. Then the old-timers collected in groups and talked about the man and his harrow.

Six or eight times during the season from planting to blossoms, the potato crop was given surface cultivation. Then came the surprise. For at digging time, the tenderfoot had the best crop, finest quality and most perfect specimens of potatoes grown in that section. He did not wait for rain or water to irrigate the vines. He cultivated in the dust and sand and assisted nature in giving out the moisture she had conserved.

Go out in the open market and buy two bags of potatoes, shipped from an irrigated district. Put them to the test, by cooking in any of the many ways of preparing the tubers for food, and notice results. One will be mealy, fine and tasteful. It came from the field where the man had learned the art of applying soil moisture at the proper time. That man communed with nature and catered to her desires. He studied the soil and its composition for the purpose of reaping profits from his labors.

The second bag of potatoes does not give satisfaction. The tubers do not look just exactly right. Small growths show imperfect maturing. The cooked tubers are sad and blue. The cook wants no more of them and says they are too watery. And there is something wrong with the flavor. Those potatoes came from the same section as the other bag, but they were grown by the man who plants and waters his crops. He gives no thought to nature or her requirements in moisture and cultivation.

To succeed, in an irrigated country, the farmer must be a man of good business judgment. It is not necessary that he should be a class graduate from some commercial school, or be familiar with the theories of teachers in political economy, in musty college halls. But he cannot grasp the full measure of soil wealth without careful and studious labor. That explains why townsmen often fail in attempts at developing farms. Irrigation cannot be handled by any system of absent treatment.

Man is master of the situation when he enters into partnership with modern irrigation. Nature recognizes his superiority and comes to his assistance. She wants a husbandman who will give her a chance to make a creditable exhibition of the results of the wedding of such personages in the world of production. If man fails to perform his part of the work nature will show her resentment of such treatment in inferior crops, worthless weeds and other signs of shabby abandonment.

Comparisons are generally odious but not objectionable when used to illustrate the difference between failure and success. For that reason two farmers are brought to the front in this paragraph. One had a large tract of land, with plenty of money to develop the alfalfa industry. He lived in town, spent much time at nickel-in-the-slot machines, and let the water run, in plats, surrounded by dams. He cut and stacked an average of less than six tons of hay to the acre.

In the same community a practical farmer, living on the land, had several acres planted to alfalfa. He irrigated by the furrow method and kept himself busy to see that the water did not form in ponds or wash out the plants. He harvested an average of more than ten tons of alfalfa hay to the acre. And his hay was worth more to the ton than that which was grown under varying conditions of surplus water and crusted earth. One man studied the needs of the soil and the other criticised the newest brands of cigars.

There is such a thing as excessive moisture, even in the land of irrigation. Passing through a ten-acre field of corn I noticed that in the center of the field the ears were well filled, the stalks perfect and the growth natural. At the end of the rows, next the irrigation main, the stalks were short and yellow and many had not even poorly formed ears. At the bottom of the field, where a waste ditch should have been dug, to carry away the surplus water, the corn was almost a failure. The lesson is plain enough.

If rows are too long the crops next the main get too much water because of it having to remain too long in the furrows. No crop calls loudly for water at its roots. Moisture is what plants require. That should be given and the irrigation brought to a close. Measurements of the flow of ditches, passing to given areas, have shown that the land received as high as 70 inches of water, during the growing season. That was about three times the amount required to make good crops. It did not benefit the plants and certainly did damage the soil.

One year I had a patch of corn fall down and waste because of too much water. That was before I had learned, by practical experience, the duty of water and the demands of the soil for moisture instead of water. On examining the roots I discovered that they did not branch out but formed a wall of defense, much like oyster tongs, trying to protect one another from the attacking storms of water, poured forth every ten days. A few rods away the corn stood up and sent out rootlets far above the surface. They were grown under normal conditions, and went out in all directions, seeking moisture.

Utah is revered as the mother of irrigation. It was there that the pioneers of many months on the desert cast anchor, and staked claims on the shores of Salt Lake. They arrived late in the season—July 24, 1847—but not too late to plant crops. A plow furrow led the waters of City creek out upon the land. That was rich in potash and phosphoric acid and had been collecting fertility for centuries. It required only moisture and cultivation to make it produce crops. And they grew and made a city, county and state.

In one of the isolated districts of Utah, known as Grand valley, is a pioneer, whose fruits are exhibited at the state fair every year and his name is often heard among those seeking success in irrigation. That man is O. W. Warner. He was the first settler in Grand Valley. A quarter of a century ago he drove his team with a wagonload of fruit trees and family, into that promised land. An irrigation canal was plowed out from Pack creek, and the work of starting a home framed for action. Nature had done all she could and awaited the assistance of man.

Years came and went in the history of time and that man prospered. Neighbors entered the valley and new farms were made from the desert. Finally he erected a magnificent residence, said to have cost $9000. Then people began to wonder how much could be made from a small farm, such as he commanded. For only the level land, that could be irrigated, was held for cultivation. The surrounding hills remained in their old desert condition.

A local paper published a statement of assets, made by the pioneer of that valley. It was interesting because it showed the possibilities of irrigation and the cash opportunities for others in developing arid lands. The tract consisted of 74 acres. From that he sold peaches, apples, pears, grapes, wine, plums, apricots, barley, wheat, oats, corn, potatoes, alfalfa seed, honey and live stock valued at about $8000 for one year. At that rate what

would be the market value of 74 acres, from which the crops were produced?

Many lessons were brought out in the work of that pioneer. He had a surplus of something to sell every day in the year. His hobby was not any one thing but to produce the most and best of all things the land would permit. He might have been seen almost every day, except Sunday, in the fields, with others, cultivating the earth. The matter of irrigation did not receive so much thought, for it was merely one of the combination of forces in successful soil handling, that did not need application until crops called for moisture.

This is a pioneer story because all of the West has not been settled yet and there are hundreds of places for the pioneer to enter upon virgin soil and develop its possibilities. But there are other reasons for writing pioneer stories of irrigation. For while one man succeeds in handling the gifts of nature another fails and the lessons are to be taken from the successful farmer. Nothing can be learned from the man who is a failure in his life work. He simply stands out as a living monument to warn others not to follow in his footsteps, because they might lead to the same landing on the shore of time.

An example of failure may be cited in the history of this man. He located on 160 acres of flat, sandy bottom land. The entire tract, with the exception of a few rough spots, was put under cultivation. A wire fence enclosed the place and kept out intruding stock. It was planted to alfalfa, grain, potatoes, beans and corn. But the man did not make a financial success of the venture. He gave all his time to irrigation and had no opportunities for cultivation. The crops failed to give profitable returns for the reason that only one element of production was noticed, that was irrigation, and without the others in the combination, it was a bar to successful dealing with the soil.—National Irrigation Journal.

NATIONAL FORESTS.

For the fiscal year ended June 30 last, the United States Department of Agriculture announces the 25 per cent, of National Forest revenue which will go to the states for road and school purposes amounted to $506,194.84. This was $67,492.03 more than last year, or an increase of a little over 15 per cent. The payments are an offset to the loss of income from taxable property sustained through withdrawal of the forest land from entry under the public land laws.

The amounts which will go to the various states are as follows: Arizona, $51,229.38; Arkansas, $2,904.44; California, $60,752.91; Colorado, $50,506.19; Florida, $706.38; Idaho, $66,074.55; Kansas, $1,004.67; Minnesota, $457.37; Montana, $83.678.38; Nebraska, $2,820.25; Nevada, $16,314.33; New Mexico, $28,529.53; North Dakota, $63.64; Oklahoma, $626.10; Oregon, $39,635.87; South Dakota, $9,808.93; Utah, $32,905.49; Washington, $23,671.89; Wyoming, $34,704.54.

Noteworthy is the especially heavy increase over the amounts last year in certain States. In California the amount rose by over 25 per cent, in Idaho by over 35 per cent and in Oregon by nearly 50 per cent. The increases are the result of increased activity in National Foest timber sales in these states and are an earnest of what will happen as the timber supply which the Government is caring for comes into full demand. Since the cut of timber will always be limited to what the forests will keep on growing, the income to the states will be permanent, not transitory, as would have been the case if hasty and improvident exploitation had been permitted. According to the calculations of the Department of Agriculture officials, the states will eventually receive many times what the forests are now yielding them, for there is as yet on the whole only a very restricted demand for the Government's timber.

GREAT CO-OPERATIVE IRRIGATION PROJECT.

The greatest and most successful co-operative enterprise in the state of California, perhaps not surpassed in the world, is that presented by the Modesto irrigation district, of which the city of Modesto is the center. This enterprise, which in a few years has converted 100,000 acres of land from biennial grain fields to perennial alfalfa fields, vineyards and orchards and added $15,000,000 to $20,000,000 to the market value of the lands embraced within the district, is at the same time the most significant industrial development of the state, its influence far reaching. It comprises one of the greatest irrigation systems in the world, constructed by the land owners themselves at a cost to date of about $3,000,000, and is owned in perpetuity by the land. It is not owned by the land owners, for the irrigation right and use attaches to the land itself and cannot be alienated.

This irrigation system consists of a diverting dam of concrete masonry and 300 miles of main and lateral canals. Fully 256,000 acres of land shares equally in the ownership of the system.

This land lies in the bed of the San Joaquin valley, in that political division known as Stanislaus county, at the northern end of the valley. The soil is sedimentary, a sandy loam. For 30 years it was farmed exclusively to cereals, the average rainfall of about 10 inches prohibiting other crops. Appreciation of the possibilities of development under irrigation and the presence of an unsurpassed water supply at the door in the Tuolumne river led to an agitation late in the eighties that resulted in the organization of the Modesto and Turlock irrigation districts. It was not until 14 years later, however, that any portion of the works was so far completed that irrigation became possible. From that time there has been a large and steady influx of settlers, 100,000 acres are now under irrigation, new towns have sprung up, old towns have doubled and trebled their population and evidences of prosperity and development abound.—National Irrigation Journal.

Irrigation means intensive cultivation. To make irrigation a success, three requisites are needed, soil, brains, and water. If you have the soil, which is important, the crop will be productive. With regard to the brains—more brains and less water should be the slogan. More failures result from too much water than from a deficiency of water. Many times the irrigation farmer forgets that in order to have good irrigation, he must have good soil drainage. The U. S. government drainage engineer told the editor the other day that there were over 800,000 acres of irrigated land that had been ruined by applying water too freely, and the question now is, how to regain those acres by a good system of drainage.

Deep Well Pumping For Irrigation.

The past season has demonstrated more than ever the practicability and superiority of the Pomona Deep Well Pumps. It is fully proven that it is possible to lift large quantities of water from very deep wells with a surprisingly small amount of power. It has usually been considered that a plunger pump is only good for a 35-inch stream on a lift of say 200 feet, but the Pomona Manufacturing Company have demonstrated that it is no longer necessary to use a centrifugal pump, with its wasteful usage of power, to get a large quantity of water out of the ground, as this company is manufacturing extra large size cylinders including 12, 13, 14 and 16 inches in diameter, and capable of lifting from 50 tc 100 miner's inches of water. Not only that, but they are prepared to go down after it to depths of 300 and 400 feet if necessary.

They have one plant at Claremont where the water stands 390 feet below the surface and the pump has a total lift of 450 feet, delivering 45 miner's inches of water with 60 H. P. on the motor, and doing it easily. There is another plant in Ontario lifting 60 miner's inches 300 feet with a 60 H. P. engine.

The parts below the surface have been so perfected that they are perfectly reliable and are giving as little trouble as it is possible for a machine to do. Other pump makers, noting the wonderful success of the Pomona Pumps, are trying to imitate them, promising something just as good, but they are only imitators and have not the knowledge or ability to make their claims good.

The Pomona Manufacturing Company has a large plant at Pomona, the only one in Southern California, devoted almost exclusively to manufacturing Plunger Pumps. They are a reliable establishment and are here to stay, to make good their guarantees and to supply your wants in the way of extras or assistance. Their machines and apparatus have been tried out and their value fully demonstrated.

Anyone needing pumping machinery should send to them for catalogs, or visit them in person.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Glass Bells.

Where may I secure glass bells to hasten growth of vegetables in early spring?—Subscriber, Bell Flower.

We think any seed house advertising in the Cultivator can supply you. We think the cost prohibitive from any economical standpoint.

Almonds.

What is the cause of my almond trees dying? Some are two and some three years old. Part of them started out in the spring. Can you tell me the cause and what I can do to keep the replant from dying also? Our soil is a deep granite and well drained.—Subscriber, Roseville.

This is one of the cases where not enough particulars are given to make up an intelligent answer. The querry was submitted to one of the best almond growers in California, and he answers that he is unable to offer solution.

Alfalfa in Peach Orchard.

Is it advisable to grow alfalfa in peach orchard? Trees were planted four years last spring. Will alfalfa irrigation affect the trees?—Subriber, Fowler.

The peach trees will not do as well with the alfalfa as they will without. It has been shown that an orchard covered with sod produces 40 per cent less fruit than by clean cultivation. This may not be the case where alfalfa is grown and an abundance of water supplied, but the returns for fruit will be less. The frequent irrigation would tend to make the fruit softer and not good for shipping, neither would it be so good for drying.—J. B. N.

Fencing Against Gophers.

How deep will it be necessary to dig to put in planks or cement or wire to fence against gophers and moles which come in from adjoining lands? They come to my place by the dozens from surrounding lands which are unimproved. I am using traps, but it is such a continual fight that I would like to fence against them if possible.—Subscriber, Santa Barbara.

We imagine it would be necessary to go down two feet and that fencing to such depth would prevent the encroachments of the pests. We will ask our subscribers to give of their experience. It must also be borne in mind that the gopher travels long distances above ground to find new "pastures."

Fertilizing Peas.

On very light, sandy soil how much nitrate of soda, potash and superphosphate should I put on a row of peas fifty feet long?—Mrs. A. C. D., Bell Flower.

We would put 1½ pounds of nitrate of soda on the row and be sure not to get too close to the plants. Scatter or sow in strip two feet wide each side the row. We would try this without the potash and superphosphate, and think results will be satisfactory.

Almonds.

What kind of almonds is best for this section? Where can I buy the trees? Have reddish soil excellent for oranges. How long before they begin bearing; how long do trees live; how about irrigation and general care?—Subscriber, Lindsay.

We would not plant almonds in your section, especially on land well adapted for oranges. As to time of planting and general care, follow the same plan that you would with peaches except that almonds require somewhat less irrigation. The blooms come very early and will stand but little frost, and unless your section has proved itself adapted to these nuts, we would experiment before planting extentively.

Pecans and Filberts.

Will pecans and filberts do well around Riverside?—Subscriber, Magnolia Avenue.

We do not think we would plant these nuts in Riverside. Trees grown in the section, however, are the best answer to that question. The pecan has proven especially well adapted to all parts of the South where there are cheap lands much closer to the market, and we imagine California's high priced land could be used more profitably in some other fruit.

Walnut Scions.

Is it good practice to take scions from a walnut tree which is grafted on black stock?—G. B., Gridley.

The stock would have no influence whatever on the quality of the scions, at least as to changing in any way the character of the nuts.

Peafowls.

Where can I secure peafowls and guineas, and what is their cost?—Subscriber, Santa Maria.

This question is often asked of the Cultivator and we refer it to our subscribers who may be breeding this stock.

Chicken Manure.

What is the best way to use chicken manure as fertilizer?—Subscriber, Bakersfield.

Apply as soon as possible to the soil and work under. This is the surest way of preserving all the fertilizing properties. It is claimed that it should not be allowed to dry. If it is not put upon the soil at once, compost so that it will not lose any value through leaching away by the rains and otherwise.

Fertilizer for Walnuts.

Can you recommend commercial fertilizer for walnut trees? Vetches and peas are desirable, but owing to the gathering of the crop and the lateness of rains, especially this season, it has been impossible to plant in time to get a season's growth. Land is black adobe, and if possible to get an honest grade of fertilizer. will use it. Trees are about 17 or 18 years old.—Subscriber, San Jose.

Our subscriber must bear in mind that commercial fertilizer to do well must be applied to a soil in which there is plenty of humus, for no matter how rich a soil may be in the elements required for plant growth, humus is requisite for proper bacterial and chemical action. If vetches and peas will not grow owing to the short cool season, we would recommend the use of rye. It grows rapidly in the cooler weather and supplies a vast amount of humus, though of course it has no value as a nitrogen gatherer. The acids it supplies to the soil, together with the mechanical conditions created, fit the ordinary commercial fertilizer for the use of the roots. We would recommend also that in February or early March you make an application of 200 to 400 pounds per acre of acid phosphate

California Cultivator Clubbing Price List

FOR THE SEASON 1910-'11

Prices are Good to Oct. 1, 1911

This magazine price list is prepared annually for the convenience and benefit of Cultivator subscribers. The prices given allow our readers the benefit of the lowest figures possible, in return for which, all we require is that to all orders a year's subscription to the Cultivator (class 18) be added at 90c (regular price $1.00 per year).

This year the pricing of various combinations of magazines is a simple matter; all are listed according to class number and this class number multiplied by 5 gives the cost price.

EXAMPLE:

Class No.		Regular Price
20	American Magazine	$1.50
16	Delineator	1.00
37	World's Work	3.00
18	Cultivator	1.00

91X5=$4.55. Club price for all. Amount saved on this club, $1.95.

We desire to especially call attention to this complete list of the most popular magazines. We can, however, supply any periodical published, at the lowest price, and any not listed here will be quoted on request. Let us make you a price on any combination you may desire.

Periodicals in any combination may be ordered to the same or different addresses. Foreign or Canadian subscriptions are extra on account of added postage and prices must be gotten by correspondence. Subscriptions may be either "new" or "renewals," but it is important that this information be given in each case.

Books—Send us a postal for our list of agricultural books which we supply subscribers and which we recommend as most suited to California conditions.

Don't overlook this special:

The California Cultivator (weekly)
The Rural Californian (monthly)
Both one year for $1.50

Our Money-Saving Combinations:

The price of the Cultivator and any single magazine may be obtained by adding 90c to the class price of the magazine desired.

Make up your orders from the following, noting that the class numbers multiplied by 5 gives the cost price. **Also bear in mind that all orders must include a year's subscription to the Cultivator (class 18) at 90c.**

The Cultivator Publishing Co.
115-117 N. Broadway
Los Angeles, Cal.

which carries 17 or 18 per cent of available phosphoric acid. Apply this before plowing so as to force as deep into the soil as possible. With heavy chain force under as rank a growth as can be secured from the rye and then apply on surface, say 150 pounds per acre of nitrate of soda, which cultivate thoroughly, then later, say in April, apply another 150 pounds nitrate. We think our subscriber can depend, if he wants to use commercial fertilizer, on the quality as indicated by the analysis which must be given with every package. The Fertilizer Control at Berkeley can inform him as to the worth of the goods he has purchased, and will make only a nominal charge. If perfect confidence is not placed in the fertilizer vender, that will be the safest procedure.

Pomegranates from Seed.

Will seed of pomegranates bring fruit of same quality as the parent bush? If so, when is the best time to plant? I recently secured a large red pomegranate weighing three-fourths of a pound. The outside skin was blood red and the pulp a much deeper red than others growing in this vicinity.—Subscriber, Chino.

We think any nurseryman can supply our subscriber with rooted plants of the red pomegranate which will probably grow as good fruit as the one mentioned. They do not come true to seed and are usually propagated from cuttings. If cuttings can be had from plant which bore this fruit, it will produce fruit like the original, will bear more quickly and be more desirable.

Possibly Mealy Bug.

I have a solanum jassminoides of very luxuriant growth on east side of dwelling. I note what I think must be cottony cushion scale on under side of vine against the house. What can I do to destroy it?—K. C. M., Los Angeles.

We fear this is not cottony cushion scale but mealy bug, which is almost impossible to eradicate, but the infestation should be destroyed, even if necessary to destroy the plant before it escapes to other growth. If it is the cottony cushion scale, we would recommend our subscriber to write to J. W. Jeffrey, State Horticultural Commissioner, Sacramento, for colony of novius cardinalis which will handle it perfectly.

It may not be necessary to destroy vines if they can be sprayed with carbolic spray advised by Mr. Essig and formula for which is given in the Cultivator of November 3rd, or the F. & G. Spray advertised by the Western Wholesale Drug Co., of Los Angeles, can be used.

Red Spider on Almonds.

I have 30 acres of almonds 13 years old not doing well and making little growth the last three years. The leaves turn yellow and fall during the summer. Have been badly infested with red spider for years. For this I have done nothing as I find it hard to sulphur big trees and a neighbor who does sulphur has trees but little better than mine. I think trees should be sprayed but wish fuller information. Where can I secure a spraying machine and what will it cost?—Subscriber, Esparto.

In spite of the neighbor's experience we believe this inquirer should proceed against the red spider with the sulphur treatment. The big power dust machines will send sulphur and lime mixed to the tops of the tallest trees and do it very rapidly. With as big an investment as 30 acres of 13-year old almond trees, this slight additional expenditure should certainly be incurred in the effort to secure best results. The small handpower machines which we fear would not be satisfactory for this use may be had for $15 and up. A power machine which will send the spray to the tallest fruit trees may be had for not less than $100. An engine to run it would probably cost $150, although a cheaper engine of 2½ h.p. would answer.

As to spraying during the present season while the trees are practically dormant, with a liquid spray, we could not tell without seeing the trees, but would judge that a thorough application of the sulphur-lime wash would be wise. This wash may be purchased of Cultivator advertisers or it may be mixed according to formula appearing in our issue of November 3rd. The machine for spraying is more expensive. A power machine, including truck on which it is hauled, will cost about $300 to $350, though we believe some cheaper ones are on the market, and a large size hand pump will answer for this work.

Nitrate of Soda Blood Meal.

Which is to be preferred, nitrate of soda or dried blood, the price of nitrate being equal, for application to late cauliflower for pickling, planting to be June 1st, matured crop to be gathered about September 20th?—W. L. J., Birch Creek, Utah.

Answer to this question depends upon various factors. In California citrus groves where instant action is wanted and in cool weather when the nitrifying bacteria in the soil are less active, the nitrate of soda gives this instant action. It must be borne in mind that while the dried blood contains nitrogen, it requires certain chemical changes in the soil before its plant food is available for the rootlets. On the other hand, it carries into the soil a quantity of humus which nitrate of soda does not. We note our inquirer does not intend to plant until June, so we take it the ground will be warm and active and in proper condition to make available the dried blood. This would rather incline us to prefer the blood. Also, regarding the use of nitrate of soda alone the alarm has been sounded that its use in quantity may result in the carrying into the soil of a sufficient amount of soda to make its alkaline action injurious to more delicate plants. This, however, will depend upon the nature of your soil, drainage and other factors.

Redwood Shavings.

Recently your paper contained an interesting account of the result of putting redwood shavings on the soil of a citrus orchard. But the article failed to tell us the reason for the harmful effect upon the trees.

The resin in redwood and which gives the wood its color is poisonous to plants and seeds. In testing the germinating power of seeds by using a block of wood to hold seeds between blotters above the water in which the block floats the precaution must be observed never to use a block of redwood. If redwood is used the resin discolors the water and always kills the seeds which are being tested.

Evidently this resin has the same effect upon the tender root hairs of the citrus tree. F. H. B.

HANDS UP.

Eleanor, aged six, had been going to school only a few weeks. She had learned to raise her hand if she wanted anything. One day she put this into effect when she was sent to the chicken house to get the eggs.

Just as she reached the chicken house door her mother heard her say: "All you chickens that have laid an egg, raise your hands."

Bees and Their Care

RECLAIMING THE SWARMS.

We have been shinning up trees to get swarms. You may wonder why we did not pursue the good old orthodox plan of having the queens' wings clipped, or why the colonies had not been shaken, to stop all of this unnecessary climbing and chasing. In the first place, some of our customers object to having their nice queens clipped—don't like the looks of them. In the second place, the swarming weather caught us by surprise. We had about given up having any honey-flow, and the problem had been to keep our bees from starving. But the season opened up and the bees swarmed, and how should we get them out of our tall basswoods? No way under the sun but to climb after them. We used a jack-knife to cut off the limb on which the swarm hung, then by carefully dodging among the limbs we climbed down to the ground as best we could, handing the swarm to an attendant as soon as he could be reached. But the jack-knife in cutting jarred the limb.

I finally took down a big pair of pruning shears, two big potato sacks, and some stout string, supplying the boy who did the "shinning" with all these before he went up the tree. The shears were handy for clearing out a space through which to let the bees down. After reaching the swarm, the boy would proceed to slide the bag up around the bees. Then he would grab the neck of it around the limb, and with the pruning shears slip it off. He would then with his rope let down bees, limb, bag and all, or he could climb down without danger of jarring the bees off or without any fear of being stung. In descending through the tree, holding a limb from which a big swarm is hanging, one is liable to bump it against the foliage, dislodging many of the bees, filling the air full of them. These will in all probability alight on the limb nearest where they were first clustered, with the result that another climbing is necessary to get all the bees. The coffee sack or bag saves all this trouble. The pruning shears are a vast improvement over the jack-knife. When the bees swarmed we had to hack away with this ever-present and usually convenient tool, but which, on occasions of this kind, was anything but convenient or suitable.

I have been wondering if it would not be a good thing for those who do not clip the wings of their queens to have a special belt gotten up in which could be fastened a small short saw, a pair of strong pruning shears, a smoker, a rope and perhaps some other tool that might be necessary to complete the equipment.

The majority of beekeepers believe, and believe rightly, that the only way to handle swarms is to do so by the clipped-wing plan. But something will happen, on account of which they will not get at the job, or perchance some queens will be skipped. In either case a swarm or two is liable to get to the top of a tree, and nothing but climbing after it will bring it to earth again. I have seen the day many and many a time when an outfit of tools, with a pair of climbers already hitched to a belt, and ready to strap on, would be worth a good deal. There is nothing like being prepared for an emergency; and when one is in a hurry, the more convenient and handy his tools are, the more effective will be the work.—Bee Gleanings.

HONEY IN HISTORY.

Literature is filled with honey-makers and their incomparable gift. On the height of Olympus it was called ambrosia, and was welcomed as food fit for the immortal gods. Again, they called it nectar, and offered it to the nymphs who sported amid the green fields of Thessaly. No other living creature has been more celebrated than the little brown bee.

The Vedic poets sang of honey and the honeymakers, and all the generations of India have placed them in their mythologies, their religions and their loves. The great god of gods, Vishnu himself, is often represented as a bee lying in the heart of a lotus flower.

The sun and moon are symbolized by the bee; as the dispenser of honey it was the moon, as the receiver of honey, by the sun. When the lotus flower, the symbol of nature, opens then Vishnu, the sun god, goes forth as a bee, and thus the bee becomes the symbol of birth upon earth, thus honey was used at bridals and birth rejoicings.

The murmur of the bee is a constant accompaniment to Hindoo song and love-making, and the music of the bee at times vies with the song of bird, or even celestial music. From the most ancient times the honeymaker has played a constant and pleasing part in the poetry of the Orient.

Today the wild bee is found everywhere in India; today the wild honey is prized just as it was centuries ago. The philosophers of Greece esteemed the bee, and without honey and the honeymaker the poets of Hellas would have lacked expressions of sweetness that have delighted all succeeding ages.

But it is remarkable that Greek literature treats more of the honey than of the bee. The honey of Hymettus has been celebrated for centuries. It is the classic honey of antiquity, and shares the honor with that of Hybla and Mount Ida.

"On many breakfast tables there is a pot of honey," says Gissing. "Not the manufactured stuff sold in shops under that name, but honey of the hive, brought to me by a neighboring cottager whose bees hum in my garden. It gives, I confess, more pleasure to my eye than to my palate, but I like it because it is honey.

"But think how one's view of common things is affected by literary associations? What were honey to me if I knew nothing of Hymettus and Hybla? If my mind had no stores of poetry, no memories of romance? Thus all the common things of life are lifted up by the touch of genius and made precious by poet's rhyme.'

The sweetness of honey came to be symbolical of sweetness of speech. So Hesiod tells how, when the muses would honor a son of man,

Upon his tongue they shed a balmy dew,
And words, as honey sweet, drop from his lips.

Cicero relates this story: "When Plato was an infant, a swarm of bees settled on his lips during slumber, and thus announced the sweetness of that persuasive eloquence for which he was one day famous." Xenophon, who was a writer as well as a soldier was called "The Attic Bee."

Pindar was visited by bees as he lay sleeping, and the divine Homer received his first nourishment from a priestess whose breasts distilled pure honey. In fact, nearly all the sweet singers or eloquent speakers of ancient days were in some way aided by the magic bees.—Exchange.

SUPPOSED INJURY OF CROPS BY BEES.

Bee keepers are often compelled to combat the idea that bees cause damage to fruit or other crops by sucking the nectar from the flower. This is not only untrue, but in many cases the bees are a great benefit in pollinating the flowers, making a good crop possible. A more frequent complaint is that bees puncture fruit and suck the juices. Bees never puncture sound fruit, but if the skin is broken by some other means bees will often suck the fruit dry. In doing it, however, they are sucking fruit which is already damaged. These and similar charges against the honeybee are prompted by a lack of information concerning their activities. Bees may, of course, become a nuisance to others through their stinging propensities, but bee keepers should not be criticised for things which their bees do not do.

It is profitable to use comb foundation freely, both in sections and brood-frames.

DEMONSTRATION FARMS.

James J. Hill is an example of a man in whose making the item of foolishness was wholly omitted.

"Jim" Hill, as they call him in the Northwest, wouldn't know a joke if he met it on a foot-bridge at noonday.

Moreover, Jim Hill is the greatest developer of railroad tonnage that the world has yet produced.

In a magazine article, last winter, Jim Hill said that if he had his way about it the country would build one less battleship and use the money to establish a thousand demonstration farms.

What made Jim Hill say that? Business, simply business. Battleships do not produce freight for the Hill roads. Farms do. Simple, isn't it?

But no matter what Jim Hill's motive may have been, the outstanding fact is that Jim Hill is in favor of demonstration farms. When a man, whose mind deals with business propositions as accurately and as relentlessly as an adding machine deals with a column of figures, goes out of his way to say that he believes in demonstration farms by the thousand, it is time for the plain people who never thought of such a thing and don't know what Jim Hill is talking about, to sit up and observe.

And the chances are that ninety-nine men out of ninety-nine will jump to the conclusion that he was talking about experiment farms.

Now there is just one hundred per cent of error in that conclusion.

A demonstration farm is an experiment farm—with the experiment left out.

Quite a difference, but a vital one.

Battleships come higher and higher all the time, and, it will not be long until a first-class article will cost ten million dollars.

Let us see, a million is a thousand thousands. Ten million would be ten thousand thousands. Split up into a thousand demonstration farms, that would mean ten thousand dollars for each. Right, isn't it? And, by the way, that is exactly what the territorial legislature of New Mexico appropriated two years ago for a demonstration farm—the first of its kind in the world.

If Jim Hill had his way, the New Mexico demonstration farm would be one of a thousand, instead of the only one.

* * *

In a petition addressed to the legislature of New Mexico by the Obar Farmers' Institute, urging the matter of demonstration farms, the following reasons are submitted:

First: "Seeing is believing." If a farmer can go to a farm in his own locality and see good crops grown under the same conditions of soil and climate as his own, it will have more effect than tons of talk.

Second: Such farms would become valuable sources of supply.

Third: At slight cost the methods used, etc., could be published in bulletins or the local press.

Fourth: As the experimental feature would be eliminated and no crop grown except with a view to profit, a demonstration farm woudl be largely self-supporting.

Fifth: The demonstration farm would in no way interfere with the agricultural college or the experiment station, but would supplement both in a distinct field of its own. In fact, it is the natural and logical supplement of the experiment station, since it affords the vehicle for the dissemination of ascertained knowledge.

The function of the experiment station is to "prove all things," while that of the demonstration farm is to "hold fast to that which is good."

It will be seen that Jim Hill's business instinct enables him to put his finger on the sore spot of agriculture as located by those Obar farmers.

It goes without saying, that what makes tonnage for a railroad also makes money for the farmer, and that up to the present the interest of the farmer and the railroad are identical, and it is fortunate for the farmers that in this new departure in the teaching of agriculture, they have so powerful an ally as the foremost practical railroader in the world.

New Mexico, having no sea coast, is ready to strike hands with Jim Hill on the battleship proposition, and would be glad to see him have his way about demonstration farms.

Unlike most educational propositions, the demonstration-farm proposition is founded on the essential principle of pecuniary profit. In order to be a good demonstration, it must make money. If it is found that it can be made to pay its way while filling its mission, when there is no limit to the number of those farms that can be maintained and viewed in this light, the new departure inaugurated by the territory of New Mexico may point the way to realizing the dream of James J. Hill of a thousand demonstration farms—even though we build no less battleships.—Farm and Fireside.

SUN RUINS GRINDSTONES.

Sun is a fine thing for hogs and chickens, but it isn't good for grindstones. Its rays harden the part of the stone on which they shine, and thus makes the stone wear unevenly. If the grindstone is not under a shed, or if the sun strikes it, make a box cap for it—twenty minutes' work.

Few things are more satisfactory than a good-cutting, even-faced grindstone. Used freely, it is a great labor-saver, for dull tools make work hard. If the stone gets grooved, hold the hoes or the spade upon it. This will soon bring the face level again —and it won't hurt the hoes or the spade a bit to give them keen edges. —Guy E. Mitchell.

FARMERS' AUTOMOBILES.

Much has been said in the papers about the farmers wasting their money in riotous automobile buying and of how they have threatened the financial stability of the country by mortgaging their farms to purchase the frivolous joy wagon. This condition may apply in some sections but not in Kansas. In the first place the automobile is not a pleasure vehicle on the farm but a very valuable farm implement. Of all classes of business men the farmers have more use for the automobile than any other except it be the physicians. In the second place the farmers of Kansas are not mortgaging their farms to buy automobiles. They do not need to. But even if they did, what would it amount to in the way of injury to their personal credit or a threat to the finances of the country. The kind of cars most frequently bought by farmers cost about $1500 on the average. The average value of the quarter section farm is, at a low estimate, $10,000. Now suppose a farmer should place a $1500 mortgage on his $10,000 farm, would the financial universe drop any stars? One load of hogs would pay it off.

Of the 12,000 automobiles now owned in Kansas perhaps 7000 are owned by farmers and these have increased the prosperity and comfort of the farmers or supplied the means for it. The automobile on the Kansas farm is not a luxury in any sense but a most valuable farm tool.—Farmer's Tribune.

WHITEWASHES.

Whitewash recipes seem always in demand, and when seen they should be cut out and put away. Here are two which have been frequently printed, but this time we find them in an exchange in a little more detail.

Take half a bushel of unslaked lime, slake it with boiling water, cover during the process to keep in steam, strain the liquid through a fine sieve or strainer, and add to it a peck of salt previously dissolved in warm water, three pounds of ground rice boiled to a thin paste and stirred in while hot, half a pound of powdered glue previously dissolved by soaking in cold water and then hanging over a slow fire in a small pot hung within a larger one filled with water. Add five gallons hot water to the mixture, stir well, and let it stand a few days, covered from dirt. It should be applied hot, for which purpose it can be kept in a kettle or a portable furnace. Coloring matter may be added as desired. For cream color, add yellow ochre; pearl or lead, add lamp or ivory black; fawn, add proportionately four pounds of umber to one pound Indian red and pound common lamp black; common stone color, add proportionately four pounds raw umber to two pounds lamp black.

For interior work: Slake a peck of lime till it is thick and creamy. While it is hot, mix with a pint of linseed oil and one-quarter pound of glue previously dissolved in water. Let the mixture stand several hours before applying it. A little lamp black dissolved in vinegar and mixed with whitewash gives a grayish tint, which may be preferable to pure white; a little umber gives a fawn color, and yellow a cream tint. Very little coloring matter should be used, or the shade will be too dark. If this is made somewhat thinner than indicated above and strained through a flannel cloth, it may rapidly be applied with a sprayer such as is used in spraying trees. When strained through cotton cloth the lint from the cotton often interferes with the work.

SPRAYING TO KILL WEEDS.

The Ohio Experiment Station is devoting considerable attention to the subject of weed spraying with a view to eradication. The use of chemicals as sprays to destroy weeds has heretofore been better developed in the West, with its more limited labor supply and its restricted cropping systems. There is little doubt but that weed-destroying sprays will find useful application elsewhere.

What must be the line of operation or attack in the use of weed-spraying chemicals? asks A. D. Selby, botanist of the Ohio station, in a recent bulletin. These chemicals, he says, must destroy the weeds without injury to the crop grown.

Most of our weeds are broad-leaved, or, as we all know, plants with two seed-leaves. Our cereals and grasses are narrow-leaved plants which produce a single seed-leaf. Upon the different reactions of these two classes of plants to the chemical sprays we must depend for our result—for injury to the weeds without harm to the crop. We find that nearly all crops and weeds of the broad-leaved class of plants will be injured by these chemical sprays, and all weeds of the narrow-leaved class will escape injury by the sprays. It follows that crops of the clovers, alfalfa, soy beans, vetches and rape will be killed by such chemicals as destroy broad-leaved weeds, and that the sedges, quack grass, crab grass and wild onion or garlic will not be killed by spraying with such solutions as are not injurious to the grasses, cereal grains, etc. We may hope to destroy such weeds as mustards, dandelions, ox-eye daisy, white-top and horse-nettle, as well as practically all other broad-leaved weeds, by use of these sprays. At the same time, these sprays will leave blue grass, timothy, red-top and other grasses, including the growing cereal grains, such as wheat, oats, rye, etc., without injury if properly adapted in strength and time of application.

Briefly summarized, however, continued Mr. Selby, weed sprays, when properly adapted, should be available for the destruction of the larger portion of our pasture and grain field infesting weeds, when the methods are rightly and economically developed. It would certainly be a travesty on our methods of culture to expect to substitute weed sprays for culture in the growing crop, such as in corn fields and the like.—Wisconsin Agriculturist.

When your train uv thought comes to a stan'still, git out an' take a walk; probberly thet is what the train needs.

TO REPAIR THE CARRIAGE TOP.

Enameled leather will last a long time provided it is kept clean. It should be washed occasionally with castile or an oil soap and warm water. After the enamel has broken and scaled off the following is recommended:: Clean the leather thoroughly with castile soap and warm water. Dry with a soft, woolen cloth, and then apply a dressing made by melting 2 ounces of beef suet in a short pint of neatsfoot oil, to which is added a coloring of drop black and a piece of beeswax as large as a thimble. Melt the beeswax and add the oil and suet to it, stirring thoroughly. Apply with a cotton cloth that is saturated with it and finish smoothly. Keep some on hand for an application to the carriage top about once in every four or five months.—Agricultural Epitomist.

Idaho is making preparations for the sale of 24,000 acres of timber land in Nez Perce and Idaho counties.

Every Farmer and Thresherman Should Investigate These Two Farm Power Machines

The Avery Farm Tractor For Light Work
The Avery Double Undermounted Traction Engine For Heavy Work

Road Work Field Work Belt Work

These pictures show some of the kinds of work the Avery Gasoline Tractor will do.

A Wonderful New Gasoline Farm Wagon And General Farm Power Machine

Since the day when mechanical power was first used on a farm there has been no greater invention that means more to farmers than the Avery Farm Tractor shown above.

The Avery Company has long been working on the problem of designing a machine that would take the place of horses and is now able to offer the *first successful machine* to do the *work* of *horses* on the *average sized farm.*

Many have already been sold and are in successful use. Severe tests have proven that they are able to stand up under hard service and that they are reliable.

The Work the Avery Tractor Will Do

Road Work

It will do the work of two to four teams in hauling. Will carry 3 ton load on its own body and pull other loaded wagons behind. Has slower speeds for heavy hauling and faster speed for quick trips with lighter loads—from 3 to 15 miles per hour.

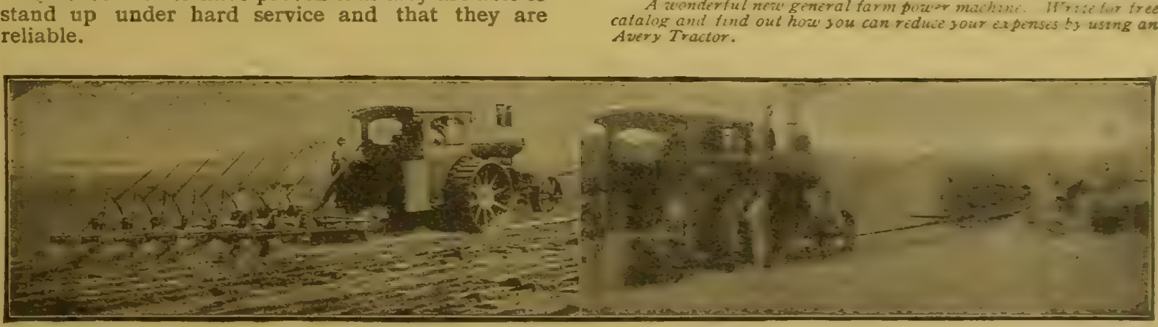
Field Work

Will pull 3 fourteen inch plows, harrows, packers, clod crushers, binders, and other machines in the field.

Belt Work

This same machine will operate a feed grinder, pump, baler, saw, small thresher and other belt-power machines.

A wonderful new general farm power machine. Write for free catalog and find out how you can reduce your expenses by using an Avery Tractor.



Plowing Threshing

Plowing and Threshing with an Avery Double Undermounted Traction Engine.

If you need *more power* for plowing, threshing, road grading, etc., here is the engine that *Pulls Harder, Lasts Longer* and is *Easier to Handle* than any other. The Avery Double Undermounted Traction Engine. (Patented.)

The *only* Traction Engine that is *Undermounted.* The right construction of an engine for all around traction and belt work. The most successful plowing and threshing engine built today.

Find out all about either one or both of these machines. Write for free catalogs with illustrations of machines in operation. Don't think of buying until you investigate them. Address

AVERY COMPANY, 921 Iowa Street, Peoria, Ill.

Also Makers of Grain Separators and Corn Growing Machinery—Send for Catalogs.

Southern California, Nevada and Arizona Agents for Avery Farm Tractor Described Above.

MISCELLANEOUS

For Sale—350 stands bees located near Los Angeles. L. E. Williams, Hemet, Cal.

Business Notes

RUEHL-WHEELER.

The Ruehl-Wheeler Nurseries of San Jose have found their business growing from year to year until more acreage and more office room are required. Their new price list just issued announces that after May 1st their new and permanent location at 163 South Market Street will be occupied by the enlarged concern. Until that time, however, the old location, 121 W. San Fernando Street, San Jose, will be the address to which to write to secure the 1010-1911 nursery price list. Citrus and deciduous trees, nuts, vines and a full line of ornamentals are all listed with price.

One of the most perplexing problems which has ever confronted fruit growers of California is the handling of the mealy bug. Fumigation is not effective unless used so frequently as to be prohibitive in price. Spraying is more satisfactory but must also be applied several times. We now note that the Western Wholesale Drug Co. is introducing the F. & G. Fungicide and Germicide, which is recommended for destroying not only the red spider and red scale and fungous growths, but also in treating mealy bug. This has been tested and found to work admirably by Mr. Wm. S. Eisenberg. The seriousness of the mealy bug situation should impel those who have occasion to deal with it to make a test of the F. & G. Spray.

Fertile eggs for hatching. Choice varieties. White Rocks, White Wyandottes and White Orpingtons at $1.50 to $4.00 per setting; $6.50 to $10.00 a hundred. Ducks—White Muscovy, Dark Muscovy, White Indian Runner, White Pekin, Buff and White Orpington, $1.00 to $3.00 a setting; $5.00 to $12.00 per hundred. Send for Circular. Pheasants' eggs in season.

WICK'S WHITE FOWL FARM, Moorpark, Cal

Household Department

GRAN'PA'S CHRISTMAS EVE.

I.

On Christmas eve, my gran'pa he
He'p me set up my Chris'mas tree;
An' nen he laugh an' shake his head
An' say it's time 'at I'm in bed;
But I say I'll not say good night!—
I'm go' to sit up; pa said I might
As long as I wan to, buhcause
I'm go' to wait for Santa Claus.

II.

Nen gran'pa he ist laugh again
An' say he en-vy me: an' nen
He get a great big rockin' chair
An' sit down in it over there;
An' take me on his lap an' say
It seems ist like 'twas yesterday
When he would wait by candlelight
For Santa Claus to come at night.

III.

So all the folks they go to bed,
But me an' gran'pa wait, instead,
An' he gets talkin' 'bout the time
When hes' a boy, ist same's if I'm
A grea' big man like him, or he
Ist a little boy like me;
An' how he'd watch for Santa Claus
To come down where the fireplace
was.

IV.

Nen I tell how some folks say
There ain't no Santa anyway!
An' he stomps 'at lame leg o' his
An' says: "You can tell them folks
there is!"
An' nen he tell me how he brought
The bestest gift he ever got—
'At Santa on one Chris'mas day
Give him my gran'me, anyway.

V.

An' nen I laugh, but he don't speak—
A grea' big tear was on his cheek!
Buhcause my gran'ma's gone away
To some place where the angels stay;
An' so I hug my gran'pa tight!
An' next we know we've slept all
night!
An' I got lots o' things because
My gran'pa knows Santa Claus.

—Wilbur D. Nesbit.

SHEP'S CHRISTMAS.

Just a few miles from a city, and situated among the hills and rich lowlands along the bank of the Tennessee river, is a quiet little farm about which my story is concerned.

Shep was a dog, and a fine, handsome, big-hearted fellow he was. His master, who owned this farm, was very fond of him, and always provided for him just the same as if he were a member of the family. Great care was given to his food and comfort.

Many were the happy days Shep spent following his master on the farm and driving home the cows for the maid, and lounging about the fireplace to be petted and talked to. But somehow, things do not always stay good, and times changed for Shep.

One day the good man's wife died, and not long after her husband died, too. The farm was sold to strangers, and the people who bought it had more dogs than they needed, so what did they do but scold at Shep and kick him and refuse him food.

One day he ran as fast as a hungry dog can run to get away from rocks and hot water, and never went back again. It was the day before Christmas, and how different it was from the way Shep had always spent Christmas before. His master had always let him go on hunts with other dogs and have great fun in running and barking over the hills and woods after squirrels and rabbits and quail, but those good times were gone now for him and he was lonely and friendless and hungry, and his long shaggy hair that his master had kept so clean was dirty and changed, for he did not know how to give himself good baths in the pond as his master had done—baths that used to make the big, white spot on his breast shine so bright against his black hair.

On this Christmas eve he reached the limit of all he could bear, so he ran on and on until he reached the city, and, not being used to such a big place, he was puzzled to know what to do and where to go. But he was so tired and weak he did not have life enough to care, so he just wandered wherever his feet took him.

At last he was so overcome he lay down in a strange place and fell asleep. He did not notice where he was. He did not care. He was glad to get away from rocks. After a while he awoke and looked around, and found he was in front of a large, fine dwelling, and there was a crowd of merry children playing in the yard and talking about Christmas. Shep wondered if Christmas would bring him a bone or anything to eat, for he was hungry. He loved children in better days, and he looked lovingly at the merry group in the big fine yard and thought to himself how many nice bones and good things to eat there must be in the kitchen of such a fine place.

But as much as he longed to go and romp with them, he remembered the many times he had been driven away, so he did not go, but he was so hungry he could not resist the temptation to steal around to where the barrels sat in the back of the yard. While he was climbing up on one, he heard the gentle-looking mother of the children say, "O, husband, look what a fine dog. Do let us call him and give him to Baby Frederick for a Christmas gift tomorrow. See how hungry he looks." And then she called to Shep, "Come, sir; come here!" in such a sweet voice poor Shep lost no time in going to her, but was soon to be disappointed again. The husband objected and said he did not see he was a fine dog; that he looked like a dirty thief, stealing out of barrels, and turning to Shep he said, "Be gone, sir!" Business had gone wrong with him, and he was in a cross mood. He then asked his wife for his dinner, and said he was in a great hurry. She soon had it prepared, and just as he was finishing his meal he heard wild screams in the yard among the children, "Mamma! Papa! Run! Run! Oh! Oh! A cow is killing Frederick! Oh! Oh!"

The father forgot his mood and rushed into the yard, expecting to find his baby dead, for there was a vicious cow in the neighborhood that hated children. With one bound he was on the spot, and there before his eyes was dear old Shep holding the mad cow by the throat and the cow kicking and moaning but unable to get loose. Shep had saved the child. The next moment found the father with his boy in one arm and the other around the dog's neck, and all the children with their mother trying to see which could hug Shep the tightest. They forgot his dirty coat and his starved look. They just thought of one thing—the dog had saved their baby boy.

Shep had a kennel that night and more to eat than he wanted. He was devoured with hugs and kisses. He

"There's very little heat. But try this with an ordinary lamp and see what happens."

LIGHT—NOT HEAT

The Angle Lamp gives less heat than any other method except incandescent electricity. Will *not* scorch or discolor your ceiling, etc. Eliminates possibility of fire. Gives well distributed shadowless light without dangerous and unpleasant heat—delightful to read or work by.

The Angle Lamp

is the simple, economical, convenient and perfectly satisfactory method of burning common kerosene. It *never* smokes or smells whether burned at full height or turned low. *Lighted and extinguished like gas.* Filled like a water bottle. Requires filling about once a week.

The Cheapest Form of Light

Being fully ⅓ to ½ more economical than even the ordinary lamp it soon saves its cost. It is made in 32 varieties. Come in and see it or *write for catalog.*

also had a good bath, and then they saw what a beauty he was.

Christmas morning a collar was put around his neck, and baby Frederick became his proud master. Shep's sad life was at an end. He had a home.—Ex.

IS THERE A SANTA CLAUS?

Many years ago a little girl named Virginia O'Hanlon wrote to the editor of the New York Sun, the late F. P. Church, and said:

"Dear Editor: I am eight years old. Some of my little friends say there is no Santa Claus. Papa says 'If you see it in The Sun it's so.' Please tell me the truth; is there a Santa Claus? —Virginia O'Hanlon."

To this trusting child the great editor wrote an editorial reply that seems worthy of wider reading. He said:

"Virginia, your little friends are wrong. They have been affected by the scepticism of a sceptical age. They do not believe except they see. They think that nothing can be which is not comprehensible by their little minds. All minds, Virginia, whether they be men's or children's, are little. In this great universe of ours man is a mere insect, an ant, in his intellect, as compared with the boundless world about him, as measured by the intelligence capable of grasping the whole of truth and knowledge.

"Yes, Virginia, there is a Santa Claus. He exists as certainly as love and generosity and devotion exist, and you know that they abound and give to your life its highest beauty and joy. Alas! how dreary would be the world if there were no Santa Claus! It would be as dreary as if there were no Virginias. There would be no childlike faith then, no poetry, no romance to make tolerable this existence. We should have no enjoyment, except in sense and sight. The eternal light with which childhood fills the world would be extinguished.

"Not believe in Santa Claus! You might as well not believe in fairies! You might get your papa to hire men to watch in all the chimneys on Christmas Eve to catch Santa Claus, but even if they did not see Santa Claus coming down, what would that prove? Nobody sees Santa Claus, but that is no real sign that there is no Santa Claus. The most real things in the world are those that neither children nor men can see. Did you ever see fairies dancing on the lawn? Of course not, but that's no proof that they are not there. Nobody can conceive or imagine all the wonders there are unseen and unseeable in the world.

"You may tear apart the baby's rattle and see what makes the noise inside, but there is a veil covering the unseen world which not the strongest man, nor even the united strength of all the strongest men that ever lived, could tear apart. Only faith, fancy, poetry, love, romance, can push aside that curtain and view and picture the supernal beauty and glory beyond. Is it all real? Ah, Virginia, in all this world there is nothing else real and abiding.

"No Santa Claus! Thank God! he lives, and he lives forever. A thousand years from now, Virginia, nay, ten times ten thousand years from now, he will continue to make glad the heart of childhood."

DON'T SHIRK.

Point out the man who today is at the front, and we shall name him confidently as one who never shirked, who always gave an honest day's work, and who never failed to take a lively interest in his employer's affairs.—Ex.

THE CHRISTMAS PUDDING.

The essentials of a plum pudding found in a great number of receipts, both printed and in domestic use, do not vary greatly. Almost all, whether rich or plain, call for fine bread crumbs, suet, sugar, raisins, currants, eggs, milk (sometimes omitted), salt, and spice. In addition to these ingredients, others not unusual are citron, candied orange and lemon peel, also juice and grated rind of these fruits, almonds and other nuts, wine, rum or brandy, cream, figs and dates, molasses and occasionally flour and soda.

Wetting should be only sufficient to bind smoothly, and where a large number of eggs and also wine or brandy are used, milk is often not required. The old-fashioned English plum pudding, to be safely kept indefinitely and that could be sent around the world if necessary, was not at all unlike a rich fruit cake. The long boiling or steaming, instead of baking, of course avoids any hard crust and retains softness. A plain plum pudding can be baked in a moderate oven if more convenient.

Individual pudding molds can be had to suit the prevailing fancy for serving separately, but for the Christmas dinner the full-sized family pudding makes a much more effective entrance. The receipts that follow are of graduated plumminess and also show different methods of handling:

English Plum Pudding—Three cupfuls of fine bread crumbs, two cupfuls of chopped suet, two cupfuls of sugar, two cupfuls of raisins, half of them chopped, one and a half cupfuls of currants, half a cupful of citron, half a cupful of candied orange and lemon peel, grated rind and juice of one orange and one lemon, one cupful of blanched almonds cut in strips, half a dozen figs chopped, one teaspoonful of cinnamon, half a teaspoonful of cloves, half a nutmeg, grated, half a teaspoonful of salt, two wineglassfuls of Madeira, or one of wine and one of brandy. Mix these ingredients thoroughly, and let them stand for forty-eight hours in a covered jar. Brown sugar is preferable in all dark mixtures, or a little caramel added to white sugar deepens the color and helps in flavor. For the final mixing, stir two tablespoonfuls of flour to a smooth batter with a small cupful of rich milk and add, with eight well-beaten eggs. Or more eggs may be used and the milk omitted. There must be sufficient wetting to bind the whole smoothly. Boil or steam for at least five hours. A general rule is that such a pudding can hardly be cooked too long! Steam again for an hour or more before serving. A hot sauce goes to the table with it.

Plain Plum Pudding—One and a half cupfuls each of bread crumbs, finely chopped suet, and mixed raisins and currants; one cupful of sugar, half a cupful of citron or candied peels, chopped, salt, half a nutmeg, grated, three eggs, and a scant cupful of milk. Stale cake instead of bread crumbs, with less sugar, makes a good plain plum cake. This may be baked for two hours in a moderate oven in place of steaming.

Eve's Pudding—(In which the apple is involved.) Two cupfuls of bread crumbs, two cupfuls of tart apples, chopped, one cupful of raisins, also chopped, half a cupful of currants, one cupful of suet, two well-beaten eggs, a pinch of salt and a large teaspoonful of cinnamon. Moisten with a little sweet cider. A caramel sauce is especially good with it.

Graham Plum Pudding—Two cupfuls of graham flour, one cupful of milk, one cupful of molasses, one cupful of raisins, half a cupful of currants, half a teaspoonful of soda, a saltspoonful of salt. Mix all smoothly together, cover, and bake in a slow oven three hours; or boil three hours, then bake in a hot oven, uncovered, for fifteen minutes. Serve with a good sauce.

Foamy Sauce Will Do. Cream half a cupful of butter with a cupful of sugar; add a little grated nutmeg and set over boiling water. Flavor with wine or caramel, and add a small cupful of rich milk, hot, stirring until it foams.—Country Gentleman.

FOR A CHRISTMAS DINNER TABLE

In the center of the table set up a small tree, three feet or a little higher; dress it with silver tinsel, silver and red balls and red and white candles. Old-fashioned red and white candy toys can also be hung by red ribbons and later distributed with joking speeches to the guests for whom they have been chosen—such as pipes, pistols, spades for the men, scissors for the clever sewer, irons, tubs, brooms for the busy housekeepers, a harp for the musician, etc. All these forms can be bought at any candymakers' establishment.

At holiday-time the candy-makers often use for window decorations, long sticks of clear candy of various colors, and an accommodating manager will willingly color a number to order, although they are not as a rule made for sale. Those I used were eighteen inches long, one quarter of an inch thick, of clear twisted candy colored a bright red and costing twenty cents a pound.

The table was laid for twelve, and at each plate was placed a tripod made of these sticks, tied together near one end with narrow ribbon and in each tripod hung a little stocking, five inches long some made of red, some of white tarlatan filled with salted nuts and tiny chocolates.

This may sound like a meager decoration, but try it and see how the red sticks stand out against the white cloth and enhance the glitter of the silver-trimmed tree.—Woman's Home Companion.

ANTIQUITY OF CHRISTMAS CELEBRATIONS.

The festival of Christmas Day is one of great antiquity and was observed at a very early date. St. Chrysostom, Bishop of Constantinople, who lived in the fourth century, in one of his sermons still extant, and which is now 1507 years old, refers to the festival as even then of "great antiquity."

In the year A. D. 337 a strict inquiry was made into the probable date of Christ's birth and the twenty-fifth day of December was fixed as the one which harmonizes completely with the scriptural facts.

There are sermons extant preached on that day by Gregory and St. Basil, and "Christmas" is spoken of even by Clemens Alexandrinus, who died in the first century a short period after the death of St. John.

We also read that in the year A. D. 284, at Nicomedia, while the ruler was holding court in that city, he heard that the Christians were celebrating the "Nativity," whereupon he ordered the doors of the churches to be made fast and the worshipers to be consumed.

So you see that Christmas Day comes to us, if not hoary with frost and snow, as it is in some places, yet for us hoary with antiquity.

It is the center of all human history. The "B. C." and the "A. D." meet in it. It is the point of time that the ages past looked forward to with anxious hope—and that the ages to come will look back to with loving admiration.—San Bernardino Sun.

CHRISTMAS DON'TS.

Don't leave the cost mark on presents.

Don't let money dominate your Christmas giving.

Don't let Christmas giving deteriorate into a trade.

Don't embarrass yourself by giving more than you can afford.

Don't make presents which your friends will not know what to do with, and which merely encumber the home.

Don't give because others expect you to. Give because you love to. If you cannot send your heart with the gift, keep the gift.

Don't give too bulky articles to people who live in small quarters unless you know that they need the particular thing you send to them.

Don't wait until the last minute to buy your presents, and then, for lack of time to make proper selections, give what your better judgment condemns.

Don't decide to abstain from giving just because you cannot afford expensive presents. The thoughtfulness of your gift, the interest you take in those to whom you give, are the principal things. The intrinsic value of your gifts counts very little.

Don't give things because they are cheap and make a big show for the money. As a rule it is a dangerous thing to pick up a lot of all sorts of things at bargain sales for Christmas presents.

Don't leave your manners at home when you go shopping for Christmas gifts, shove your neighbor away from the bargain counter and snap at the tired clerk.

HOW TO KEEP CHRISTMAS.

There is a better thing than the observance of Christmas day—and that is keeping Christmas.

Are you willing to forget what you have done for other people and to remember what other people have done for you?

Are you willing to stoop down and consider the needs and desires of little children; to remember the weakness and loneliness of people who are growing old; to stop asking how much your friends love you, and ask yourself whether you love them enough; to try to understand what those who live in the same house with you really want, without waiting for them to tell you; to trim your lamp so that it will give more light and less smoke, and to carry it in front so that your shadow will fall behind you; to make a grave for your ugly thoughts and a garden for your kindly feelings, with the gate open—are you willing to do these things even for a day? Then you can keep Christmas.

Are you willing to believe that love is the strongest thing in the world—stronger than hate, stronger than evil, stronger than death—and that the blessed life which began in Bethlehem 1900 years ago is the image and brightness of the eternal love? Then you can keep Christmas.

And if you can keep it for a day why not always

But you can never keep it alone.—Henry van Dyke.

San Francisco Markets

SAN FRANCISCO, Dec. 20, 1910.

Butter.

The butter market is not strong, though a 2c advance is noted during the week. In fact, a still higher price by 2c was noted during the last of the week, and a decline was made on Saturday.

Price to trade 2½c in advance of the following Produce Exchange quotations:

California extras, lb	.34½
California firsts	.30
California seconds	.27
Storage	.30½

Cheese.

California flats, new	.16
Cal. Y. America, fy., new	.16½@17½
Oregon, fancy	.16

Eggs and Poultry.

Eggs declined during the last few days of the week, and are now a couple of cents under last week's prices, with a rather weak condition of the market at this writing.

Official quotations of the San Francisco Wholesale Dairy and Produce Exchange are:

Fresh ranch extras	.38½
Firsts	.37½
Seconds	.33
Storage	.32

Hens, doz	4.00@10.00

Beeswax, lb	.24@30

Scott, Magner & Miller say:

Arrivals of hay for the week have been 2,900 tons, which is an increase of nearly 100 per cent over what we have been receiving recently.

The market values during the week have not been changed in any respect. Prices have been just about the same as heretofore. The dullness that has been noted for some weeks has continued throughout this week. Trade conditions have not improved in any particular. While arrivals have been larger, it has not been because the demand has in any way required it.

The fact that hay cannot be purchased in the hay centers from the present holders at prices that will permit of marketing in the San Francisco and Oakland markets at any profit is somewhat responsible for the present dull condition of the trade and the lack of activity and of any large operations.

Shipments on export account have been rather moderate for the last two weeks, while shipments along the coast have also been lighter during the same time.

There has practically been no alfalfa hay shipped into this market recently, and although the market is not active, yet the feeling is firm, for the reason that it is anticipated that our stocks on hand of alfalfa are lighter than they usually are at this time of the year. There is also quite a little interior demand for alfalfa hay.

Fancy wheat	12.50@13.50

Citrus Market

LOS ANGELES, Dec. 21, 1910.

The holiday trade being practically over, there is a slackening of demand and a consequent easing off of the market. On the whole the holiday demand has been very active, and offerings have been well received. Fruit is now all well colored, with but few cars going daily.

California lemons are still favorites in the New York markets, this season being the first when that market has received them more readily and at a higher price than the imported. Californias are showing up in remarkably good form, and the foreigns, if anything, are below their average.

Shipments.

Shipments of oranges to date, since November 1, from Southern California, 2,128 cars; of lemons, 613 cars; or a total of 2,741. To same date last season, 717 cars of oranges and 455 cars of lemons. Tulare county's shipments to date this year are 1,938 cars; last [illegible]ear, this date, 2,125 cars. Butte [illegible]ty's shipments to date are 404 [illegible] as against 300 this date last year.

[illegible]EW YORK, Monday, Dec. 19.—[illegible]ty-three cars of navels, one car [illegible]Jaffas, four of lemons and one of [illegible]a navels were sold. The market [illegible]asier on small sizes of navels, [illegible]trong on large sizes. Arizonas [illegible] easier. The market was unchanged on lemons. The weather was fair and warm.

COUNTY LIBRARIES.

The first annual conference of California county librarians is to be held at the California State Library in Sacramento, December 28 and 29. This will be one of the most significant library meetings ever held in California, as it formally marks the inauguration of a movement whereby the entire people of any county adopting the county library system may have free and unlimited library privileges.

Although the plan of forming county library systems has been actively carried on in this state for only about a year, it has already been adopted by twelve counties, and several more are preparing to start in. Those already having adopted the system are Santa Barbara, San Joaquin, Alameda, Sacramento, Modoc, Tulare, Fresno, Kern, Merced, Madera, Yolo and Del Norte counties, all of which will be represented at the conference by the librarians in charge of the county library system. Other leading librarians, including William R. Watson of San Francisco, Purd B. Wright of Los Angeles, Charles S. Greene of Oakland, and James L. Gillis, state librarian, will attend.

The county library movement is being received with much enthusiasm all over the state, and is being watched with eager interest by the library world all over the United States, as it offers possibilities in library extension such as no other state in the Union has reached; and which, when fully adopted, will make the library as complete in its area of service as the school system is. It will be the work of the coming conference to plan and discuss the best means of making the county library most effective.

DAIRY OPPORTUNITY.

The sale of 170 dairy cows at the Santa Ana Jersey Farm next Tuesday offers opportunity for purchase of some of the best dairy stock in the state. Readers may recall photos of this dairy after the banquet in the barn at the time of its opening a year or more ago. The buildings and fittings of this dairy are almost perfect, and the cows the best. Most of them are Jerseys, though a few registered Holsteins are in the herd and will be sold. The average test of the herd is 5 per cent. The cows are milked at 3 a. m. and 3 p. m., so that prospective customers may visit the dairy prior to sale and witness the milking. Hogs, horses, chickens, wagons, implements—everything will be sold.

The farm is just in the outskirts of Santa Ana, Orange County, and Mr. J. T. Raitt, the manager, will give every opportunity to secure fullest knowledge of the stock. For fuller particulars see ad on another page of this Cultivator.

ARMSTRONG NURSERIES.

The John S. Armstrong Nurseries at Ontario have fallen into the habit of issuing every year a remarkably well printed and handsome nursery catalogue. The one issued this year is of 70 pages full of information on fruit trees and ornamental stock. The text is made plainer with lavish use of engravings, some being full-page half-tones, others smaller with several to the page. The fund of information furnished makes it well worth the asking, for it will be sent on writing to the John S. Armstrong Nurseries, Ontario, Cal.

LANGDON'S TOMATOES

"I have tried all the various strains of Earliana on the market, and yours is the only one I have found that meets my idea of what a good early Tomato should be."—Prof. W. F. Massey.

J. M. Myer, Gridley, Cal., writes Nov. 28, 1910: "I tried one-half ounce of your strain of Earliana last year, and alongside of two other crack strains of Earliana yours were ripe a full week first and 25 per cent finer in every way—the finest thing in the line of early tomatoes I ever saw, and I have been at it for thirty years."

By seven years' selection we have produced the Earliest, Hardest, and Smoothest Tomato ever grown. Our location near the Canadian line tends to breed in earliness and vigor, for we have no blight. All our seed is home-grown, is extra large and plump, starting strong, vigorous plants. Send for our circular and get more inside facts.

If you want to be first on your market with perfect Tomatoes that will bring a premium over top-notch prices, plant Langdon's Northern Adirondack Strain of Earliana Tomatoes.

Price: ½ oz. 40c; 1 oz. 60c; 2 oz. $1.25; 4 oz. $2.00; 8 oz. $3.50; 1 lb. $6.00

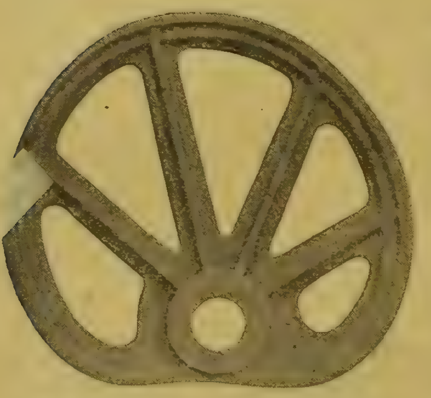
The Luitwieler Non-Pulsating Pumping System

Deep Well Pump Talk Continued :



Cut showing the Luitwieler heart-shaped cam and the only reciprocating pumping mechanism applying the power uniformly throughout the full stroke and uniform speed of the water pistons in both directions. The cam principle is universally conceded to be the most perfect mechanism for lifting water from deep wells or against pressure. Luitwieler pumps are the result of 33 years experience and embody the perfection of the cam principle.

The mechanism is balanced, and our pumps are tested for smoothness of operation, to be run being driven by only a ⅜-inch belt lace, a test impossible with any other reciprocating pump. Luitwieler pumps are in a class by themselves, with fewest working parts and giving most perfect results.

Possibilities of the Live Stock Industry in California

BLUE RIBBONERS AT THE CALIFORNIA STATE FAIR.

California was once famous for its thoroughbreds. Today its stables are as famous as once were those of Kentucky, but the wide attention attracted is not granted as it once was, that is as to the running horse. Drafters, coachers, and roadsters are more in evidence on the big ranches. The race track may have suffered, but the farmer, the truckman, and others have gained.

The greatest advancement in stock raising in the State is, however, along the line of dairying. The State has imported some remarkably fine stock during the past few years and has bred up from former importations much that is its superior. With the advancement and increase in production of dairy products, the swine industry has kept pace, and yet the State is importing annually millions of dollars worth of meats. In consideration of the matchless possibilities in production such a condition cannot continue, and the wise breeder is increasing his producing power to the limit. Speed the day when California supplies her own markets.

ARNOTT DOUBLE DISC HARROW

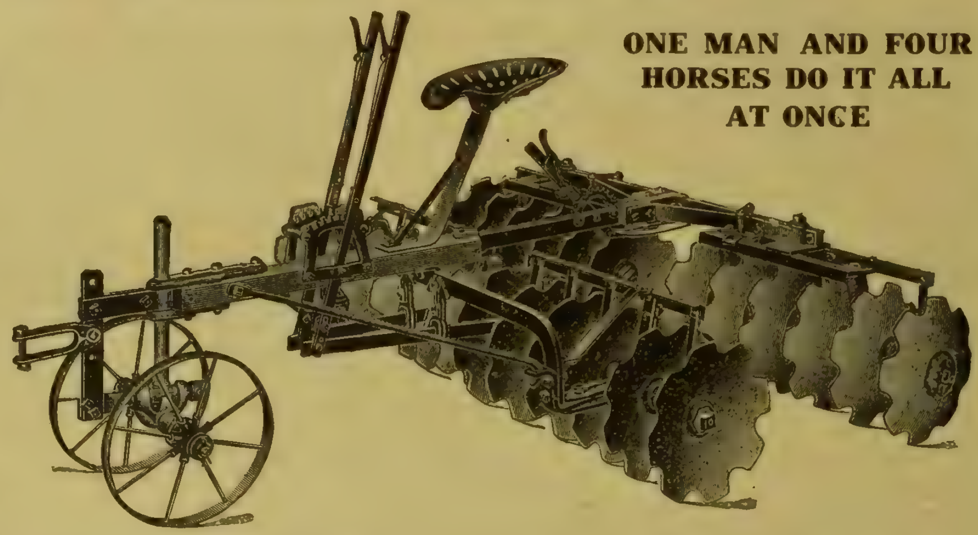
A Plow—A Disc—A Pulverizer—A Smoothing Harrow all in one

The SENSATION of the Day

Compare it Point for Point With Any Disc Harrow Made

Double Gangs
Double Cut
Double Throw
Double Levers

ONE MAN AND FOUR HORSES DO IT ALL AT ONCE



The flexibility of the **Arnott "Double-Cut"** in contrast with the stiff action of other two-way harrows is what is making it so popular. This flexibility is possible because of our Universal Joint connecting the front and rear gangs. For lack of this feature other double harrows have a good deal of side draft and will not make a square turn without digging a great hole. This can't happen on the **Arnott.** Independent front and rear levers within easy reach of rider.

Look on this Smyrna Fig Picture and Then on This:

FIRST INTRODUCTION OF THE BLASTOPHAGA

Established in California Years Ago.—The Gates and other old Caprifig Trees

WALTER T. SWINGLE AND G. P. RIXFORD

(An Address delivered before the State Fruit Growers' Convention at Stockton.)

It will come as a surprise to those familiar with the history of the Smyrna fig industry in California to learn that recent investigations have convinced the writers that the fig insect (Blastophaga) has been established and breeding by myriads right in the heart of the San Joaquin Valley for over forty years.

During all the heated discussions of two or three decades ago as to the need of caprification to induce Smyrna fig trees to set a crop, the means of proof were right at hand.

The thousands who grew the Bulletin Smyrna trees to bearing age in the 80's only to be disappointed because of their uniform sterility, could have saved their crops by a few profichi from the trees we have discovered.

The Roeding orchard at Fresno which was maintained for so many years at a dead loss and serious financial risk to the owners because of Mr. Geo. C. Roeding's enthusiastic faith in the ultimate introduction of the fig insect, would have paid from the start if only it had been known that less than a hundred miles down the San Joaquin Valley was a huge caprifig tree producing multitudes of the Blastophagas every year.

The numerous and discouraging unsuccessful attempts to introduce the insect made from 1889 to 1898, need not have been made. The expense to the Department of Agriculture and the trouble taken by one of the writers to introduce and establish the North African Blastophaga in this state in 1890 were alike unnecessary.

John Bleasdale in the early 70's told Dr. Gustav Eisen of his observations on caprification in Portugal, thereby arousing Dr. Eisen's interest in the subject, so important to the later development of the Smyrna fig industry. Before this happened, however, Blastophaga was established in this state and caprification was occurring on a small scale (without artificial help on at least one California ranch.

Early in December, 1908, while examining the Smyrna fig orchards near Modesto, Stanislaus county, California, the writers heard on every hand complaints as to the inefficiency of profichi with which to caprify the young Smyrna fig orchards. Male trees, though planted simultaneously with the fertile trees, had not begun to bear soon enough and there was a lively demand for caprifigs from older male trees.

We were shown one old caprifig tree growing in a dooryard in Modesto, the fruit of which has been used successfully to caprify young Smyrna fig trees. This tree was about 30 years old and was doubtless sent out from the Bulletin office by one of the writers. We also heard of a tree, said to be much older, that had also yielded many caprifigs, used in the orchards about Modesto and Ceres, but did not at that time have an opportunity to investigate it.

In January, 1909, one of the writers was at Modesto again and looked up this tree, growing some ten miles directly west of Modesto. It proved to be a huge tree about 45 feet high with a spread of branches of 40 feet and a trunk 8 feet in circumference just below the branches. It is growing near the house on the ranch of Samuel Gates and was there in the late Summer of 1868 when he purchased the property. The tree was then 7 or 8 feet high and the trunk the size of a man's wrist. It had been set out in 1867 by Mr. Louis Adams of Stockton. Mr. Gates, his wife and his daughter (Mrs. W. F. Green) were very positive that the figs on this tree had always been full of "bugs." The daughter said "I am 36 years old and as long ago as I can remember I tried to find figs that I could eat, but they were all full of those little winged ants." It may be mentioned that late in the fall occasionally a fig is found that is not infested and is edible. A visit a few days later by the other of the writers convinced him likewise of the truth of this remarkable story.

During the second visit it developed that a Mr. Frazier of Stockton, who dug a well near the tree in 1869, said, "It is a male tree and will never bear fruit, but all the tres around (several other ordinary fruit trees had been set out by Mr. Adams) will bear bountifully as long as you keep this tree; so never cut it down." Probably because of this advice, and partly because of the fine shade the tree gave in summer, it has been spared during all these years, although at certain seasons it was quite a nuisance because of the worthless fruit that dropped by the bushel just outside the kitchen door. Only within the last few years have the superabundant profichi been utilized to some extent in caprifying the young Smyrna fig orchards around Modesto, barley sacks full of profichi being carried away containing Blastophaga so numerous as to blacken the bags as the insect escaped from the fruit and crawled out through the coarse fabric.

The oldest son, Mr. G. C. Gates, a mining engineer, living in one of the Bay cities near San Francisco, was a boy of 12 years of age when his father purchased the ranch, He went with his father to look it over previous to the purchase, was much interested in the fruit trees, and remembers distinctly that the fig trees were higher than his head. He is positive that the old one bore figs that contained insects as early as 1869. His independent testimony is strongly confirmatory of that given by his father, mother and sister.

He recollects that the tree always bore fruit from the time it was the size of a man's wrist, when his family purchased the ranch in 1868. He cut open figs many times and always found the "worms."

It may be noted in this connection that in old caprifigs that have dropped to the ground, often only the wingless male Blastophaga, not unlike small grubs can be found.

Additional evidence is presented in the following letter from Mr. Homer K. Pitman, pastor of the First Presbyterian Church at Modesto, himself a fig grower, who conducted both the writers to the Gates ranch and heard the detailed evidence twice:

Modesto, Cal., Jan. 26, 1909.

Mr. Walter T. Swingle,
Monterey, Cal.

Dear Sir: In addition permit me to give you some more information concerning the Gates caprifig tree. Mrs. Emily Ross, a neighbor of mine, moved to the old town of Tuolumne City in May, 1869. This is about three miles from the Gates ranch. She lived there two summers, coming back to Modesto in January, 1871. While there

(Continued on Page 664.)

THE PLAIN FACTS OF FIG WASP HISTORY

Absolutely no Foundation for Claims Concerning the Early Establishment of the Blastophaga grossorum in California

GEORGE C. ROEDING, FRESNO.

The recent paper read by Mr. G. P. Rixford at the Thirty-eighth Fruit Growers' Convention held in Stockton, entitled "The First Establishment of Blastophaga in California," to which Dr. Walter T. Swingle was a joint contributor, refers to so many matters with whihc I happen to be familiar, that I do not feel disposed to allow the statements made in this paper to go unchallenged.

To begin with allow me to say that I am not making this reply because I am in any way piqued because the credit which has been accorded to me for my part in connection with the importation and successful establishment of the Blastophaga in California will be taken away, because of the recent discoveries of Messrs. Swingle and Rixford. On the contrary, if facts in any way conclusive were presented to me, I think I am broadminded enough to give proper credit where it is due.

I do not propose to mince matters but shall take the paper read, from its inception, and I think I can show without a question of a doubt, that there is absolutely no foundation for the claims which have been made concerning the early introduction of the Blastophaga into California.

It just happens that since my boyhood days I have come in contact in one way or another with nearly all the parties mentioned in their paper, whose statements would have any bearing on this matter.

It seems the Gates tree growing in Stanislaus county ten miles west of Modesto, is the pivotal tree, where the Blastophaga has dwelt in peace for so many years without accomplishing the world of good for which it was intended. Had it only been in the hands of people who had a slight inkling of what was going on in this horticultural world of ours, the entire history of the fig business in California would have been changed.

Just think of it, during all the years from 1868 until 1908, when Mr. Rixford made his wonderful discovery, the Blastophaga has been in this Gates tree. Mrs. W. F. Green, Mr. Frazier, Mr. Adams, Mr. G. C. Gates, a mining engineer living in the vicinity of San Francisco, and Mrs. Emily Ross, whose statements are verified by Mr. Homer K. Pitman, pastor of the First Presbyterian church of Modesto, and a fig grower, were all thoroughly familiar with this insectiferous fig tree, but not a single one of them ever thought it worth while to direct the attention of interested paries, like the State Board of Horticulture, Mr. Rixford, Dr. Gustav Eisen and myself, who were vitally interested in the great fig problem from as far back as 1882, until the successful establishment of the wasp on my place in the year 1899. During this period of almost twenty years there was hardly a big daily paper in California, as well as all the horticultural papers, that did not contain articles pertaining to the fig from time to time.

It is needless to mention my own experience, further than to say that I was constantly held up to ridicule, and I was the only one who persistently followed up this subject from 1887 to 1899, when the Blastophaga was finally established on my place, then the Fancher Creek Nurseries, but now known as the "Roeding Place."

Let us show in a nutshell the fallacy of the statements in reference to the Gates tree. It was planted in 1867 and from the very beginning it was infested with the winged ants as described by Mrs. Green, and as worms by Mr. G. C. Gates, the mining engineer. Why does Mr. Rixford give credence to their statement? Simply because he happened to plant some cuttings of caprifigs a few years ago on which were infested figs, and which kept in perfect condition for several months after they were planted. This was nothing unusual and did not give evidence of a single fact from which to work out such a remarkable thread of romance in reference to the Gates tree. Let us consider the matter further. We will concede for the sake of argument that this fig had mamme or wintering figs when it was planted. I know for an absolute fact that even if this were true, that it might possibly have produced a few profichi figs, and thus harbored the first generation of wasps, that it would not produce the mammoni and mamme crops and the insects would have been lost the first year after planting. I have been growing thousands of caprifigs in nursery rows and have hundreds of them in my own orchard, and also have had many trees under observation in other localities where I have sold stock, and know positively that none of the trees carried a succession of crops until they were at least four years old, and in most cases they had to be five years before they could be depended upon to carry all the crops necessary to provide a home for the wasp.

This Gates tree was an unusual sort; it carried all the crops from the date of its planting in 1867 to 1871 when all record of it was lost until Messrs. Swingle and Rixford made their remarkable and far-seeing observation in 1909.

Next in order comes Mr. W. B. West. I am pleased to say I had the pleasure of knowing him and appreciate the fact that he was a very progressive nurseryman, who was deeply interested in the horticultural advancement of the state. I don't think he ever had occasion to give much thought to the necessity of having an insect for the successful production of figs. The only contention which he ever did make, was in relation to the claims of G. N. Milco as being the introducer of the White Adriatic fig.

It is extremely doubtful that Milco ever made the claim that the so-called flies were necessary for the production of figs for the reason that in the year 1885 and for several years thereafter he not only claimed that he introduced the White Adriatic fig (which, of course, was not true), but that it was also superior to the Smyrna fig. Under the circumstances he would be the last one in the world to claim any beneficial results from the "flies," which were exhibited to Mr. and Mrs. J. D. Peters, and further, because he happened to exhibit a few flies, is it not more than likely that they were the fermentation fly, which is so commonly found on the White Adriatic? Is there any proof that they were anything else?

The wasp was established in the Lathrop trees from consignments made by me.

The Modesto tree which is also referred to, was supplied with insects from consignments sent by me to L. W. Ordway, a nurseryman and florist,

(Continued on Page 665.)

TREES

Ornamental

Our almost endless variety of stock for ornamenting small gardens, extensive grounds and Parks; for street planting and interior decoration, will appeal to every plant lover. Space will not permit us to more than briefly mention a few varietes in this column.

Roses

Beautiful, strong field grown plants; varieties adapted for hedges, grouping, climbers, etc. Known varieties of merit both in bush and tree forms.

Shade Trees

Acacias, Camphors, Pepper Trees, Grevilleas, Magnolias, Pines.

Decorative Shrubs

Altheas, Duetzias, Ligustrum, Lilacs, Spireas, Eunoymus, Oleanders, and many other beautiful plants.

Buy the Best

Eucalyptus

The ornamental value of the Eucalyptus is considerable in addition to its recognized merits for practical purposes. We have a good stock on hand including many varieties.

Palms

California Fan, Phoenix Canariensis, Erytheas, Cycas, Kentias, Rhapis. Also all varieties of house palms.

Climbing and Trailing Plants

We also call attention to our large selection of climbing and trailing plants such as Ampelopsis, Ivy and Honeysuckle; also Border Plants and Bulbous Roots.

LET US HELP YOU PLAN YOUR GROUNDS.

We have secured the services of an expert landscape gardener and are prepared to furnish plans and give advice as to the most suitable trees, plants and shrubs to use in ornamenting your grounds at reasonable cost.

Citrus and Tropical Fruits

PEDIGREED NURSERY STOCK.

Did you ever stop to figure out just why there are so many apparently vigorous and healthy fruit trees that have only a partial crop, and sometimes no crop at all? Again, did you ever see an orchard in which all the fruit trees were producing anywhere near the same amount of fruit? I have my first orchard yet to see where all the trees were producing approximately the same amount of fruit, unless it is one that I have seen which has long since reached the bearing age and as yet has not produced any fruit at all. We go through an orchard of fine vigorous trees and notice here and there one loaded with fine uniform sized fruit and the remainder of the trees grading from these down to almost no crop, with fruit that runs from fancies down to poor seconds. Did you ever stop to investigate as to the reason for this variation? One reason is poor selection of parent trees. If you were an up-to-date stock grower you would not hesitate for an instant. You would head your herd with a high-grade male and then begin weeding out the poor brood animals. The same theory can be made to apply to plant breeding.

Pedigreed fruit stock is the remedy for poor producing orchards. Of course, I am not saying that simply setting a high-grade nursery tree is a guarantee for a big crop of fruit. The same principle applies here as in livestock; that is, the tree must have care, food, and congenial climatic conditions. What is pedigreed nursery stock? It is young trees produced from parent trees that are known to have a good record for a long succession of large crops of fine fruit.

There are very few nurserymen who attempt very seriously to put pedigreed stock on the market. Some of the men who deal in small fruits advertise this kind of stock. However, if the prospective fruit grower can wait for the trees he can produce his own stock. Of course, this season is too far advanced for propagating nursery stock by budding; but for those who prefer grafted stock it is not. However, the trees from which the scions are to be taken should be selected at once, as after the fruit is harvested the owner of the trees is apt to forget just what trees produced the finest grade of fruit. If it is possible, get the history of the tree for several years back; in fact, it is very necessary to know just what kind of crops the tree has produced in the past. Sometimes a poor tree will have an exceptionally fine crop one year, then lapse into its old habit of producing small crops, or a large percentage of off-shaped fruits. What you want is a parent tree that has a record for the maximum number of big crops of perfect fruit and also makes a fair wood growth. Label these trees and when you are ready for your scions, which will be in February and March, select the terminal wood that has made a moderate growth. See to it that this wood is well matured and free from pests. Do not, under any circumstances, take the shoots that are produced from the body of the tree. By doing so you will defeat the purpose for which you have taken so much trouble. These water sprouts are unfruitful wood and will have a tendency to produce a like tree. Use only wood of the past summer's growth. Finally, it is almost as necessary to know the man from whom you are getting the scion wood as it is the tree. If he is anyways unscrupulous he might misrepresent his tree in order to make the sale of scion wood or just to make it appear that his trees were better than his neighbors.'

Collect the scion wood very carefully and keep those from different trees separate. Either put the number of the tree on the scions and keep the record in a book provided especially for that purpose, or put the record with the scions. The former method is much preferable. In grafting, bring the scions from one particular tree into the work room, and make them up. Pack the grafts in a box and record the number so that you will be absolutely certain as to their parentage; in fact, an accurate record must be kept from the time the scions are cut until the young tree is set in the orchard.

How about the orchard that has been set for several years and as yet has given no results? At the present time there are very few orchards that have anything like a uniform production; that is, all the trees do not produce anything like the same amounts. As I have said before, I have seen orchards running from 6 to 10 years of age that were not producing anything, or only a few of the trees were producing paying crops. A defect like this can be remedied if the proper care is given in selecting scions and top working the poor producers. The new top would require from four to five years to come into profitable bearing, but when it did the increased income would more than repay for the trouble.

The effect of pedigreed nursery stock on the production of apples can be readily seen. We do not doubt, for an instant, the results that can be obtained from the use of pedigreed livestock. It is only the plodder nowadays that does not attempt to improve his livestock. The time is coming when the same will apply to the orchardist or nurseryman. A few growers are already taking steps in this direction. I know, personally, one man who has a fifteen-acre young orchard of pedigreed stock, and also a large orchard company that is taking steps to establish a nursery of pedigreed stock to be used in setting its holdings.—C. A. Cole of Oregon Ag. Col. in Pacific Homestead.

PRUNING CITRUS TREES IN FLORIDA.

The pruning of citrus trees in Florida is a different problem than in California. Here the orange is cut so as to admit air and light, remove nonbearing wood and sucker growth and to a certain extent renew top and balance the tree. In Florida the control of disease is a factor as we note in the following in the Fruit and Produce News:

There are possibly no two diseases of the citrus family more troublesome in Florida than "die-back" and "wither-tip" in their various forms. Both cases require different treatment. Experience so far has taught us that the only true and sure way to cure wither-tip is by thoroughly pruning. Running over and only half pruning usually does as much harm as

good. When pruning great care should be taken to saw or cut as close to the base or trunk of the tree as possible, and to make smooth cuts and by all means do not leave any projecting stubs. This precaution should be carried out to the letter because diseases from these stubs are almost certain to occur when wither-tip fungus is present.

Another thing of great importance is cutting the branches close to the tree as the cut surfaces soon heal over, leaving a nice, smooth body; also if the trees are to be washed, or doctored, it can be executed in one-third the time! besides, it adds beauty to the trees. Nothing looks worse than an orchard all full of stubs. In cutting out limbs and dead brush always saw or cut behind the dead timber, or, in other words, always cut in the green timber as it soon heals over and prevents diseases from spreading and helps the tree to take on new life and growth.

In pruning for wither-tip great care should be taken to remove every limb or branch that is diseased, as it is important to get rid of all the poisoned branches and prevent the disease from spreading. Withertip can be distinguished in various ways—namely, as the limbs or branches on the outside turn dark brown and the outside bark will continue to get darker until they are dormant, while the inside bark near the body of the tree will keep continually falling and the leaves will turn yellow and in a short time the limbs will be bare. Trees that die from this disease soon become very brittle and rot in a short time. When the trees are taken with withertip, if fruit is on the tree, it can be noticed by the fruit dropping to the ground.

There are various forms of "die-back," and various causes. First, too much water; second, drouth; third, too much ammonia in the soil. This seems to be the main cause as a general rule, caused by using high-grade ammoniated fertilizers. When the trouble is from too much ammonia, only phosphoric acid and potash or salts of potash should be applied and in a short time the excess of ammonia will be used up and the tree will return to its normal condition. Every form should be treated differently. I will not enter into details on the various forms of die-back in this communication, or the cure, as it will take too much space.

CARE PAYS.

Commenting on the profitableness of care in packing which Florida growers are learning, the Fruit and Produce News says:

Now, the Florida orange is thinner skinned and juicier than the California navel, and consequently deserves even better treatment. That Florida oranges in general have a reputation for poor keeping quality may not rest wholly with the orange. If it was given the show that these California navels received it might prove itself in a way that would surprise the natives. That great improvement can be made along this line has already been proven by Mr. Temple. He states when he first began to ship his oranges to the New York auction that his average was at least 30 cents below the average received for other Florida oranges, but after he built his new house at Winter Park and began to handle and pack oranges as they should be packed and handled, he brought his average up to nearly a dollar a box above the average market price for Florida oranges. Remember this was done in the open market where no favoritism can be shown, so that no one can claim that he was favored because he was an Exchange official.

A PEST OF THE MANGO.

As the mango is becoming somewhat of a factor in California Horticulture the following from a letter of Assistant Chief Marlatt of the Bureau of Entomology, has points of interest:

The most serious insect pest of the mango in oriental countries is the mango weevil (Cryptorphynchus mangifera Fab.). This weevil is classified with the boll weevil and the chestnut weevil, which, aside from its well-known destructive work on the mangoes is sufficient indication of its undesirability. It is probably of Indian, or at least of oriental origin, and has already obtained foothold in most of the important mango growing countries, being carried readily with seed for planting. It now inhabits all of the mango regions bordering on the Indian Ocean and adjacent islands, and throughout the East Indies, including the Philippines and other groups of South Pacific islands. It has gained foothold similarly in South Africa and Madagascar and numerous other points. Fortunately this country is so far free from this pest, and if it can be kept out the mango industry which it is hoped to develop in Florida and perhaps in the other warmer parts of this country can be given a very great advantage over other mango producing regions of the world.

As already indicated, this mango pest belongs to the weevil family. The egg is deposited in the fleshy part of the fruit, where it hatches, and the young grub burrows at once through the seed itself and develops there into the mature beetle. The green mango soon heals up over the egg slit, and there is very little if any exterior indication of infestation. The weevil or beetle developed in the seed is about a quarter of an inch wide and an inch long and dark brown in color. It remains in the seed for some time, and may thus be easily distributed with seed for planting or with the ripened fruit.

Protected as it is by the tough seed coats and, in fact, buried in the seed itself, it is not possible to destroy it by fumigation with any certainty. The only means of determining infestation is by opening the seed pod and removing the papery covering of the seed itself, when, normally, the gnawing and excrement and discoloration due to the work of the larvae and the weevil which develops from it can be noted. Therefore, it is manifestly a very dangerous thing to import into this country in regions where mangoes are grown any foreign grown mango seeds or fruits. Where there is no mango fruit, the danger, of course, is perhaps negligible, as no other food plant is known for the mango weevil. Still if large numbers of these weevils should be introduced and liberated, they are long lived and might easily be carried on railway trains to regions where they might make lodgment. It is, therefore, desirable, should planters wish to import seeds for planting, that they make special arrangements to have them inspected on arrival by competent authorities who are familiar with this dangerous pest.

It has already been stated that this mango weevil is the principal enemy of the mango, practically wherever this fruit is grown. In the Hawaiian Islands Mr. Von Dine, formerly Ento-

LOS ANGELES, CALIFORNIA

LARGEST CITRUS NURSERIES IN THE WORLD

Parties contemplating the planting of citrus groves this coming spring will do well to send for our prices soon, as there will evidently be a shortage of strictly first class stock. Write today for particulars, or, better still, pay us a visit so that we may be able to show you just what we have.

Our finely illustrated booklet, "Citrus Fruits," covering the industry from the seed to the market, mailed to any address on receipt of 25c in stamps.

SAN DIMAS CITRUS NURSERIES
San Dimas California

Pioneer ROOFING

Looks Better—Lasts Longer—Costs Less

If you want the maximum of roofing service at a minimum cost, be sure you specify "Pioneer Roofing." It's better from the beginning and cheaper in the end. Sunproof and rainproof. Needs no paint or repairs. Comes in convenient rolls, with everything necessary for laying.

Let us send you samples and prices. Also 32-page illustrated Roofing Booklet. Address Department 11

Pioneer Paper Co.
219-221 So. Los Angeles St. Los Angeles, Cal.

GRAFTED WALNUTS

San Jose Mayette and Concord; blight resisting. Best commercial nuts; send for samples. Eucalyptus Trees, no better stock grown; prices very reasonable. General Fruit Tree and Ornamental Stock. Our 1911 Horticultural Calendar now ready, price 15 cents. Catalogue Free. Thirty-four years' experience in California.

LEONARD COATES NURSERY CO. Inc.
Morganhill, California.

FLORIDA SOUR ORANGE SEED.

Put in your orders for Florida sour orange seed before the first of the year and be sure of getting your seed. We are collecting personally our own seed. A deposit of one-half required. Address OTIS E. HYDE, 1314 West 51st St., Los Angeles.

mologist of the Hawaii Experiment Station, reports that the first year of his examination he found 60 per cent of the mangoes infested; the following year 80 to 90 per cent, as many as four larvae being found in a single seed. While the mango weevil destroys primarily the seed of this fruit, it is also believed by growers that it hastens the maturity of infested fruit and cause a greater percentage of them to fall.

Inasmuch as this insect passes its entire development within the seed. it is beyond the reach of insecticides and fumigation, and the only remedy is to collect and destroy all of the fallen or supposedly infested mangoes.

It is most urgently important now, however, for Florida to keep this weevil out. Mango seeds are now probably being imported into Florida by various growers, and the danger of such importation should be thoroughly understood, and whatever authority the state may have to prevent or control such importations should be put in operation.

CITRUS PESTS IN FLORIDA AND CALIFORNIA.

By A. W. Morrill, Entomologist, Arizona Horticultural Commission.

The prominent citrus pests established in this country belong to groups of insects commonly called scale insects, whiteflies, thrips and mites.

The group of scale insects, or the insect family Coccidae, is in scientific literature divided into several subfamilies, but only two main divisions will be mentioned here. Those which, after hatching and settling down to feed remain practically stationary throughout life and secrete a shield-like or scale-like covering which affords protection to the insect, are known as armored scales. The citrus pests belonging to this group are known by the following common names. Purple scale, long scale, Florida red or circular scale, California red scale, yellow scale, oleander or lemon scale (not the same as the soft scale, which is in Arizona often called the oleander scale) chaff scale and orange Chionaspis. Of the foregoing list, all except the yellow scale are found in Florida and all except the chaff scale and orange Chionapis occur in California. As will be shown in later numbers of this series of circulars, not everyone of the insects which occur in both states is considered a pest in each. In Florida, the principal armored scale pests are the purple scale, the Florida red scale and the long scale; in California, the red scale, the yellow scale and the purple scale are the worst pests of this group.

Those scale insects which retain their power of locomotion throughout life and secrete no protective covering, or at the most only a covering of loose wax, may be grouped for convenience under the name of unarmored scales. The insects in this group are not all as closely related as those in the preceding group. The common names of the unarmored scales which infest citrus trees are: the soft scale, black scale hemispherical scale, barnacle scale, Florida wax scale, cottony cushion or fluted scale, and the citrus mealy-bug. All of these pests occur in both states, with the exception of the Florida wax scale, which has never been found in California except in quarantine.

All scale insects, both armored and unarmored, when mature, are provided with wings only in the male sex. These winged males are very inconspicuous and are rarely noticed by the casual observer. Owing to their wingless condition the adult females are not a factor of any importance in the spread of scale insects from tree to tree.

The whiteflies or insects of the family Aleyrodidae resemble scale insects very much in their appearance and method of devleopment, except that the adults of both sexes are winged. The spread of these insects from tree to tree and from grove to grove is consequently more rapid than in the case of the scale insects, making their control a more difficult problem. There are several species of whiteflies which occur on citrus trees in the United States, but of these only three have thus far proven destructive. The two most destructive are well established in Florida, and are known by the common names of citrus whitefly and spotted wingfly; the third has recently been introduced into the same state from Cuba and may be called the Cuban whitefly. The first two species have each been introduced into the state of California, but the spotted-wing fly is believed to have been exterminated there.

Only one species of thrips, Euthrips citri) has thus far proven a citrus pest. This species is widely distributed in the citrus growing regions of California and Arizona, but thus far has not been found in Florida. The species of thrips which occurs so abundantly in citrus blooms is not the injurious species, but a closely related one, according to the agents of the United States Department of Agriculture who have investigated the matter. Thrips are usually minute insects, with slender bodies. Individuals are not conspicuous, but when the insects are abundant their presence is readily detected. The citrus thrips is provided with wings and presumably can fly, although a nearly related species which has been studied by one investigator rarely if ever uses its wings.

Mites, the last group referred to in the opening sentence, are more closely related to spiders than to true insects. They are wingless and usually have four pairs of legs instead of three, as do true insects. There are three species of mites affecting citrus, and all three are found both in California and in Florida, being known as the rust or silver mite, the six-spotted spider, and the red spider. These pests are minute in size and cannot be recognized without the aid of a magnifier.

It may be well to mention, in addition, an insect belonging to a group not heretofore referred to. This is the Morelos orange worm of Mexico, which belongs to the insect order Diptera, or two-winged flies, to which also belong the housefly and mosquitoes. The maggot of this pest infests the pulp of the fruit, producing a condition comparable to, but much more objectionable than, that caused by the codling moth to the apple. Fortunately the orange worm does not occur in this country.

Many orange-packing houses which were rushed with fruit-packing a couple of weeks since are now idle. The Chino Sugar Factory is now shipping out seeds to those who have contracted to furnish beets.

Much grain is being drilled in Eastern Riverside county.

The Ornamental Garden

THE LAWN OR YARD.

In planning a new home, if you prefer a large lawn to a small yard, do not hesitate to lay out the preferred tract of land, for a large lawn will "raise" more pleasure than it would wheat or corn.

But whether the farm yard be large or small there is no reason why it should not be beautiful.

Let the up-to-date farmer seed his yard to grass, clear up to the front and back door, the same as the up-to-date townsman, and let the grass at all times be mowed down short.

Country people love grass as well as city people, but they seldom have it until they move to town.

I happened at the home of a retired farmer the other day. The family resided in a fine, comfortable residence, and the yard was beautifully seeded to grass. The thought came to me that this man would never have lived that way had he remained on the farm. But why not? Why not live the same on the farm as in town? And, best of all, on the farm, when you slip out in your own yard to bask in your haven of rest, the critical eyes of your neighbors are not peering at you.

Why not prepare a haven of rest down on the old farm, and remain there to enjoy it, and at the same time induce the children to love it

There should be a generous supply of shade trees and evergreens in both back and front yard. And, as a rule, the trees would look better set in single specimens and in irregular groups instead of in stiff rows. The trees should not be set so as to hide the dwelling; but so there should be a good view of the residence from the road, and a good view of the sun from the kitchen.

At a very small outlay of pocket change a nice variety of trees might be purchased, and with good care the trees will soon reward you with a rich mass of magnificent beauty. The lawn should also be planted to a nice variety of flowers. Flowers are essential to a well planned home.

The care of flowers is pleasant and instructive work, and it is work that pleases almost every woman and girl. Begin with a few flowers and learn their culture, and yearly add more, until your bare, unsightly yard is an earthly paradise.

In many localities, flowers are to be had for the asking; but if you have no good neighbor from whom you can get flowers and shrubs, for real quality and beauty expend a small sum each year for flowers until you have sufficient flowers to beautify your home. In getting and putting out flowers and shrubs, do not make the mistake of getting too many. Just a few look much better than too many. And, many or few, they must be well cared for to look well.

Put up swings and hammocks in the yard. Most any farmer can afford a good strong rope for a swing. The swing can be put up on one or two strong projecting limbs, or on a stout pole resting in two trees; the higher the better, if the children are large. There should be a few yard seats. These can be made at home by someone handy with tools.

Good walks should be put in where needed, of gravel, boards, brick or cement.—Kansas Farmer.

PRUNING OF ORNAMENTALS.

There are certain well-founded reasons for pruning flowering shrubs and hardy vines. It may increase vigor, just as in the case of a currant bush or a fruit tree. When the branches become crowded and, as a result, weak, a judicious thinning will let in light, prevent physical congestion and restrict the food supply to a smaller number of shoots. The cutting back of the annual growths permits the stronger buds to develop, for it is usually true that those at the very extremity of the branch, when the season's growth is indeterminate, are much weaker than those some little way down the stem. Hence this cutting tends to produce stronger lateral shoots and larger and better flowers. In addition, there is a considerable increase in the amount of the flowering wood. There is a distinct advantage in removing from time to time all dead and decaying and all interfering branches. In these instances the benefits are so obvious and the practice so universal that further comment is unnecessary. Although it is not well understood, it is true that a shrub can be kept in good conditon for a longer period of time than nature would allot if some of the older parts are occasionally removed. This needs to be done only when the plant has reached maturity and should be guided by the relative healthfulness of the different shoots and the need for preserving the natural form. This last need in itself is one of the most legitimate of the reasons for pruning. Careful consideration will always reveal something that may be done to assist nature's lines. Abnormally vigorous growth, straggling shoots, and injured branches may at least be removed.

Here it may be proper to mention the formal shearing of hedge plants. The beauty of such a hedge consists in its thickness and uniformity, and in the denseness of the foliage, and whatever contributes to these results is justifiable. This is quite different from trimming shrubs into shape, getting them into the form of a cone or hemisphere, each exactly like its neighbor.—St. Jo. Fruit Grower.

FLOWER INDUSTRY IN FRANCE.

The Syndicat des Horticulteurs gives the production of flowers in the Nice district in 1909 as 7,550 tons, valued at $5,790,000, the industry employing 18,600 persons. Two special trains transport these flowers daily to Paris, London, Berlin, and St. Petersburg, during the season. The flowers are packed in light willow baskets weighing either 6½ or 11 pounds, and are forwarded to their destination by parcel post. The flowers cultivated for export are chiefly carnations, violets, and anemones, while orange blossoms, tuberoses, and jasmin are most extensively used in the perfume factories at Grasse. The production of flowers being more remunerative than farming is the principal reason for the large imports of dairy and farm products into Nice.

In the flower gardens a man earns about 60 cents a day and a woman 40 cents, and in some cases less. A girl flower picker in the district of Grasse earns 20 to 25 cents a day.—Report of Consul William D. Hunter, Nice.

CITRUS GROWERS! ATTENTION!

We can furnish you the finest Orange, Lemon and Pomelo stock in the state, including all leading types. Strong, thrifty guaranteed trees.

INTRODUCTION OF BLASTOPHAGA.

(Continued from Page 659.)

she was at the Gates place many times and tried to find edible figs on the capri tree. She is positive in her statement that they were "full of little black winged ants."

This evidence takes us back to a very early date and is to my mind absolutely conclusive. Sincerely yours,

(Signed) Homer K. Pitman.

This testimony is particularly strong because of the fact that Mrs. Ross moved away from the vicinity of the Gates ranch in January, 1871, and therefore could not possibly be mistaken as to the date when she noticed the fig insects, which must have been in 1869 or 1870, or during both years.

Mr. Louis Adams, the original owner of the Gates ranch and who planted the tree, was found by one of the writers and states that he secured a fig tree as well as his other fruit trees from W. B. West of Stockton. He planted the trees in 1867 and sold the place to Mr. Gates the following year. He did not know about the fig insect and does not remember whether the capri tree carried fruit when set.

The evidence presented briefly above shows beyond the possibility of a reasonable doubt that the Blastophaga has lived in the Gates tree for at least forty years, but it does not clear up the mystery of how the Blastophaga got to the isolated Gates ranch.

It now seems probable that W. B. West, who was a progressive nurseryman and known to be much interested in figs, must have imported cuttings that carried the mamme or winter generation fruit, as such cuttings often do when taken from old trees. One of the writers planted last December in San Francisco cuttings from the Maslin orchard at Loomis with mamme attached. On the first of May following the insects were in good condition and about ready to issue, but the weather becoming warmer the figs dried up and fell off. From this it is evident that the Blastophaga can live on unrooted cuttings for five or six months.

In the spring of 1889, Mr. H. E. Van Deman, then Pomologist of the United States Department of Agriculture, introduced the Blastophaga into this country in this manner without any intention of so doing. It is probable that the insects reached Mr. West in this way and established themselves without his knowledge in the Gates tree before it left the Stockton nursery in 1867.

One of the writers has hunted up quite a number of old capri trees which he believes were, with few exceptions, derived from the same source, namely the nursery of W. B. West of Stockton.

Within four miles of Lathrop, San Joaquin county, are two old capri trees, one on the ranch of Geo. E. Salmon and the other on the adjoining ranch, recently purchased by W. W. Rimby. These trees are very old and that on the Rimby place was about as large as the Gates tree before a large limb and one-third of the trunk was split off by the wind a few years ago.

James Turner, now living near Lathrop, sold the ranch to Edward Cail in 1861. In an interview a few days ago with the widow of Edward Cail, now teaching a district school five miles from Lathrop, she stated to one of the writers that she married Cail and went to live on the ranch in 1885. The tree was large at that time. She distinctly remembers trying to find edible figs on the tree, but that they were full of those little bugs.

Old residents of the locality assert that these trees were planted more than forty years ago. Mrs. McKenzie, widow of a pioneer, with her husband settled on the ranch adjoining the Salmon place in 1864 and says the Rimby tree was planted three or four years after. Mr. Salmon has lived on his place since 1898 and was familiar with it several years previously and is positive that the two trees have carried an over-wintering crop since 1880. Mr. Edward Reynolds, a neighbor, is sure that the trees have carried mamme through the winter for more than twenty years.

In Stockton, Mr. C. W. Logan (corner Oak and Union streets) has seven capri trees from which large quantities of profichi have been taken during the last three years by Smyrna fig growers of the San Joaquin valley. The largest of these is over four feet in circumference two feet from the ground. They were planted many years ago by Dennis Crane, according to Mr. Joice, a neighbor, about thirty-eight years ago. He says that they have always carried an overwintering crop. Matthew Crane, son of Dennis Crane, now living in San Francisco, says his father bought the place in 1865 and the trees were planted between 1866 and 1870. He is positive that they carried a mamme crop as early as 1868.

At Merced on the Dwyer place there is an old capri tree that was planted at least 30 years ago, but not infested until last spring when the insects were sent in some capri figs secured at Ripon by one of the writers. The profichi from this tree, like most caprifigs when not infested by the wasp, are sweet and edible.

Within two to four miles from Ripon, San Joaquin county, are thirty old capri trees growing on the farms of Mr. Watkins, Judge Preuitt, Mrs. Frederick, Fred E. Kincaid, John Riddelle and Frank Hutchinson. Most of these trees were stocked five or six years ago by Geo. C. Roeding and are now producing great quantities of profichi which are purchased by the Smyrna fig growers of the San Joaquin valley. These are very old, some of them with trunks over two feet in diameter and are all of the same stock.

In the vicinity of Milton, Calaveras county, are twelve old capri trees, none of which are infested, with the exception of one on the Rhodes Bros. place which was caprified with caprifigs sent by the writers from the Loomis orchard last spring.

They were planted by Robert Cooper, James Williams and Samuel Hayes, brothers in law, sometime between 1868 and 1870. They are all alike and the same as others from the West nursery at Stockton. They are growing in fields and about old deserted homesteads. The fruit when ripe is sweet and quite palatable, like the profichi of most capri trees, and what escapes the birds is eagerly devoured by stock.

At Vina on the Governor Stanford ranch, are four old capri trees, probably planted in 1881-1882, at the time the cuttings from the Bulletin importation were put out, the governor having had a large number of the cuttings, mostly of the Smyrna type. One of these caprifigs is of the Milco variety. The Blastophaga was established on these trees, as well as on several other capri trees in the county, seven or eight years ago by Mr. W. Herbert Samson of Corning, California. The old Smyrna trees, some of which have trunks two feet in diameter, are producing bountiful crops of luscious figs.

There is one capri tree at San Rafael, Marin county, on a place owned by Geo. D. Shearer, and two at Los Gatos, Santa Clara county, owned by Mr. Boyd. These trees which look to be about 30 years old, were infested with figs sent from Loomis last spring. These and a large number of capri trees in many different localities in California, Arizona and the Hawaiian Islands have been infested with Blastophaga in accordance with the plan of the bureau of plant industry of the United States Department of Agriculture, in order to provide against the possibility of the loss of the insect through frost or other cause, as sometimes happens in the Smyrna fig districts of Asia Minor and Greece.

A careful examination of all these old capri trees and comparison of the fruit shows that with the exception of the San Rafael tree and two or three at the Vina ranch, they are of the same variety, namely, the one which somebody in this state has called the Milco after the late G. N. Milco of Stockton.

It has also been distributed under the name of Endrick, though most of the nurserymen catalogues of 1865 to 1880 describe the Endrich as a white edible fig. Mr. Geo. C. Roeding, who has studied many of these old capri trees, is also of the opinion that they are of the Milco variety, but does not believe that it was imported by Milco, as claimed by some, while it is almost certain that it was imported by W. B. West.

In 1865, according to Dr. Eisen,

W. B. West imported by way of the Isthmus, the overland railroad not having been completed, 22 varieties of figs from the south of Europe. It is reasonable to suppose that the Gates and other old trees were of this importation and came with the figs of the mamme crop attached and that the beneficent insect upon which the whole Smyrna fig industry rests was in this way first introduced into the new world. Mr. Fred M. West of Stockton, who died within the past eighteen months, was from 1861 to 1868, a partner in the nursery business with his brother, W. B. West. In answer to an inquiry of one of the writers, he stated that if "we imported the caprifig tree and the Blastophaga it was purely accidental, as we knew nothing of the tree nor insect, but supposed that we were importing and distributing a choice Smyrna fig."

Had the facts we now bring to light been known thirty-five years ago when there were hundreds of enthusiastic growers of the Bulletin Smyrna fig trees scattered all over the state, there can be little doubt that this country would have ceased to import Smyrna figs twenty years ago and some millions of dollars would have been paid to the California growers instead of being sent to Turkey.

Had the fact been discovered fifteen years ago, when strenuous efforts were being made to introduce the Blastophaga and when the sterility of the Roeding and other Smyrna fig orchards had been rightly demonstrated to be due to the absence of this insect, there can be little doubt that a shrewd operator could have disposed of the Gates trees and its swarms of beneficent insects for a sum well up in four figures.

As further evidence of the early introduction of the Blastophaga we may mention a very intelligent and well-known lady of Stockton, widow of the late J. D. Peters, said to one of the writers that she was one day in her husband's office when G. N. Milco came in and showed her and Mr. Peters a number of figs containing "little flies," without which Milco said Smyrna figs could not be grown. Being asked if she could give the date of this incident, she replied she could not say exactly, but that it was one or two years before Mr. Peters built his new building on Channel street. The building bears the date 1888 cut in the stone coping. This definitely shows the existence of the Blastophaga in this state in 1886 or 1887.

After all, the chief lesson to be learned from this remarkable history is the necessity of a scientific understanding and appreciation of facts to render them of any practical value.

Two practical questions are being given attention: First, the precocious bearing of the Gates capri tree, if it is maintained in other places, is likely to render it a valuable variety to set out in young Smyrna orchards, for most varieties of caprifigs do not carry the Blastophaga all the year around when they are young. Mr. Samuel Gates has presented a quantity of cuttings to the Bureau of Plant Industry, which with other valuable caprifigs will be sent free to anyone who will plant three seedling figs for each cutting received.

The second question is whether the Blastophaga in the Gates and other of the old trees are in any way different from those brought from Algeria in 1899 and in particular whether the Gates tree and any other tree that may have been infested from it are free from the messmate Philotrypesis, which infest most of the capri figs of the Old World. These harmful insects did not get established when the Algerian Blastophaga were introduced and from careful examination of the fruit of hundreds of capri trees, it is confidently believed that the Philotrypesis has not obtained lodgment in this state. This is a matter for congratulation, for in Asia Minor the fig wasps are crowded out to such an extent that the Smyrna fig growers are obliged to use a much greater number of caprifigs with which to fertilize their trees than do the California growers. Fig growers are cautioned not to import caprifigs from oriental fig districts for the risk of introducing this harmful companion of the Blastophaga is too great.

PLAIN FACTS OF FIG WASP.

(Continued from Page 659.)

who forwarded me samples of the spring crop, saying the tree would never carry its figs. I informed him it was a caprifig, and forwarded figs colonized with Blastophaga, and ever since this time it has retained the insect.

Now for the last prop. It just happens that the Logan trees which are located in the city of Stockton, and not over a mile away from W. B. West's nursery, never had the Blastophaga until the insects for colonizing his figs, were obtained from me by Mr. Chas. A. Chambers, business manager of the Fresno Nursery Co. The correspondence between Mr. Chas. A. Chambers and Mr. C. W. Logan dates from March 17, 1908, in which Mr. Logan refers to a number of trees growing on his place in town as follows: "I have about a dozen old fig trees, they are loaded each year with white figs which never mature. They grow large, and about when they should ripen, drop off, so I suspect that they are in need of the Blastophaga." Two days after this letter was written samples of the figs were forwarded by Mr. Logan to Mr. Chambers, who brought them to my office for identification. On examining the figs I pronounced them capris and at Mr. Chambers' request, supplied him with a number of mamme figs which were forwarded to Mr. Logan.

For the last two years I have bought from Mr. Logan all the mamme and profichi figs which could be spared from these trees. Mr. Logan informed me that the trees never retained their fruits until he secured the infested caprifigs from Mr. Chambers.

I want to say further that the caprifigs in the Stanford ranch were colonized by wasps forwarded by me to Mr. W. Herbert Samson. That I personally established the insect in the caprifigs at Niles, also in the trees on the Van Lennep place at Auburn. That the wasps were introduced into the Maslin orchard at Loomis, now the U. S. Government Experimental Station, from a consignment forwarded by me to Mr. Mazal, who had the place rented at that time. I can mention numerous other places to which I forwarded caprifigs without charge, and in many cases where at my own expense I personally conveyed the figs and gave instructions how to care for them.

As to the Van Deman importation, I wish to say that none of the caprifigs he received were ever forwarded to California. I have a letter from him later, in which he expresses his regret in not knowing that I was an interested party.

Another strange feature in connection with the Gates tree, is that Mr. Watkins and others at Ripon, who have trees which are not much over five miles from the Gates tree, showed no signs of infestation until colonies of wasps were actually placed in these trees.

How different has been my own experience. The year following the introduction of the insect on my place, it found its way into Roeding's Capri No. 3, growing on the vineyard of Mr. F. M. Roessler, five miles northwest of my place. I was not aware the tree was growing there, and my attention was first drawn to it by samples of figs brought to my office in the month of March.

Is it not a striking coincidence that the Gates tree should also have escaped having the parasite "Philotrypesis" introduced into its figs?

The version of the early settlers on the Gates ranch reminds me very forcibly of an experience of mine while visiting the fig bazaar in Aidin, Asia Minor, in June, 1901. I opened a caprifig which was full of Blastophaga as well as its enemy the Philotrypesis. I showed the fig to an old Turk, who had been engaged in the growing of figs all his life. He informed me with much gusto that the parasite was a most wonderful and valuable worm, in fact, the best of all.

Poor Blastophaga, you for whom I worked and strived; is it possible that the ridicule I endured, the care of a sixty-acre fig orchard for a period of fourteen years without any returns, the sending of a special agent to Arizona; the effort to secure one of your tribe from Mexico, through the recognized entomological explorer, Mr. Koeble; the plowing and harrowing I gave the U. S. Department of Agriculture to awaken an interest in this subject; the investigations by Dr. L. O. Howard and his able assistant, Mr. A. E. Schwartz in fully elucidating the most complicated entomological and botanical problem of the day; was all for naught? Is it possible as a poor despised worm, ant and fly you have resided in Stanislaus county these many years? Oh! that I could believe it.

SWIFT'S

ARSENATE OF LEAD

For

Codling Moth, Canker Worm, Bud Moth, Pear, and Cherry Slug, and all leafeating pests.

Perfect Protection

One orchardist writes that after using Swift's Arsenate of Lead, he found but sixty-four apples affected by the codling moth out of 1141 boxes, or 1-200 of 1 per cent.

Does not scorch or burn no matter how strong it is used.

In 1 lb., 5 lb., 10 lb., 20 lb., 50 lb., and 100 lb. packages.

SWISS GOATS AT SAN LUIS OBISPO COUNTY FAIR.

By R. M. Cartwright, San Luis Obispo.

At the recent county fair held in San Luis Obispo, District Number 16, it was interesting and encouraging to note the comments passed by the Swiss people on the exhibit of Swiss goats (both grades and imported) that were the property of Miss B. A. R. Stocker and R. M. Cartwright. The usefulness of the "cow diminutive" and the pleasure derived from handling her was a constant topic. It is common experience that a yield of three to five quarts of milk a day is a very ordinary record for these little cows, at a maximum cost of considerably less than five cents a day. And when it is considered that they weigh less than one hundred pounds, it is a wonder how they do it. For a constant supply of unpolluted milk the goat takes the lead regardless of economy wherein she surpasses.

She is cleanly and quiet. No filth to fall in the vessel while drawing the milk and no vicious stinging tail to punish one on hot summer evenings.

The doe most admired by those Swiss people coming from the southern borderline of Switzerland was "Zeta," a beautiful black and white spotted Alpine. She was said to be the pure dairy stock—the perfect dairy type. She is about twenty months old and gave when fresh at her first kidding nearly three quarts in twenty-four hours, and this yield in the regular order of events will increase until her sixth or seventh year. Next kidding we have reason to expect better than a gallon a day. She will bring kids by Andreas Hofer.

Representative of the Toggenburgers was a doe and her pair of eight months old kids. One of these, the buck, at six months old, measured twenty-six inches high at the withers and was of relative proportion in all parts. The dam is one-half Toggenburger and gave three quarts at this, her first kidding. Great things are expected of the kids. They are all three well marked and have that shade of brown so difficult to describe but so easy to remember if once seen. It is referred to as "dark drab," "light brown," and "mouse" color, and as we know, none of these do it justice. As a breed they are very beautiful, probably the best known, and because of their greater numbers will continue the most popular of the Swiss breeds in California for some time to come.

The Saanen stud buck, "Andreas Hofer," was the cause of more constant wonder and continual consternation among the ladies and children who thought that he should be petted, than all other exhibits combined. It was even questioned by some if he were a goat. And Swiss men informed us that he was an exceptionally good representative of his breed. The Germans purchase them to improve their own stock. And well they may, when we realize that Andreas Hofer in this state has achieved results equalled by no other buck of any breed—the production of four and five-quart does by Angora dams! He is a giant, vigorous and prepotent. He can lift his nose more than eight feet from where his hind feet rest. He stands thirty-eight inches high at the withers. Fifty dollars will be paid for the best five-months-old kid that he brings this breeding season. They will be judged by photos and measurements of his kids from all over the state.

As a matter of investment the goat stands unrivalled save by the promises of various prospectuses. A man in Oakland paid forty dollars for a doe. He rents her by the month at ten dollars a month. The milking period runs close to ten months. What a return for such an investment!

During the fair, application was made time and again for does in profit. The babes we saw, and it was to our sorrow that we could not supply them. The goat's milk is so like mother's milk that it requires little modification. It is even told how in Switzerland the doe is given the babe in charge and so trained that hearing the infant's hungry cry she will come running and allow the babe to take the milk directly from the teats. What an idea for Rooseveltian inclined families!

Does in profit are not for sale. But when they are offered they find a ready and quick sale. A doe kid, bred to a good buck, is the best investment, bringing milk for the folks and kids for profit. Kids sell for twenty dollars up to say fifty dollars for grade kids—higher for thoroughbreds. They will bring an abundance of milk at a cost of a great deal less than five cents per day for feed—all purchased.

Swiss goat's milk shows a test of from three and five-tenths to four and five-tenths per cent butter fat. Angoras and Swiss-Angora crosses run one to three per cent higher. The curd is very tender when raw or when prepared as delicious schmierkase. For these reasons physicians are recommending it more and more for infants, invalids, and as a domestic milk supply. Since tuberculosis is very rare among them they are even more urgently recommended.

The Swiss goats are practically the only imported goats of the milch breed to be had here now. Rumors have come to us of a very superior goat on the Azores Islands, whose yield often exceeds eight quarts daily. The quarantine law of the United States forbids importation from this point or any other in Continental Europe, and we feel serevely handicapped for lack of good milch stock. The time is eagerly anticipated when importations can be made. The State University is cognizant of the increasing demand for goats as well as the source of the deep interest evidenced by the many inquiries forwarded to other goat enthusiasts throughout the state.

The sooner the authorities, either state or national, get for us the power of bringing animals from these points even after investigation however searching the sooner will the time approach when in-breeding and cross-breeding will be and can profitably be discontinued. Mates for our best stock are wellnigh impossible to get. Some of us will gladly be "counted in" for our share of making such an importation which will give the milch goat breeding industry a boost in California.

AN ITALIAN PROVERB.

The Italians have a proverb which, translated into English, is as follows: "Wife and stock, select at home." Like many other proverbs, it presents only part of the truth, and is not of universal application, says an editorial in Wallace's Farmer. There is great good sense in the proverb applied to the choice of a wife; for if two are to make the greater part of the journey of life together, it is of the utmost importance that they should know each other before making a hard and fast engagement; and they are more likely to know each other if they have the opportunity which neighborhood association affords. In forming marriage engagements we are more likely to follow the ideal than the actual, and there is often disillusionment (very serious and sometimes humiliating) when folks who marry without intimate knowledge of each other are obliged to put up with the actual and put the ideal away as a beautiful but unrealized dream.

On the other hand, no young man should feel obliged to take choice of what the neighborhood offers, unless the neighborhood is of a high character; that is, provided the young man has high ideals; and vice versa.

Neither must the maxim to select stock at home be taken in all literalness. The word imported has a wonderful charm for people who have not studied live stock conditions in other countries. The assumption that unless an animal is of superior quality it would not have been imported is often without foundation. On one of our visits to Scotland, we heard a description given to a certain class of horses, for which we could not understand the reason. They said: "This is an American horse." We asked, "What do you mean by an American horse?" The answer was: "We mean a horse that is good enough to ship to America, but not good enough for a dray horse in Glasgow." This was long ago; but it reminded us forcibly of a number of imported horses that we had seen, which answered quite perfectly this description. They were sent abroad because they were not good enough to be kept at home.

The United States has now reached a point when it should be able to produce as good live stock as can be produced in any other country on the face of the earth; not in every locality, but in some localities especially fitted for their production. We are under great obligations, however, to other nations for imported stock. We owe a great debt to England, to Holland and to France; but we have now reached a point where nothing should be accepted that is not of unquestionable superiority and undoubted lineage. In other words, we have reached a point when the utmost encouragement should be given to our home breeders, and the term "imported" should not be regarded, as in the past, as guarantee of superior excellence. The animal itself must prove that excellence, not by a certificate of importation, but by standing the tests which stockmen apply, or at least should apply, to all classes of animals, whether imported or of home growth.

In purchasing live stock, whether at home or abroad, we should keep in mind both environments. The animal is largely the creature of environment. There were breeds before there were breeders; and the breeders have simply perfected that which the environment first created. We must not expect to maintain the quality of stock of any kind unless we furnish them an environment, either natural or artificial, that will maintain and if possible improve the quality.

We have seen men vainly trying to make like produce like, after taking an animal from a superior environment to an inferior one; and we have never yet seen it succeed. We can safely remove stock from an inferior environment to a superior, and improve them until they measure up to the environment. Part of this environment is natural: soil, climate, superior grasses. Part of it is artificial: the care, the shelter, the indescribable something which we call skill or faculty on the part of the breeder—the judgment which enables one man to mate with surpassing skill, and the lack of judgment which frequently causes one man to fail where another in a precisely similar outward environment succeeds.

There is something in the really first-class breeder that approaches genius, something which can not be adequately described. If this genius continues from generation to generation, which it does not always nor often do, then we have a live stock farm from which a man can safely buy at apparently long prices. It is surprising, the genius of some of England's great men and great families, that have given us the best in some of our breeds of cattle. It is the lack of this genius in many cases that causes cattle to be sold more on reputation than on merit.

Therefore, give heed to the Italian proverb and follow it, but only so far as it is practicable and likely to lead to the best results. We might sum it all up by saying: Whether in wife or live stock, select at home if you can do as well there as away from home; but in any case know what you are getting, so far as that is possible.

AUTOMOBILE VS. HORSE.

I wish to take exceptions to the first cost claim of the Maxwell company of "Automobile vs. Horse." They place the ocst of horse, buggy and harness at $375.00, which I think excessive. The average distance driven per day, 33 miles. Now a good average driving horse should walk four miles per hour, or 32 miles in eight hours.

They place hay at one cent per pound, which is fair, but they put straw 1½ cents per pound, which is excessive, as I see straw quoted in your market report, San Francisco, at 40 to 50 cents per hundred pounds. You also quote hay, Los Angeles, at $10 to $14, and oats at $1.80. So their feed bill is excessive all around, while the performance might be covered with any old skate.—Constant Reader, Redlands.

If the horse has defective feet keep them carefully trained and shod, if necessary. The soft hoof should be shod and reshod every six or eight weks in winter where the ground is frozen, and at all times of the year where the roads are rocked or graveled. By keeping the horse with poor feet properly shod it will do good service without loss of time. It is best, however, to breed for good feet.

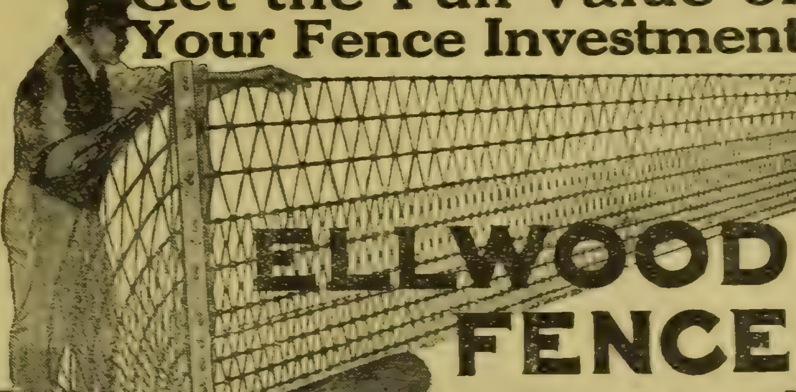
Get the Full Value of Your Fence Investment



HOW? Use good corner and end posts, well braced. Then stretch the fence—stretch it till it sings. Ellwood fence will stand any stretching. You cannot break it.

Erect your fence in this way and it will last twice as long. Any fence dealer can supply the tools. *It costs no more to erect a fence properly.* It requires no greater effort if you expend a little thought to get the knack of doing it. Our dealer nearest you will give you a booklet explaining how to erect a fence—how to make the work easy and right.

The steel in Ellwood fence is specially made for the purpose from carefully selected stock. It is hard, elastic, tough and springy. The line wires, composed of two or more wires twisted into cables, give each individual wire the shape of an elongated coiled spring. The fence is therefore sufficiently elastic to take care of expansion and contraction, and yet so rigid when properly stretched as to prevent sagging. The small and permanent mesh is made by weaving one continuous wire throughout the fabric. The mesh or stay wires are so interwoven that slipping is impossible. The triangular truss is the strongest form of construction known. For this reason, Ellwood fence will stand the hardest usage and still retain its shape.

Ellwood Fence is sold in your town. Look for the Ellwood dealer and let him show you his different styles of fence and quote you his low prices. Get his expert advice on your special needs. He is on the spot, buys in large quantities, gets the lowest carload freight rates, demonstrates quality before your eyes and is the man from whom you will get the most for your money.

THE NEW CALIFORNIA

THE BIG BONANZA GRAIN RANCHES IN

GLENN AND COLUSA COUNTIES

In the Heart of the Rich and Bountiful

Sacramento Valley

Now being sub-divided and irrigated. You cannot do better than buy an ***Irrigated Farm*** there.

BECAUSE

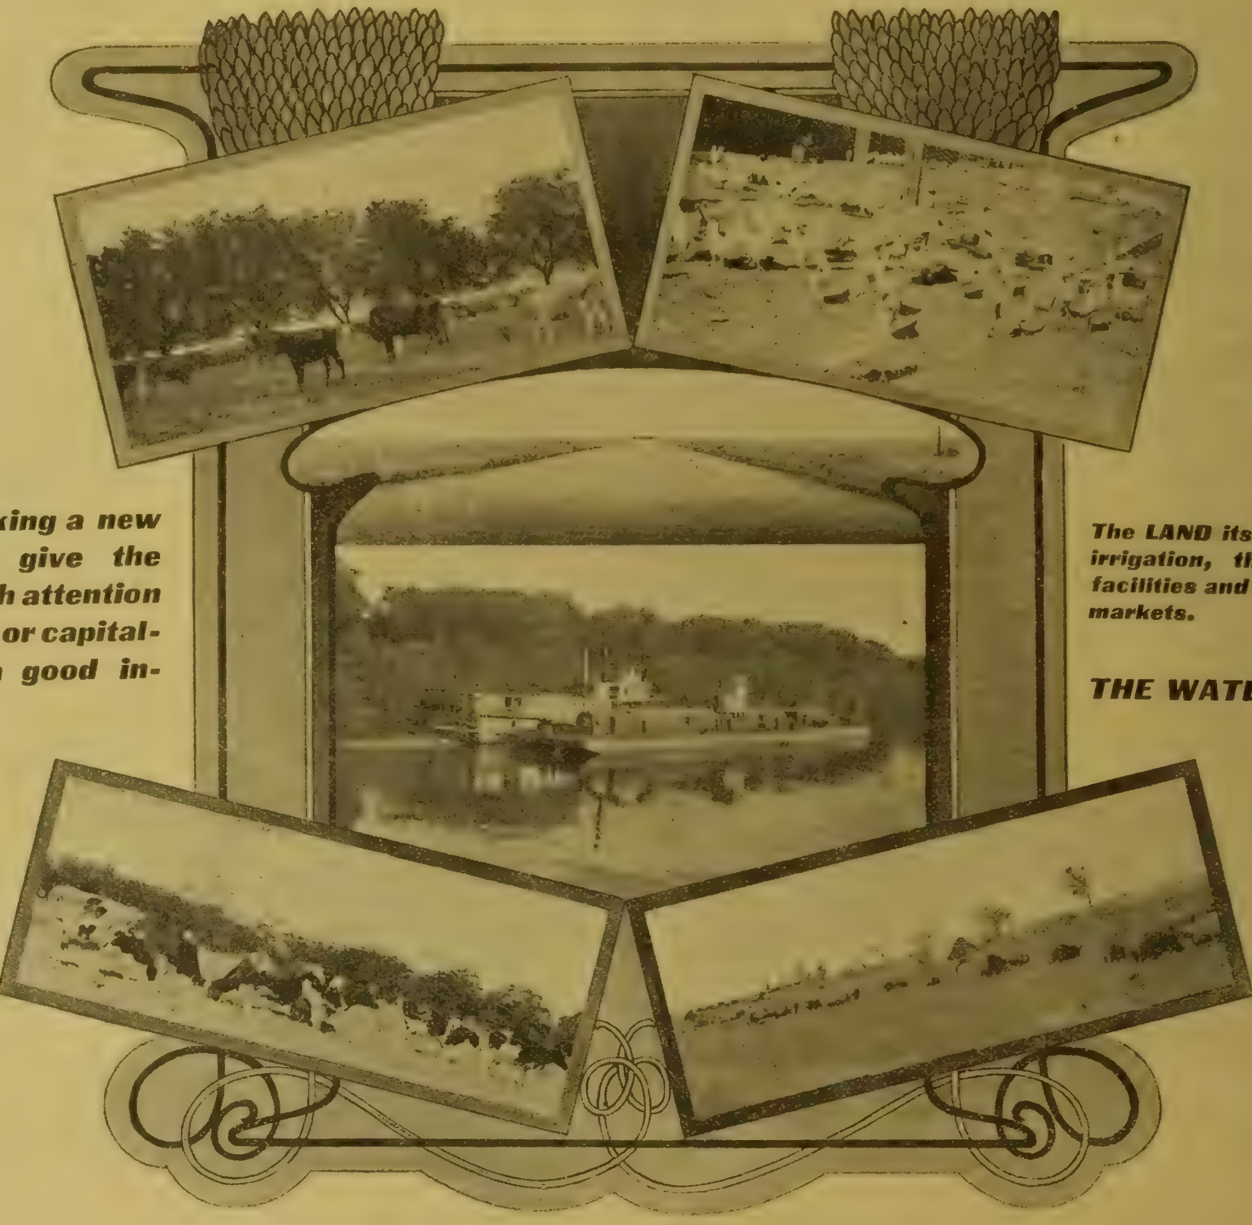
Intelligently handled it is truly the best investment.

Your money is both safely invested and under your own control

A farmer seeking a new home should give the matter as much attention as the banker or capitalist seeking a good investment.

$125.00 PER ACRE

$15.00 per acre down, the balance in ten annual installments.



There are six essential features that should be first investigated:

1
The **ORGANIZATION** behind the project

2
The LAND itself, its fitness for irrigation, the transportation facilities and proximity to large markets.

3
THE WATER SUPPLY.

4
The **Canal** and **Lateral system**, its permanency and adequacy.

5
The **Drainage System.**

6
The **Climate,** growing period and general conditions.

We invite the most careful investigation. Come and let us show you how fully we meet every requirement

Rich as the Valley of the Nile

A Section of Orchard and Field Crops, Dairying, General Live Stock and Poultry

Time was when the Sacramento Valley was dubbed the Granary of the West. Its great productions were chronicled and the methods of harvesting and other field operations were on such a gigantic scale as to throw about it a halo, and it has been written of and illustrated because of the princely magnitude of its farming. The fall was coming, however, during all this glory because the continuous cropping to one cereal without rotation led to inevitable decrease in production, and ultimately many acres were allowed to lie idle for years. Meantime the other sections of the state had felt the impetus and received the benefits coming from the more intensive fruit culture, and occasional favored spots where the great landholders would release some of their holdings in the Sacramento Valley showed most progressive communities. The greater wealth brought to the owners by this more intensive cultivation has gradually led to the extension of fruit farms. This necessitated cutting up all the big ranches, the bringing in of new blood, and in many cases the construction of canals for carrying water to the lands.

PEACHES ON THE RANCH OF W. F. BURT.

The holding of these great ranches by one man or one corporation has to a certain extent been to the detriment of this great valley. This is being more and more realized, and especially is capital beginning to see the great possibilities of these rich lands when water is put upon them. General Chipman in his address at the State Fruit Growers Association at Stockton made emphatic the gain in population shown by the last census brought about in counties where irrigation has been developed to its greatest. Some counties have shown an actual decline in population. Of course it must be admitted that these are the mining counties, but others, large at one time in the agriculture of the state, have stood almost without increase. As an example of decreasing population, we may cite Alpine, a mining county, losing almost half of its population during the last ten years. Amador, a mining county, decreased from 11,000 to 9,000. Del Norte showed an increase of only nine people in the ten years. Eldorado, another mining county, showed a decrease from 8986 to 7492. It is to be hoped, however, that the fruit growing interests which are beginning to predominate in that county, will bring it back to its former prosperity, for horticulture brings permanent prosperity while that from mining is only temporary.

To come down into the Sacramento Valley proper, Glenn county in 1900 showed a population of 3150; in 1910, 7171. Colusa, its next door neighbor, did not show so large an increase, having 7365 in 1900 and 7732 in 1910. We think it is safe to say that far greater irrigation extension was made in Glenn than in Colusa. We call attention to these two counties in particular for the sake of making a bit of prophecy. We are going to assume the truth of General Chipman's conclusion that population and production follow irrigation, and prophesy for these counties a doubling of population during the next decade—this largely because of one great system of irrigation. Ten years ago great stretches of land in these counties were held in grain ranches. The great Glenn Ranch, largely in Glenn county, alone being held by one man. This ranch, together with other thousands of acres, has been purchased by eastern capitalists, generally known as the Pittsburg Syndicate, and these people have carried the waters of the Sacramento river for many miles and distributed them over these two counties. 125,000 acres are being covered and the concrete headgates and other methods of distribution of the water are so permanently established that one of the best irrigating systems in the state of California is the result.

These lands extend from the banks of the Sacramento river on the east well up to the Coast Range on the west and from several miles north of Willows to a point south of Williams. Almost every variety of soil from a heavy black adobe to sandy loam of the foothills may be had.

One point which makes these lands very attractive to the homemaker is that they offer a good investment. The price at which acreage is held, $125, including water right, cannot help but impress upon one who has noted the improvements which have come with irrigation the fact that they will in the future show great increase in real valuation. We believe this is a wise move on the part of these great colonies. Too many times in the history of development propositions have the founders put prices upon the lands which have yielded to them practically all of the profits for years to come. The better class lands in the Sacramento Valley covered with water at $125 per acre certainly look good to the real homemaker. It is a great satisfaction to have a home place which is not only affording an annual income for the support of the family, and being increased in value by improvements, but which also makes the owner feel that it is a savings bank returning better than a four per cent interest by this real increase in valuation.

INTENSIVE SACRAMENTO VALLEY FARMING.

As we remarked before, there has been much complaint because of the selfishness of the holders of these great ranches in keeping them intact and refusing the small farmer an opportunity in the valley. Now this great syndicate is throwing open thousands of acres, as are other companies in the Sacramento Valley. Development now is up to the home maker. Speculation here may look attractive, but the speculator who buys to hold until the actual home maker offers a higher price is not the man desired on those lands.

Returning again to a general consideration of the valley, let us refer to the fact that if the states of Maine, New Jersey, and Connecticut were taken up and bodily laid down in the Sacramento Valley, there would still be a few nooks and corners for potato patches. We make this comparison, for in speaking of the hundreds of square miles of wheat still in existence, the idea might obtain with those who are unacquainted with the valley that it is practically all grain land with but little attention given to fruits. But with these great grain fields there are many fruit producing sections. As evidence of this let us mention that the annual output of the valley in fresh deciduous fruits mounts well up towards $7.500.000. In citrus fruits we cannot give exact figures as to financial returns, but in Butte county on the eastern edge of the valley more than 400 cars of the very finest oranges have been shipped to eastern markets this year. Butte county is also boasting that she will soon be the greatest olive producing section in the world. In dried fruits the production is also great. Many canneries run full handed in season. Almonds are also one of the profit bringers in the central part of the valley.

Dairy products bring millions to the valley and in this we believe the lands described in Glenn and Colusa counties will excel. The quantity of water being brought to the lands, together with the peculiar adaptability of the soil, will make alfalfa supreme. One farm northeast of Willows has just been made ready for irrigation of alfalfa. Every one of the 160 acres was diked and ready for the seed a few months ago when the writer had the pleasure of a ride over the great ranch. We may refer to that event because of the bearing it has upon the photographs shown upon this page. These photographs were all taken upon one small ranch of only seven acres, but it has the distinction of having won the prize of one of the finest registered Holstein cows to be secured in the East. This is one evidence of the liberal management of the great concern which has had to do with developing these lands. The owner of this place is Mr. W. F. Burt, and regarding it we may be pardoned for referring to a bit of information which we gave at the time of the winning of the prize: "This place is directly under the levees of the Sacramento and on exceedingly fine, rich land. It is a good sample of intensive farming accomplished by the farmer's own labor and that of his family. Besides a living for his family Mr. Burt has banked over $1700 during the past year. Cows and pigs, fruit trees, garden truck, small fruits, poultry and even several stands of bees in a stray corner, indicate that Mr. Burt makes the most of every item on the ranch. Besides the place is well kept and neat."

GRAPES ON BURT'S PRIZE WINNING RANCH.

The prize which was offered by the Sacramento Valley Irrigation Company was secured by this ranch because of the intensive cultivation which Mr. Burt had given and the general care of the place.

Ring in the New

Next Sunday will mark another milestone in the lives of all of us. The new year will be born, and the old, with its successes and mistakes, will be history. A casting over the past and resolutions for the future will be in order. The past need take but little of our time, the future more. The "new year resolution" is the butt of many a joke; it is broken so often as to even be considered obsolete. But there is that in such a day which invites retrospection, and the latent resolution to do better is liable to receive new life. Encourage it.

In agricultural matters, as in intellectual and spiritual life, there is an infinity of possibility. The stone wall with its "No farther" will never be encountered. The new year offers a fresh start to each. Will our farm or orchard prove more profitable or less so than last year? Weather conditions and market conditions may combine and defeat in a measure our best plans, but let us so conduct our affairs that so far as our effort is concerned conditions will be right for success.

May that success be complete for every one of the Cultivator readers, and may hapiness be granted every day of the new year.

Bumper Orange Crop

A regular annual feature, and a most valuable one, of the Riverside Daily Press is its annual estimate of the orange crop. The estimate is carefully made and given by districts in the state. After giving this estimate the Press concludes as to this year's output: "This crop should bring the orange and lemon growers of California eighteen or twenty million dollars."

This estimate gives to the Riverside district 4,650 cars. Redlands comes second with 4,600. Pomona is third with 4,000, and so on, with valuable figures as to the various other citrus-producing districts of Southern California. The estimate for Tulare county is 2,380 cars. This is hardly an estimate, because practically that number of oranges have already been shipped and the crop cleaned up. In Butte county the situation is similar, with a total of 400 cars. The Sacramento-Placer district shows 150 cars. The grand total for the state is 37,380 cars of oranges.

In lemons, San Diego county leads with 1,250 cars. Other districts bring up the total for the present year to 6,800 carloads.

This will make by long odds the greatest citrus output the state has ever had, and with the quality fully equal to if not finer than any former season, the outlook is good for great returns.

The Hawaiian Islands are making experiments in the growing of cotton as a rotating crop with sugar cane; also in growing it in sections of insufficient water. It seems that the long-fibered Sea Island and Caravonica cottons are grown and as perennials. The plants are widely spaced and vigorously pruned every year. The prunings of the more desirable plants are then used for starting other plants, for budding or grafting. In this way the increase is rapid, the more desirable plants are grown and quick results secured. Besides the season can be controlled so as to meet the labor situation more satisfactorily. It is not yet known how long cotton can be profitably grown as a perennial.

Farm Papers in Schools

Instructor Morgan who has charge of the agricultural work in the Stockton High School, is one of the most enthusiastic believers in agricultural teaching in the state. Mr. Morgan began his work in the Imperial High School and made a record there which called attention to his abilities and Stockton began its agricultural department under his leadership. As yet the Stockton schools do not have a farm for permanent agricultural experimentation, as does Los Angeles, Oxnard and some others, but it is expected that this will be secured in the near future. One feature of the work in the Stockton schools is that the agricultural department is supplied with a reading table on which are copies of all the agricultural papers of the Coast. Mr. Morgan informs us that these papers receive a great deal of attention even on the part of students living in the city and not directly interested in farm life. In a sense these papers bring the young people closer to the soil than do the text books which they are studying.

Work of particular interest to be taken up after the holiday vacation will have to do with horticulture and viticulture. Varieties best suited to valley conditions, especially those immediately surrounding Stockton, methods of growing these varieties by propagation, budding, grafting and cuttings will be taught, not only taught, but the students will be expected to do the work under competent instructors.

Cereal Production

The United States total production of corn in 1910 was 3,125,713,000 bushels. This is far greater than that of 1909 which was 2,772,376,000, but the price this year is almost ten cents per bushel lower than last year, or an average the country over of 48.8 cents, which will bring to the farmers something over $100,000,000 less than last year. The wheat production on the other hand was lower this year than last, being 695,443,000 as against 737,189,000 bushels. The price like that of corn is about ten cents per bushel lower than last year. Barley shows a slightly decreased production, being 162,227,000 bushels this year as against 170,284,000 last year, but the price is two cents per bushel higher.

It may be of interest to add that the value of certain crops of cereals, potatoes, hay and tobacco aggregated on December 1st, 1910, $3,735,464,000 as against $3,971,426,000 preceding year same date, making the financial returns slightly less this year, brought about by prices averaging 8.5 per cent lower than last year.

Conserve our Forests

We imagine it is a little early to remind irrigators, lumber people and others interested in the conservation of watersheds and timber of California of the fearful losses which occurred last summer through forest fires. This is presumed to be the rainy season, hence there is little or no danger from these fires. In the minds of many, the proper time to discuss methods of prevention of forest fires is when the trees are burning. The evidence of loss is then before our eyes and its consideration is forced upon us, but unfortunately like the Irishman's roof, it is then impossible to make repairs. If the situation were given attention at this time of the year, there is more probability of accomplishing results than by summer discussion. As a slight reminder, let us mention that one fire in the forests of Montana, Northern Idaho and Eastern Oregon last summer destroyed over 6,000,000 board feet. The area burned was over one and one-quarter million acres. In one comparatively small section near Coeur d'Alene, Idaho, 450,000 acres were burned over. Other sections, many of them included in national forests, suffered proportionate losses. Such disasters should give impulse to methods of prevention which we feel are fully as important to the national welfare as is the national defense on which millions of money is spent.

Wool Growers Protection

The wool growers who will convene in Portland on January 4th say that they propose to prevent if possible the next Congress making a "jig-saw puzzle out of Schedule K of the tariff law." On this point the call for the convention states:

"How to prevent ruinous tinkering is the subject of greatest interest to the wool growers who will attend the convention. They believe the producer has always had the worst of it because manufacturers of woolens have great wealth and influence, while the growers have always faced a long-continued effort to cut down their share of the profits of the business. Some concerted action will probably be taken at the coming convention to prevent, if possible, the disturbance of the wool tariff to a ruinous extent."

Congratulations are due Florida for the organization of its Citrus Exchange. We note that it is already taking the advance steps of advertising Florida fruits in the eastern fruit trade papers. The advertisements are large and attractively gotten up, giving names of various dealers who can supply the fruit of the Florida Citrus Exchange. The word "Florida" appears in very large black letters and through the center of the word runs a mortise carrying the words "Citrus Exchange." Underneath is printed, "You'll want more." The exchange in California has been the life of the citrus industry. The Florida offspring has fair promise of being equally as successful.

The fight for parcels post is, if anything, waxing hotter and its opponents are more than ever shouting over the fact that the department is at present a losing proposition and urging that extension of business will only result in greater loss. If this be true, it is time for a change in the management of the postoffice. It is a strange situation when politicians will use their own inefficiency as an argument for continuation of poor service. Parcels post is coming, but the old order of things dies hard.

The Dry Farming Congress Bulletin for December is issued in book form containing 288 pages. It has list of the officers of the International Dry Farming Congress for 1911, together with constitutions and almost the entire proceedings of the Dry Farming Congress held at Spokane last October. This is sent to all members of the association or may be purchased of John T. Burns, Secretary, Colorado Springs.

A selling agency for the apple industry of the Northwest is being proposed by the president of the Oregon State Horticultural Society. It is proposed to form a company of sufficient capital to handle all the apples of Oregon, Washington and Idaho.

Agricultural News Notes of the Pacific Coast

Northern California

A colony project is under way at Marceuse, Sutter county.

Chico farmers are petitioning for summer vacation of schools to be extended.

Fifteen thousand acres of the famous Bidwell ranch, near Chico, is being subdivided.

An apple expert from Washington has predicted a great future for apple lands of Butte county.

Water rights and a reservoir site have been secured to cover 65,000 acres of land near Corning.

Chinamen along the river in Sutter county have combined and are holding beans for higher prices.

Seventeen hundred acres of the Hagrin ranch, near Sacramento, is being subdivided for truck farming.

Sacramento county reports 60,000 young bearing orange trees, principally located at Orangevale and Fairoaks.

The exhibits of fruit made by Chico at the National Horticultural Congress secured five first and two second prizes.

A body of about 400 acres of land near Corning has been purchased and will be used to grow garden truck for northern trade.

A forty-acre tract has been donated by a resident of Montague, Siskiyou county, to the University of California for a demonstration farm.

The High School of Corning is gathering together an agricultural library, which will be circulated amongst the farmers of the neighborhood.

The finest lot of beef cattle ever shipped from Yolo county is reported to have gone out last week, when eighty-six Shorthorn steers were sent to Oakland.

A number of taxpayers of a drainage district near Gridley have petitioned the board of supervisors to construct a system of lateral drainage canals.

A eucalyptus planting concern of Solano county, which is being managed by a promoter who is reported as drawing $24,000 a year salary, is being investigated.

Humboldt county creameries paid on first of the month's delivery as follows: Capital, 40 cents; Central, 40½ cents; Libby, McNeil & Libby, 39¼ cents; Grizzly Bluff, 39¾ cents; Swift & Co., 39¾ cents.

The Butte County Citrus Association is gathering an exhibit of citrus fruits and of olives for an exhibit at the citrus fair in Sacramento in February, at the time of the meeting of the Western Fruit Jobbers' Association.

Hop growers of Sonoma county are selling rapidly at about 14 cents. It is reported that over 5,000 bales have changed hands in the state within the past few days. Less than 8,000 bales remain in growers' hands.

Members of the Live Oak Almond Growers' Association, Yuba City, Sutter county, recently met and elected officers for the coming year: A. E. Boynton, president; J. D. Spilman, vice-president; John Alexander, secretary; A. W. Cutts, delegate to the State Exchange.

Central California

Lodi, San Joaquin county, is still gathering red raspberries.

Interest in California prunes is increasing and the market is very firm.

A good roads association has been organized by Tulare county good roads boosters.

The outlook for Valencias was never better than at present in Tulare county.

Orange shipments made from Tulare county are bringing better returns than those of last year.

Lemoore dairies are being given a thorough cleaning under the direction of state dairy inspectors.

The Fresno Canal and Irrigation Company is building a wasteway from the Herndon canal to the San Joaquin river.

A Japanese potato grower in San Joaquin county is reported to have cleared over $200,000 on his this year's crop.

Pajaro Valley's rain last week aggregated about a fourth of an inch, which makes the total for the season 3.26 inches.

The Tulare County Humane Society is reported to be on the trail of those who follow the practice of picking live turkeys.

Over 500,000 head of cattle are being fattened on sugar beet pulp in the Alisal section, near the Spreckels sugar factory.

Cattle men of the valley are looking for range for their stock, which has been greatly restricted by the continued drouth.

A largely attended meeting was held last week at Newman, Stanislaus county, to discuss the formation of an irrigation district.

The Tulare Co-operative Creamery Company has made arrangements for enlarging its factory so as to handle evaporated dairy products.

The district or county fair plan to receive aid from the state has been endorsed by many fair associations of the San Joaquin Valley.

Porterville orange growers sold their holiday fruit so close that the local market was short of fruit and imported oranges from the southern part of the state.

It is reported that 350,000 sacks of potatoes will cover all the stocks now in this state, which necessitates importation of potatoes from the East before the next crop can be marketed.

San Joaquin county potato growers are pleased with present prices, which are the highest of the season. It is stated that California uses 12,000 sacks of potatoes every day in the year.

A company has been formed at Turlock, Stanislaus county, for the purpose of raising and shipping cantaloupes during the coming season. It is estimated that several hundred acres will be planted.

A car of late Emperors from Dinuba recently sold in New York city for $2,540. The prices at the closing of the season have proven much more satisfactory than the earlier shipments.

Southern California

Beet seed planting has begun in Norwalk, Los Angeles county.

One ranch company at San Jacinto has just finished seeding 4,000 acres of grain.

A Riverside rancher claims $10 from each of his tomato vines during the past season.

Over a half million in disbursements are to be made in Imperial valley from cotton sales of the season.

Southern California has forwarded the greatest amount of oranges ever sent out to the holiday trade.

The California Vegetable Union packing house at Olive is being moved to Placentia, Orange county.

Nearly a thousand head of cattle were received in one day recently at the Chino Sugar Factory for fattening on beet pulp.

Experts in agriculture in Japan are in Imperial Valley, learning up-to-date methods in irrigation and general agricultural practice.

County Horticultural Commissioner Bishop of Orange county is inaugurating a campaign against mealy bug in Los Angeles county.

Articles of incorporation of the Holly Sugar Company have been filed with the county clerk of Orange county, with capital stock of $5,500,000.

Highland, San Bernardino county, reports an average of fourteen cars of oranges daily for December, which is the highest ever for that month.

A 3,000-acre ranch near Tehachapi, a liberal portion of which is good alfalfa land, has been secured by dairymen, who will establish one of the largest dairies in Southern California.

Orange-packing houses at Redlands are using machines for the rounding of edges of orange packing boxes, so as to lessen the danger of injury when the box is put under the press.

The Hermosa Water Company supplying water to lands about Cucamonga, has decided to extend its tunnel in Deer Creek canyon and secure more water is possible.

Citrus growers in San Fernando Valley have installed automatic thermometers which in case of possible frost sound the alarm at the central telephone station when the operator gives alarm to the growers.

Irrigators in the Antelope Valley are concerned over the effort of the city of Pasadena to secure the waters of Big Rock Creek and they promise a strenuous fight before these waters are allowed to be taken from the valley.

Potato growers at San Bernardino have been troubled this year with a moth which lays eggs on potatoes which may be exposed on the surface of the ground. On the hatching of the egg the small worm eats its way into the potato.

Riverside citrus growers are endeavoring to secure more liberal appropriation for the citrus experiment station and hope the legislature will appropriate enough to purchase the lands which the state is now leasing for station grounds.

The Coast

Blackleg is killing many range cattle at Wastuchna, Washington.

Spokane reports half of the year's output of wheat still held by the growers.

Winter wheat in Eastern Washington is reported to be in the very best of condition.

Spokane reports the present season's supply of hops to be practically all out of the growers' hands.

Contract has been let for Colorado river protection work in the form of levees below Yuma, Arizona.

Seattle, Washington, markets report shortage of first-class apples, which are ruling remarkably high.

Land supposed to be private holdings near Walla Walla, Washington, has been filed on by squatters.

Irrigation plants have been installed at Beverly, Washington, which will lift water for 1,400 acres of land.

Spokane fruit growers are discussing a movement to secure free trade on American-produced fruits to Canada.

Reports from several Coast sections indicate that Christmas turkeys sold decidedly lower than at Thanksgiving.

The cattle industry of Pima county, Arizona, brought to that county approximately $700,000 during the past year.

With the constitutional campaign on, Arizona has organized a Statehood League to take up the fight for securing its adoption.

The Grange Patrons of Husbandry, at Oregon City, Oregon, has constructed a large barn and warehouse to be used in common.

The widespread attention attracted to the apple in Eastern Washington and Idaho will result in great extension of apple planting the coming season.

The Washington State College at Pullman has scheduled two new features for the winter short course, one being in domestic science, the other in forestry.

Cleaning and polishing of rice has become a great industry in the Hawaiian Islands, having increased from $600,000 in 1899 to over $2,000,000 in 1909.

The National Apple Congress of Denver has elected officers for the coming year. A. L. Prince, New Mexico, is president. The secretary is Clinton Oliver, Paonia.

Work on the siphon under the Colorado river above Yuma is progressing satisfactorily. This is constructed to carry water underneath the river for irrigation on the Arizona side.

President Taft has signed proclamations eliminating from the national forests of California, Colorado and Wyoming 246,000 acres of land, which will later be opened to entry.

British Columbia farmers made up a delegation filling a special train costing over $75,000, and went to Ottawa to insist that free trade with the United States on agricultural products be granted to them, and that free trade on agricultural implements from the United States be another feature. The request was refused.

Coulson's
EGG FOOD

If you were going to erect a large building, you would consult an architect—if you wanted some legal papers drawn up, you would go to a lawyer—because these men have made a special study of their respective professions.

The same principle applies to the feeding of your chickens. Presumably you have not the machinery or formula for making an egg food so that it will be just what your hens need.

That's why you should buy COULSON'S EGG FOOD. It is the result of years of study—it is scientifically mixed by experts with the right proportions of the various ingredients to give a balanced ration.

COULSON'S EGG FOOD means a healthy stock, with great laying powers and eggs of quality. Saves you the time of mixing—provides a better feed—makes more eggs—means more profit, as COULSON'S EGG FOOD more than pays for itself, through making hens lay to their full capacity.

It is especially advantageous to use it at the present time, when the price of eggs is beginning to increase, and when also you are anxious to have your hens in good condition for the molting season.

Hens eat only what they like, but there are many foods they must have, and which must be mixed with their regular food so that they get the desired quantity. The only way the food can be mixed is by improved machinery—that's why you should feed COULSON'S EGG FOOD.

Get it at your dealer's; anyway send for our Catalog which tells about the famous Coulson products and gives valuable information about Poultry Raising.

Coulson Poultry & Stock Food Co., Petaluma
Germain Seed & Plant Co.,
Distributing Agents for California

We have secured the California agency of the

Prairie State Incubators

The best—bar none. Car will arrive about January 1st. Come in and see them, or send for Prairie State Catalog. We also have a carload of the

Baby Buckeyes
50-Egg Incubator for $7.00

Did you ever hear the like? And with this guarantee, too: "Purchaser can operate it for forty days, and if it does not meet with his entire approval, it may be returned to us and the price paid will be promptly refunded."

Carload of these will soon arrive. They will go like hot cakes. If you cannot come in, send for a Buckeye Catalog. "Anybody can hatch chicks with a Buckeye."

When writing to advertisers mention the Cultivator

Practical Poultry Culture

A LIVING FROM A SMALL PLANT.

It is always interesting to read about how the "small poultryman" succeeds, and especially at the present time when intensified poultry culture is commanding so much attention. It is profitable to investigate these miniature poultry farms. After all, the size of a poultry farm is measured by its capacity and not by its acreage.

The question of making a living is uppermost in the minds of those who are contemplating engaging in the work. When a limited capital is brought into play it resolves itself down to one important factor—personal labor. Where a poultry plant is to be conducted on a restricted plot of ground, and where the fowls do not have a large range of land, substitutes of all kinds must be brought into action so that, practically, the stock are having the same benefits as derived on large territory.

The writer has come across one of these small places which not only is a model but which has proved that it is possible for a man to make a living on a small tract of land.

John E. Gerhart was for a number of years a cigar merchant in the city of Philadelphia. The close confinement which his work compelled did not agree with his health nor happiness. He longed for country life. When a boy he lived on his father's farm and always took a great interest in the "chickens," but after he grew up and drifted into the city, the question of "chickens" could materialize only in dreams. The back lot of a city home does not, as a rule, afford sufficient space to keep even a few hens. So as the city life and close business confinement began to work on his nerves, it was but natural that Mr. Gerhart should long for green fields and "chickens." Three years ago he came to Hammonton. He looked up the poultry situation. He read and studied the best works on the subject. He soon realized the fact that the present day poultry methods were far different from the old-time "chicken" logic, and that he had to begin all over again. He purchased a property which contained a little over an acre of ground, and on which was erected a poultry house 14x125 feet. In this building he fitted out nine pens, besides a feed room, workshop and storage rooms, thus having everything under one roof. In each of the pens he keeps from 40 to 50 head of fowls. The White Wyandotte and the Single Comb White Leghorn breeds are kept.

Mr. Gerhart is constantly among his poultry, carefully attending to their wants, and leaving nothing undone that might give them comfort. Of all the farms and flocks of poultry the writer ever visited, there are none where the fowls are more tame. They even have no fear of a stranger, and while the writer and Mr. Gerhart were in the yards the hens would congregate nearby and look up into the speaker's face as though understanding every word spoken. Occasionally an individual fowl would be commented upon, and Mr. G. would reach down and pick it up as if it was unable to get away. To get these hens so tame of course took some time and patience, but it has paid. A carefully kept account showed that there was a clear profit of $2 per head average for the entire lot of hens. This, Mr. Gerhart says, is largely due to keeping the stock in a contented frame of mind. When a hen "feels at home" has nothing to scare her, and knows that no harm can come, her energies and food are bound to divert to the production of eggs. Even the Leghorns on this place are so tame that a stranger can pick them up.

Mr. Gerhart is a good feeder. He buys the best of grains, and he watches the appetites of his flocks, and furnishes them according to their wants. "It takes a little time," he said, "but they never in that way become overfed." Asked what it cost to fed his flocks a year, he replied that his White Wyandottes cost him a half cent a day, or $1.80 per year, each, and his Leghorns are kept for about 20 per cent less. He said the Wyandottes laid about the same number of eggs in a year as did the Leghorns, but the latter were more steady in production than the former, stopping only for the annual moult. During the winter—counting from November 1st to June 1st—the Wyandottes' record was about 50 per cent, while that of the Leghorns, for the same period, runs from 50 to 70 per cent, according to the age of the flocks.

Mr. Gerhart explained that his present plant gave him an income, over all expenses, of about $50 per month, but that in another season he hoped to greatly increase the amount. He is now arranging for a large brooding house in which broilers will be raised, and this he believes will mean a substantial increase in profits. At present he relies on sales of table eggs to private custom, and the disposal of a limited number of broilers. His present facilities are not ample to make broiler raising much of an object, and for that reason the new brooding house is planned.

Mr. Gerhart is a great believer in sprouted oats. He remarked: "If I could not have sprouted oats, or a substitute equally as good, I would go out of the poultry business." In his cellar he has piles of boxes in which oats are being constantly sprouted.

The object lessons learned on this farm are:

First—Cleanliness; everything being kept as neat as it is possible to have a house.

Second—Regularity; the fowls are fed at regular hours, nothing being allowed to interfere.

Third—Tameness of stock; making the fowls feel that there are no enemies.

Fourth—Convenience; having everything so arranged as to save time and labor.

Fifth—The trade; it being mostly retail, securing the best prices.

Sixth—Early pullets; getting them out in time to develop and get to laying at the time the hens are going into the moult.

Seventh—Young stock; relying on early-hatched pullets and yearling hens; after the second year all hens go to market.

Eighth—Trap nests; using them so he may know his best layers and each year breed from only such, and also to know how to find out the drones. No idlers are allowed; in fact, Mr. Gerhart cannot afford to keep them.

60,000 "Queens" in the Contest

all along the line last year, and the Queen never fell behind. Friends, you will be interested in knowing about the uniform big hatches produced by the

Queen

It is the dependable hatcher under *all* conditions, in *everybody's* hands.

Let's get in touch with each other. Get my book to-day! I start people in poultry on the make-good basis. I'll set a Queen down at your station, freight prepaid, and give you the chance to test it any reasonable length of time. Test it 60, 90 or more days, till you are satisfied. 10 year straight guarantee now.

Send your name for my great Poultry Guide. Request on a postal brings it. Tells the truth about Queens—contains reports and pictures from the 61,000 who are making money. Sound poultry advice and rules. Get the book FREE. Address

The Arenberg Brooder Stove

Proven to be the most successful Brooder Stove on the market. Awarded gold medal for most Meritorious California invention at California State Fair, Sacramento, September, 1910. Burns distillate, perfectly simple and easy to manage. Write for details. H. F. ARENBERG, Petaluma, Cal

His space is limited and every hen must be relied upon.

Ninth—Exercise! the hens being kept busy. Each pen is large so that there is ample room for them to scratch and take exercise. The floors are heavily littered with cut straw and cut corn stalks, and among this the grain is strewn. They are compelled to work.

Thus, in short, we have the testimony that there is profit in a small farm, and there is every reason to believe that with the additions that Mr. Gerhart is about making to his present plant, the income in the future will be doubled.—American Poultry Advocate.

PROPER FEEDING NECESSARY FOR EGG PRODUCTION.

Proper feeding is one of the most important factors in egg production, says an experienced poultryman. The pullets may be just starting to lay and the year-old hens ought to be in laying condition, but both will be laying better a month from now, and neither will be laying anything like their full quota of eggs unless the feeder and caretaker sees to it that their rations are such that they can make eggs out of it, and that they should be permited to turn all their energies to producing eggs instead of being compelled to fight the lice and the weather elements. Fowls cannot produce many eggs on corn alone. Eggs are made of other elements besides those that corn furnishes. Why is it that your neighbor's half-dozen of "hit-or-miss" hens lay so well when they are fed only on table scraps? It is because table scraps contain nearly all the elements for egg production (except grit). You never had a flock of hens that were so lazy and shiftless that they did not lay well duringg the spring months. In fact, almost any hen, unless she is suffering from injury or chronic ailment, will lay during the spring or early summer, without regard to breed or ancestry.

We know that some hens have an inherent characteristic to lay better than others of the same breed and under the same or similar conditions; but we believe that when hens are not laying it is not their fault, but the neglect of the owner. Of course, during the moulting season the hen is not expected to lay, but if she has been a laying hen when the price of eggs was high, then she has earned a much-needed rest.

It is now time that hens should be started to lay, and meat and green foods are the best things we know of to get hens ready to lay. So many would-be poultrymen have an idea that grain is the natural food for poultry, and think that when they have scattered a sufficient quantity of grain in the litter, they have exercised good judgment in feeding, and the hens in turn should shell out the eggs. We have had flocks of exceptionally good layers lay well on a grain diet, but we have placed these hens before a ration of meat and green food together with the grains, and have increased the output of eggs considerably. We believe that meat, or animal food in general, and green food are the keynote to the production of the greatest number of eggs, when the animal food is fed in sufficient proportions. There is no animal on the farm that when allowed free range seeks as much animal food as does the hen. She must have plenty of animal food and when she gets a sufficiency she fills the egg basket. She obtains the bugs, worms and insects in the summer time and that is when she is the heavy layer. Furnish the ideal summer conditions as to feeding and housing in the winter time and summer's quota of eggs will necessarily follow.

A large amount of grain is wasted because it does not permit the hen to make eggs out of it. The elements that are necessary for eggs are not there. A plain ration of grain that is not producing results can be made into a profitable one by the addition of a proper amount of grain food and meat. Green cut bone will not make a hen lay two eggs a day, but it may make her lay two eggs where she had laid one before. Try it in the mash in the morning. The butcher always has plenty of refuse that is wasted. With a little exertion and friendly terms with the butcher this can be obtained for the hens. The hens will return a large profit for the extra exertion and perhaps the butcher will be glad to buy the eggs at an advanced price for his high-class customers.

As for vegetables, where can they be raised cheaper than on the farm A little work in the spring in preparing the land and sowing the seed and a little act of cultivation when weeds are flourishing will give enough for an exceptionally large flock of poultry on the average farm.

The amount of vegetables that are needed for a flock of one hundred hens on a farm may not be worth very much in dollars and cents, but when turned into eggs the value is increased nearly one hundred fold. Cabbage and mangels make two of the cheapest foods and may be fed either cooked or raw. Cut clover is an excellent green food. When steamed it seems to get much of its freshness when green and the hens certainly relish it. I believe there is no other one green food that contains as many different elements, as does alfalfa or clover. It is very poor economy to attempt to get good results without the aid of all these valuable foods. The amount of such foods to be given depends much on the nature of the flock and their individual characteristics. It must be determined largely by the experience and exercise of good judgment of the feeder.—Coleman's Rural.

POULTRY POINTERS.

Fight lice.

Raise chickens.

Give fowls and chicks plenty of fresh water.

Have regular hours to feed the fowls.

Poor hatches are caused outside the eggs as many times as in them.

Roasters are shipped from four to six months of age.

Meat producing fowls: Asiatics—the Brahmas, Cochins and Langshans.

Charcoal and grit should have a place in every poultry house.

General purpose fowls: American—English and French varieties.

Trap nest your breeders; it is the only way to find out results.

Wheat is cheap at twice the price of corn for a laying feed.

Oats, wheat, bran, and middlings make eggs.

Use commercial creosote for all purposes around the poultry houses.

Damp quarters will cause the fowls to mope and is a good lice-breeding place.

Dryness and sunshine and a dust bath for biddy helps out in the yield of eggs.

Are the fowls getting plenty of grit now? You should see that they are supplied now as much as in the winter.

To purchase eggs is the least ex-

Incubators and Brooders

The evidence is conclusive that the PETALUMA is the best Incubator buy that can be made. The best value for the money ever offered and is appreciated most by those who have had varied experiences with other incubators. Why? Because it hatches such large, strong vigorous chicks. More Petaluma Incubators were installed in the large hatcheries last year than all other makes combined. No other incubator in the world has a hatching record to equal the Petaluma.

Write for our Free Catalogue. It is interesting.

We pay freight.

WINTERS' WHITE INDIAN RUNNERS

The world's greatest egg producers. First, California State Fair, 1909. First, display pen; first, breeding pen; first, drake; first, duck and second, duck, at the Los Angeles show, 1910. Eggs for hatching.

WHITE AND BARRED ROCKS AND WHITE MINORCAS.

Eggs for sale in season.
C. O. WINTERS, 5307 Washington Ave., Los Angeles, Cal.
Phone, Sunset East 1197.

pensive way to get a start in good poultry, but it will take much longer.

Give the growing chicks all the green feed you can, in one form or another.

A single mating of the turkey hen with the tom will fertilize the entire clutch.

Egg producing fowls: Mediterranean—Leghorns, Minorcas, Andalusians and Anconas.

The brooding hen should be respected, and harsh or cruel methods should never be used to break her up.

Green bone is good to promote eggs, but should not be fed too freely, as it is apt to cause more trouble than it would do good.

You should have a workroom, where tools, buckets, baskets, feed and grit may be kept. Have a place for them and keep them in their place.

Chickens hatched and grown to a weight of two pounds are in good demand throughout the spring and summer season at good prices.

There is more chance to make money for the man who aims at utility with fancy than the man who raises "fancy" only.—American Poultry Adv.

QUARRELSOME BIRDS.

Quarrelsome, aggressive birds are a nuisance in the poultry yards. They are a positive detriment to the rest of the flock. If turkeys, geese, ducks, or guineas fail to get along with the rest of the poultry it is best to separate the varieties so that all may thrive. One such quarrelsome bird often succeeds in keeping those he chooses as his enemies from getting enough food to keep them in good health. We once saw a lone guinea in a flock of chickens that was constantly driving the hens from the roosts, the feed troughs, and watering vessels for no apparent reason than that they were afraid of his sharp little beak. What on earth they kept him for we do not know. Unquestionably he knocked the profits off that flock of hens at least one-fourth every season, and he was no earthly good himself, as they had no guinea hens. Old ganders are often dangerous foes to other ganders, chickens, ducks, turkeys, etc. Such birds should be sold unless very valuable. Oftentimes the cutting of a wing or the filing of the bill enough to make it tender will take all the fight out of such a bird. Turkey gobblers are often dangerous foes to children and older people as well. Try the same remedy on them. Old cocks that persist in fighting can be subjected to a filing of beak and spurs and made quite docile. Sometimes hens get bossy and may need to have some of their egotism taken out of them.

There is no use in expecting fowls to give best results where any considerable number are being ill used, whether it is other fowls or human agency that causes the adverse condition to arise. Children should never be allowed to annoy fowls. We know of a family who allow their children to so chase and annoy the hens that they run like quails if they see a child approaching, and the sight of a childish head in the henhouse door is a signal for every hen to get out as soon as she can to protect life and limb. This farmer always says hens don't pay their keep, that they never get any eggs and their hens wouldn't set to do any good. We do not doubt his word at all, though the real cause of the difficulty is easily understood. —Farmers Tribune.

LOOK OUT FOR WEAKLINGS.

At this season of year it pays to keep a sharp eye on your young stock. If there are any dwarfed or rusty specimens, get them out. One will find some that are not sick, but just unthrifty or undersized. They should be culled out and sold or killed. Don't keep them over to use room needed by the better birds. One such little dwarf left in till the breeding season will result in a number of her kind another year. If the runt happens to be a cockerel it is little short of a crime to keep him in a nice flock. Time and again we see one such specimen ranting around among an otherwise fine flock of fowls just because the owner has been too careless to see to his disposal? Weak fowls or crooked backed individuals, and those having wry tails or crooked breasts should be discarded. Those things crop out with surprising frequency in the second generation. Better sacrifice the bird on the table or in the market than risk its leaving its mark on your flock.

Go out among the birds frequently and look them over for the purpose of detecting these defects. They might go unnoticed a whole season if you do not make a special study of the flock. There is another reason besides the looks of the flock for this careful culling. Any deformity shows a lack of normal vigor in the individual, and vigor is a thing we must always work for in these days of artificial methods of poultry culture. Any fowl that has suffered serious illness should go to market as soon as good health is again restored. She may be as good as new as far as the present is concerned, but her constitution is impaired and her vigor will be below par.

A crooked breast or wry tail is usually the result of overcrowding or improper roosting, and does not in any way unfit the bird for table use except as to looks. No city customer wishes to buy a deformed bird for her table, but you who know the cause will not hesitate to use the bird.—Farmers Tribune.

CALIFORNIA vs. WASHINGTON.

A Santa Rosa dispatch in a daily paper claims the superiority of the California hen under the following statement of fact:

Sonoma county will not take a back seat for any district in the egg business. The press dispatch from the North this week telling of the production of 1305 eggs by nine hens for J. G. Cotton of Oklahoma, Wash., in nine months, or an average of 145 eggs a hen, has caused Paul Stoeckle of this city to produce his accounts, which show 1239 eggs from eight hens during the same months, or an average of 155 eggs a hen. Stoeckle purchased his eight hens from a local poultry establishment and had never had any experience with chickens.

RHEUMATISM IN PIGEONS.

Until I kept a flock I never realized the thousand natural shocks a pigeon is heir to. Among the most insidious of these is rheumatism. If they sleep near an open window, or in a draft, it is pretty sure to develop, frequently in the form of wing disease. The elbow joint is the part most affected, probably on account of being the most exposed and liable to become chilled. The main symptom is a lump on the wing and feverishness.

A bird so afflicted should be placed alone in a pen and fed plain food. Pluck the feathers around the affected joint and paint the swelling with tincture of iodine, and it will gradually disappear.—Country Life in America.

A discontented hen seldom is a regular layer. Pay a little more attention to this phase of feeding for eggs this winter and note the success. Don't overdo it and feed an excess, but supply just enough so the hens will look forward to and relish the next feeding. "Variety is the spice of life" and this old adage applies to hendom as well as to the realm of humanity.

Pure breeds will give better returns than the mongrel deadbeats tolerated by our grandparents.

This open front door makes perfect ventilation ☛
Mandy Lee is Miles Ahead
It is the only Incubator without a "Sealed," Air-tight Egg Chamber. It supplies the life-giving oxygen freely, draws off the carbonic acid gas, and is saving the lives of millions of chicks.

READ the story of the Mandy Lee triumph in our new catalog. Other incubators are already preparing to imitate and profit by our great discovery.

No guessing with a Mandy Lee

You cannot afford to buy an old-theory incubator which may go out of date and be discarded next year. You should know the truth *now* about the great discovery. The book is free. Ask for it.

There IS Something New in Incubators
We have taken the boldest and most important step ever taken in incubator building. See the openings into the egg chamber? They mean the saving of chicks' lives. It is the key to *right* hatching. Ventilation in the Mandy Lee is now perfect. It goes on all the time, neither above nor below, but right *at the eggs*. Every minute of the hatch the life-giving oxygen is freely passing in to the eggs and the carbonic-acid gas is passing out. And correct ventilation is just one of the great Mandy Lee features.

We Don't Guess—We Measure
The Mandy Lee is as far in advance of other incubators in heat and moisture as it is in ventilation. We do not guess at anything. The sensitive regulator controls heat to the fraction of a degree and *we measure moisture* just as accurately with the Mandy Lee Hygrometer (one sent with every incubator). You know what you are doing. *You* measure and control moisture; *you* control the hatch. The Mandy Lee is the all-season, all climate, all condition hatcher, always producing the most and the strongest chicks.

Mandy Lee Brooders give direct contact heat to the backs of the chicks. That is *real* mothering, the most important thing in poultry. Hovers are raised and lowered as weather gets warmer or cooler—heated from end to end. Chicks do not pile up and smother. Write to-day for catalog and full information.

ELECTRICAL EQUIPMENT OF GAS ENGINE.

No matter how much of an expert a man may be on gas engine matters, there is only an occasional one, say one in seven hundred and forty-two and a half, who is really expert on the electrical equipment also. Yet the sparking device on an engine is just a little bit more important than anything else; without a good spark you can crank yourself blue in the face and out of the church.

First of all, if you are using dry batteries, and they are perhaps best, after all, for a single cylinder motor, you must remember that they need care; never bump a dry cell or let it get wet. A blow hard enough to dent the outer covering of a battery is sure to be hard enough to break the filling or chemical mass away from the outer zinc which forms one pole or the inner carbon which forms the other pole or element; if this occurs, the amount of surface in contact is lessened and internal resistance is set up, reducing the amount of available current even to the point of infinity.

Water, or even dampness of an overnight dew or mist, causes one of two things, and sometimes both: Internal action and external short-circuiting, both of which reduce the cell to uselessness in an incredibly short time. In practice I have found it well to roll cells in melted paraffine wax, no matter how carefully they are to be boxed up afterwards. There are all sorts of boxes made and sold these days that claim to be mist, fog, damp, water and rain proof, but it is just as well to make sure doubly sure where delays may mean big losses of money or crops.

Take a shallow pan of more than ten inches in diameter and shave into it enough paraffine wax, such as all good housewives use to top their preserves with or face their smoothing irons, to fill the pan to the depth of three-quarters of an inch. When this is thoroughly melted—a very small amount of fire is needed, too much is dangerous as well as wasteful—take each cell in turn by the carbon top and roll it over and over in the wax so as to give it a good chance to get into all the crevices and permeate the paper covering thoroughly. This will stick the paper cylinder tight to the zinc and give you an absolutely safe set of cells in anything except a flood. To make them safe from this calamity means a few moments' more work, but even this is worth while, because you never know what may happen in gas engine practice. Tie your batteries together, or stand them up in a box which makes a tight fit, scrape off any paraffine that may have gotten on to the binding screws or patent terminals, make up your connections with good rubber-covered heavy wire, and pour a little hot wax with a spoon on top of each battery, over wire, terminals and all.

If you have made a good careful job of this part of the work, your battery will work under water and keep indefinitely. If you have the right number of cells, you need not buy a new set for months. The right number of cells is as follows: Find out the voltage of your spark coil when you buy it, and connect up—

Four cells in series for 4½ to 5 volt coil.

Five cells in series for 6 volt coil.

Six cells in series for 7 volt coil.

An insufficient number of cells puts a big strain on and shortens the life of your battery, while too many cells is not good for the coil, and also permits a waste of current, which naturally overworks your battery.

Connecting cells in series is the usual manner, namely, zinc to carbon all the way through. A little extra expense at the start will insure you a saving in the long run; buy two or three times as many cells as your coil requires, connect each set in series, and then the whole in parallel. Two such sets in parallel will last as long as three single sets; three in parallel will last as long as six in the ordinary way.

Wet or Edison-Lalande cells are in a class by themselves, and instructions are always given at the time of purchase, and as they are rather a lengthy matter, and the makers are careful to go fully into details, it is unnecessary for me to give any further pointers here.

In the jump-spark field there are several devices from which to choose. One idea is to have the secondary winding contained in the plug itself, making the whole waterproof and eliminating the heavy and troublesome secondary wrie. Still, that plan is not adaptable to every engine, for there may not be space enough for the large plug and cap necessary in such a system. Then there is the alterna-

Posts the Farmer on Market Conditions

No useless trips to town for the progressive farmer. His Bell Telephone saves him all that.

Malthoid Roofing

We want builders to see us about roofing. We want to demonstrate why it is to your advantage to roof your building with Malthoid Roofing—and we will do this to your complete satisfaction.

We will show you beyond any question that Malthoid is the very highest type of roofing perfection and made so well that it will last as long as the building it covers.
We will show you that Malthoid is a better roofing than shingles—
is more satisfactory than iron—
is cheaper than tin—
in fact, we can prove that there is no other roofing known to the building trades that is as good—
as durable—
as long lasting—
as waterproof—
as fire resisting as cheap as Malthoid Roofing.

It has got every other brand of ready roofing marking time while it is progressing—
there is more of it sold on the Pacific Coast than all other brands combined and it speaks well for the intelligence of builders that this is so.

The makers of Malthoid Roofing know their business for they have been at it for twenty six years and they not only make this roofing to sell but they make it to last and to please the people who buy it.

They would rather have the good will of the builder than his money—and they get both by the way they make Malthoid Roofing.

If you have roof troubles of any kind or of any description—no matter what kind of a roof you have on your building see us at once and we will help you out of your difficulty.

It's free

STRAWBERRY PLANTS

My plants are grown in Tropico and on land never before used for Strawberry Culture. Plants are selected by myself for breeding and the blossoms always picked, therefore the strength grows into the new plants. This is why my stock will produce by far the greatest amount of berries. If you are going to set out 100 or 5000,000 be sure and write to

E. H. LEARNED R. F. D. No. 5, Los Angeles
Grower of Strawberry Plants only, and only the best.

tive of a mechanical vibrator, giving but one spark intsead of a shower of sparks as does the magnetically controlled coil of usual design. This method poduces a great saving in current, which offsets the large first cost of installation. Where there is room and occasion for a magneto, the so-called "magnetic make and break" has won considerable favor. By this method contact is made in the plug by means of a magnet, obviating the usual moving parts and possible leaks that occur in the mechanically operated make and break system. Batteries unfortunately cannot be used to operate this system.

If your engine balks or refuses to fire at all after cranking and priming, turn the flywheel over until the timer is in contact; if there is a good loud buzz from the coil, your batteries and wiring are in good order, and it is time to examine the secondary wiring or plug.

If there is no buzz at all, there is something wrong with your batteries, battery wiring and connections, or the adjustment of the coil. Unless you are perfectly sure of your connections, it is well to take them out one by one and scrape bright and clean, and reconnect tight and firm. The best way to adjust a coil is to unscrew the vibrator contact; screw it until it no longer touches the vibrator itself. Fix the vibrator tension until the vibrator hammer is 3-32 inch from the end of the magnetic core of the coil, and then screw down on the contact point until it barely touches its fellow contact. The lighter the contact, the less current is used and the longer your batteries will last. Never make your contact "harder" than is necessary to keep the engine from skipping at high speeds.

Another thing: It is always well to have an ammeter to test your cells. One bad cell will spoil lots of good ones. If a cell is not up to standard, it is much cheaper to throw it away, or use it on another circuit, say for a small hand lamp, alarm clock or other useful toy. Again, you will save yourself money in buying batteries if you are able to test them at the start to see that they are strong and up to standard; the dealer may be perfectly honest, but now and again a battery gets short-circuited in his store or in packing without his knowing it.—Ex.

THE GOVERNMENT'S IRRIGATED FARMS.

The crop season of 1910 in the West emphasized the value of irrigation as a sure crop producer. It was the best year the farmers have known on the big projects of the government, and many phenomenal crop yields are reported.

The movement of settlers westward continues unabated, but there are yet good opportunities to secure an irrigated farm under one of the big canals of the government. About 400 farms are now open to entry for American citizens.

These farms range in size from twenty to eighty acres of irrigable land, and wherever practicable an additional tract of grazing land has been included, bringing the farm unit up to 160 acres. The cost of water right is from $30 to $60 per acre of irrigable land, and is payable in not more than ten annual instalments, without interest. The farms are in South Dakota, Montana, Wyoming and Oregon.

If you want to engage in poultry raising, if you would like to own a stock farm, or if you prefer to grow apples, truck, sugar beets, alfalfa, or engage in general farming, now is the time to apply for one of these free farms, and a letter addressed to the statistician of the United States Reclamation Service, Washington, D. C., will bring you detailed information on this subject.

Settlers who had only a few hundred dollars to start with have been successful on some projects, but many of the hardships incident to pioneer life will be eliminated and the settler will have much more assurance of success if he has a capital of $1,000 or more.

The lands awaiting settlement are in rapidly growing communities, where schools and churches are already established, railroads are in operation, roads have been built, and telephone service, rural free delivery and other modern luxuries are enjoyed.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Weevils.

How may I kill weevils in beans without heating seeds?—Subscriber.

This may be accomplished through use of carbon bisulphide exposed in a receptacle and left for 12 to 24 hours. Use one pint to 1000 cubic feet.

Grafting Nuts.

I have a walnut tree which grows very small nuts. If I graft some of the limbs to a large variety will the pollen of the large nut improve the quality of the others on same tree?—Old Subscriber, Santa Ana.

The limbs which are grafted over will of course bear the improved nut and the pollen from these grafts would affect trees grown from the other nuts but would not increase size of nuts themselves. The only way to secure this improvement is to graft the entire tree, which is not so serious a task as many imagine. In three years better nuts, and often in greater quantity are produced, so that the loss by the waiting is more than made up.

Taste in Milk.

Bought a cow about three months ago which was in poor condition and milk could not be used because taste and smell were so strong. After feeding alfalfa for a time she increased in flesh and the objectionable taste of milk disappeared, but now for about two weeks it has been worse than ever. Have another cow which is fed the same and gives fine milk. Both have free run of water all the time.—J. D., Ioamosa, Cal.

If the other cow is not affected that locates the trouble in the one cow. Try giving her physic of a pound of Epsom salts in a gallon of warm water. Then after that give every day a cup full of bran with a teaspoonful of baking soda. After a week of this treatment if the trouble does not disappear, she should be turned dry and beefed, as it is a constitutional defect. She probably has some chronic liver trouble that will reappear again and again to cause trouble.—M. E. S.

Soil for Lawn.

What is the best soil for lawn? My soil here at Covina is sandy loam and not very good.—W. C., Covina.

Sandy loam unless it is very light is one of the best soils for blue grass lawn, at least one of the easiest in which to start it. In case it is very sandy a coating over with richer and heavier soil may be advisable. It may also be benefited by heavy application of stable manure which may be thoroughly wetted and spaded in and allowed to lie for a few weeks until seeds have all started. Of course, many consider it objectionable to use stable manure on account of Bermuda grass and other weed seeds introduced, but if thorough cultivation follows the application this objection is overcome.

Paint for Tree Wounds.

What is the best paint or mixture to be applied to fruit trees where large wounds have been made in pruning, and where can it be obtained?—E. B. Stone, Campbell.

Some growers prefer to use ordinary grafting wax, which may be made of one pound beeswax, five pounds resin, one pint linseed oil and one ounce lamp black. This has the disadvantage of having to be kept hot at time of application. This may be done by carrying about on a hot brick. Paint answers the purpose perfectly and is preferred by many because it is less liable to flake off than is the grafting wax. A good lead paint or tar is an antiseptic as well as a protection from moisture. The wax, shellac, tallow and similar applications are not antiseptic. Some even apply Bordeaux mixture, but it allows the drying of the wounded place. Coal tar must be used with care or it will injure the bark of some fruit trees. This is especially true with cherries, peaches and plums. We would suggest as the safest plan the use of ordinary white lead and pure linseed oil.

Tuberculosis.

My cow is apparently healthy, but her nose is often dry and feverish, especially in the evening. Is this an indication of tuberculosis? How can I apply tuberculin test without prohibitory cost?—P., Reedley.

I see no reason to think this cow diseased if the only symptom present is a dry nose. Cows are like people, some have dry noses; some people have dry hot hands. Neither in themselves show diseased conditions. If the cow eats well, does not cough and does not grow very thin, then I see no reason to suspect her of illness. I fear some one has been alarming you about tuberculosis. While it is well to be careful, still a great deal of needless worry has been inflicted on people by scarehead articles.

The tuberculin test applied to one cow costs about five dollars they tell me. When I apply it to a larger number of animals the cost is about fifty cents per cow with the additional cost of replacement of any broken thermometers. The best way to get the cow tested reasonably is to take this matter up in the Grange or among the

GENASCO THE STANDARD OF EXCELLENCE TRADE MARK

Are you befogged?

You can't get befogged about roofing when you steer straight for Genasco, and get it for every building on the farm.

Genasco
Ready Roofing

is made of the only perfect waterproofer—Trinidad Lake Asphalt, Nature's own product. No mystery; no guess-work. Genasco has the life that lasts. Proven by over thirty years' use of natural asphalt.

The Kant-leak Kleet is the greatest help yet in applying roofing. Makes seams positively watertight without cement. Saves time. Enhances beauty of the roof. Supplied with Genasco, when ordered.

Ask your dealer for Genasco. Gold Medal (highest award) Seattle, 1909. Mineral or smooth surface. Look for the hemisphere trademark on the roll. Refuse substitutes of similar looks. Write for samples and the Good Roof Guide Book.

THE FAMOUS REX SPRAYS

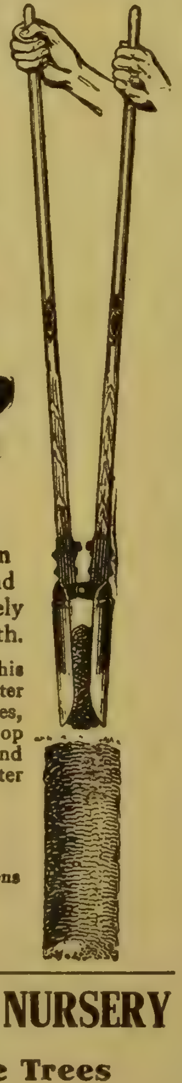
REX LIME AND SULPHUR SOLUTION, the standard insecticide and fungicide, sold by all dealers in the United States. It is absolutely guaranteed to be of 33 Baume Test, and free from sediment. Sold in fifty-gallon barrels.

REX KILTHRIPS (lime, sulphur and tobacco extract), especially prepared at our factory for a summer spray to be used one part to fifty parts of water for orange thrips and thrips on deciduous plants. A positive relief to growers from this pest.

REX ARSENATE OF LEAD, made under the latest scientific formula, containing less than one-half per cent soluble arsenic and less than fifty per cent of moisture. A high-grade article to be used as a summer spray for Codling Moths and like leaf and fruit tree insects.

Ask your dealer, or we solicit correspondence at the factory.

CALIFORNIA REX SPRAY COMPANY, Benicia, California.



Digs Twice as Fast as Bar and Shovel

This Keen Kutter Post Hole Digger, shown here, is a *labor-saving* tool—really is *two* tools in *one*. It takes the place of ordinary bar and shovel and sinks a hole much faster and cleaner.

The two illustrations show how it operates. Simply drive the sharp crucible steel blade of the

KEEN KUTTER
Post Hole Digger

into the soil as you would a common steel crowbar, spread the handles and *lift*. It is *sure* to hold securely and bring up a full load of earth.

Every farmer's tool-house should hold this post hole digger and a full line of Keen Kutter hand farming tools—forks, scythes, hoes, rakes, axes, spades, shovels, corn knives, etc.; and his shop should be equipped with Keen Kutter carpentry and blacksmith tools. Sold under the famous Keen Kutter guarantee, which means satisfaction or money back.

neighbors and see if enough will not unite in meeting the expense to have the university send down a man to do the testing. I believe that you may find more of the neighbors interested in this matter than you think are at the present time. When twenty-five or thirty cows are tested the expense is grealy reduced, perhaps a dollar would cover it completely. A further value to having a university man do the work is that he will make the work into a class, giving instructions, and then after that the dairyman can do his own testing and send the reading to the university to be passed on as to condemnation of animals. The university will furnish the tuberculin in these cases where they know the applicant is capable of applying the test correctly.

An Egg Ration.

Please tell me what is the best kind of food to give to a flock of hens, and what proportion of each to give, to make them lay the most eggs.—Galt.

A balanced ration, to be profitable, often depends upon the availability of local supplies. A good one is: Morning—Mash, alfalfa, steamed over night; in the morning stirred up with mixed feed of 100 pounds wheat bran, 75 pounds corn meal; 100 pounds ground oats, 50 to 75 pounds linseed meal, a little charcoal and salt. Feed all they will eat up clean in thirty minutes. Noon—a not too great ration of green bone, but plenty of vegetables. At night—Grain, varying kinds, thrown in a litter. The modern poultry food preparations can be recommended, as they save time in home mixing, are carefully compounded, and reasonable in price.

Trouble with Turkeys.

I had, three weeks ago, seventy-five as fine, healthy turkeys as one could wish to see—forty-eight hens and twenty-seven gobblers. At that time one gobbler took sick, which I separated from the flock. Within the week twenty-two more gobblers took the same disease. From reading, I infer it is canker.—Q. C. W.

From your description, birds are suffering from canker, which some authorities also classify as roup. Judging from your letter, you must have a malignant case, which will probably result in the destruction of the flock before it can be checked. Remedies in virulent cases are more or less problematical; even when cures are effected, the "cured" birds should not be used as breeders. The disease being infectious, and the Toms fighting more or less, renders them more liable, by reason of even light wounds, than the hens. Experienced breeders do not doctor sick fowl subject to malignant canker or diphtheritic roup.

More Particulars.

Can you tell me something about pruning peach trees from four to seven years old and vines about seven years old?—P. F. D., Selma.

It would be very easy indeed to tell something about pruning peach trees, but the "something" might not even touch the point upon which the inquirer wishes information. The same applies to vines—some varieties of vines (presumably, the inquirer means grapes) are pruned long, some short, and to give full instructions which might reach the needs of the inquirer would require a volume. We mention these points for the benefit of this one inquirer and for many others who write, little thinking the extent of the answer called for. A treatise on pruning can be furnished by the Cultivator at $1.50. It has nearly 600 pages, and still does not exhaust the subject by any means. Past Cultivators also have had pages of material touching upon pruning of deciduous trees and vines. If inquirers will bear in mind and give particular points desired, instead of asking such extensive questions, their queries may be handled more intelligently within the space at our command in this department.

Cost of Raising Turkeys.

What is the cost of raising turkeys to marketable age? Turkeys will be fenced on two and one-half acres alfalfa, but grain must be bought. Prices of grain here, $1.25 for Kaffir, and $1.25 for barley.—Subscriber, Brawley.

We cannot answer, but will ask turkey raisers' experience. Eastern farmers estimate cost at 50 cents each, but, of course, this does not take into account the vast amount of feed secured by the turkey while foraging. In California, and at prevailing prices of grain, the fattening would cost that amount, to say nothing of food while growing.

VETERINARY

Answers in this column by Dr. Fred G. Matthews, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Fracture or Dislocation.

My colt was running and fell over some lumber. Now the leg swings sidewise and when moved sounds are heard at the lower shoulder joint. Is this dislocation or fracture?—V. N. Delano.

Evidently this is a fracture near or involving the elbow-joint as luxation or dislocation of the elbow in the horse is rare, if at all possible. Careful nursing in slings for a period of one month is the only treatment to be recommended. Recovery without lameness is doubtful.—F. G. M.

Skin Disease.

The skin of a hog is breaking and peeling off in large patches. The food consists of barley and skimmed milk. Other pigs associated with this one have not contracted the disease.—Subscriber, Hollister.

This disease would be classed as a form of dermatitis which may originate from various causes. Isolate the pig; change the food; and, after scrubbing the diseased spots with soap and warm water, apply a mixture of equal parts of linseed oil and liquid sulphur. Shake the mixture frequently while applying. Repeat every three days till a cure is effected.—F. G. M.

Capped Hock.

A mule three years old has capped hock. Please prescribe.—Subscriber, Reedley.

Blister the enlargement with red mercuric iodide 1 drachm, mixed in 1 ounce of cerate of cantharides. The application may be repeated after three weeks if desired.—F. G. M.

Red Mange.

A collie dog has a large portion of the skin surface on the under side of the body covered with a much inflamed rash, which is spreading rapidly. Pimples appear with festered points.—Subscriber, Ventura.

The fact that the disease is spreading would lead one to suspect "red" or follicular mange. Apply to the diseased surface, every third day, a mixture of chloroform 1 part, creolin 2 parts, and denatured alcohol 5 parts.—F. G. M.

Money Making Little Liners

In this department we will insert your advertisement under a classified head for 1½ cents per word per issue. No ad accepted for less than 25 cents. Our classified columns are the clearing house for our many thousand readers.

LIVE STOCK.

For Sale—Registered Holstein Bulls; 1 to 2 years old. Some sired by Prince Juliana, brother of former world's record heifer, Juliana De Kol. Dam and granddam, A. R. O. cows. Three record-breakers in some of their pedigrees. M. E. Sherman, Minnewawa Vineyard, Fresno, Calif.

Fistula, Poll Evil, Quittor and all running sores cured permanently by a recent discovery of medical science. Write for particulars. Dr. Fred G. Matthews, Veterinary Bacteriologist, 1232 Central Ave., Los Angeles.

Dividends not called for are added to the deposit account and earn dividends from January 1, 1911. George Tourny, Manager.

Business Notes

MAKING GOLD.

A recipe for making gold is sent out by Geo. C. Roeding of Fresno. It will be of much interest to owners of orchards which have not been as good producers as they should. The secret is very simple and we believe following the method outlined will aid greatly in the making of gold. The little booklet can be slipped into the vest pocket, but it's worth writing for.

One of the most exquisite calendars we have seen this year is that of the California Fruit Exchange, which handles much of the fresh deciduous fruits of the San Joaquin and Sacramento Valleys. The coloring is entirely in brown with the exception of the rich coloring of the California poppy, which is beautifully done in its natural tints. The calendar is suspended by a brown ribbon which harmonizes with it and helps to set off its beauty.

General Agriculture

THE INFLUENCE OF STUBBLE BURNING.

By Alfred J. Ewart, D. Sc., Ph. D., F. L. S., Government Botanist and Professor of Botany in the Melbourne University.

The statement is frequently made that burning off the stubble after a grain crop improves the fertility of the soil and favors the growth of the succeeding crop. This effect is generally ascribed to the alkaline ashes left behind after burning, but since these ashes are no greater in amount than what is returned to the soil when the stubble is plowed in, the only difference could lie in the fact of their being immediately available for absorption by the plant, instead of being slowly set free as the stubble decomposed in the soil.

The experience of others has led them to deny either that stubble burning does improve the fertility of the soil, or that, if there is any effect, it can be due to the ashes of the crop. Mr. Herbert (Journal of Agriculture of South Australia, 1910, page 791) compared the effects of scattering ashes over one plot and burning rubbish on another. The experiment, though a very crude one, showed in favor of the latter plot. In the same Journal, page 967, the explanation is suggested that where stubble burning exercises a beneficial effect on the succeeding crop, this may be due to the effect of the partial sterilization of the soil by heat. Recent investigations have shown that steaming soil, or heating it to 180 degrees Fahrenheit, temporarily destroys the minute animal organisms which feed upon the nitrate-producing and nitrogen-fixing organisms in the soil. As a result, the bacteria increase in numbers and make more nitrogen available for the use of the crop.

As against this explanation, we have the fact that burning off stubble only heats the immediate surface of the soil, and does not appreciably affect the temperature of the deeper layers below the surface inch or two. Even in burning off dense scrub, it is surprising to how small an extent the soil below the surface layers becomes heated. It is only when thick roots smolder away underground, or when the soil contains so much peat or humus as to burn itself, that it becomes strongly heated to any depth. The explanation, therefore, though ingenious, cannot be regarded as definitely established without further proof.

It should be remembered that three classes of bacteria, which render nitrogen available for the use of the plant, exist in the soil. The first group, which we may generally term nitrate bacteria, are concerned in converting the organic nitrogen of the humus in the soil (which ordinary plants cannot use) into nitrates, chiefly of calcium and potassium, which they can freely absorb. This action can only go on when alkaline or alkaline earth bases are present, such as calcium, potassium, magnesium, etc. The addition of such substances in the form of ashes, even if the amount was slight, might temporarily increase the production of nitrates, particularly in acid soils. At the same time, this means that more humus is oxidized and the nitrogen capital of the soil reduced. Further, it is only where the soil contains nitrogenous humus that any such action is possible. Hence, stubble burning not only decreases the amount of humus returned to the soil, but also accelerates the exhaustion of that already present in it. Owing to their high mean temperature, the oxidation of humus is already sufficiently rapid in most Victorian soils.

The second and third classes of bacteria bring the nitrogen of the air, which is useless to the ordinary plant, into combinations which are, or become, available for the plant's use as nitrogenous food. Of these nitrogen-fixing bacteria, one is that which grows in the root-tubercles of Leguminosae and which gives to these plants their special value for enriching the soil with nitrogen. The third group, of which the best known is perhaps the form called Azobacter, grows free in the soil, and is in part responsible for the maintenance or increase of the nitrogen content in virgin soils. The nitrogen-fixing bacteria, which grow free in the soil, can, however, only flourish when they are supplied with carbohydrates such as are provided under natural conditions by the slow decomposition of the plant-remains returned to the soil. If the soil is cropped, and, still more, if the stubble is burnt, the supply of humus soon becomes so small that these nitrogen-fixing soil organisms diminish to a minimum, and the soil loses more nitrogen by waste and drainage than it gains from the air.

In this case also, therefore, burning off the stubble is bound ultimately to produce a diminution in the amount of nitrogen added to the soil by these nitrogen-fixing soil organisms, since it decreases the supply of carbohydrate material on which they live. Steam sterilization, by destroying the small animal organisms which eat these bacteria along with others, might temporarily increase their activity, but such treatment is not, of course, practicable on a large scale. When steam sterilization is used by horticulturalists for destroying weed seeds in manure and potting soil, it apears to cause an increase of nitrogen available for the plant's use, and this may be sufficient to cause excessive leafy growth. Apparently, this is the result of an increase in the bacteria which produce nitrates from humus, and not in the nitrogen-fixing bacteria. Hence, the action will be best shown where large quantities of humus are present, as in stable manure or rich garden soil. Here, a little waste of humus is a comparatively small matter, whereas on an agricultural scale, maintenance of the humus content of the soil is one of the most important factors in preserving its fertility.

The burning of the stubble destroys a few weed seeds, but at the same time the warmth and the resulting ash favor the germination of any hard seeds present in the soil, and also provides precisely those conditions which aid in the spread of fire weeds, some of which easily become troublesome. It makes the impoverishment of virgin soils cropped without manuring take place more rapidly than would otherwise be the case, and it does this without producing any commensurate interest in the crop to compensate for the loss of the capital stored in the soil in the form of nitrogenous plant-food while it was in a virgin condition. It is the act of a spendthrift to burn away in a year or two the capital which was accumulated for him by nature without any effort on his part, and which might, when properly husbanded, have lasted him his whole lifetime.

The use of fire to clear the ground in preparation for cultivation is common among all savage races who practice a more or less rudimentary kind of agriculture, but with the scientific advance of agriculture, fire plays less and less part in its daily doings. Even in a garden, the less the amount of "rubbish" that is burnt, instead of being rotted wherever sufficiently soft and free from weed seeds, the less the amount of manure that will need to be carted in to keep up its fertility. Precisely the same thing applies on a large scale, and to an even greater extent to agriculture. —Journal of Agriculture, N. S. W.

MORE APPLIANCES FOR AGRICULTURAL EDUCATION.

The Oxnard High School has just completed an artesian well at a cost of between $400 and $500. It is a 10-inch well bored to a depth of one hundred and sixty feet. The flow is between seventy-five and one hundred miner's inches. It is said to be the best artesian well in the section.

The school farm has just been graded for irrigation preparatory to putting in school gardens, nursery and special experiments. The agricultural laboratory is one of the best equipped laboratories in the state.

F. H. Bolster, formerly with the Gardena High School, is in charge of the agricultural work of the school.

RUST RESISTANT WHEAT.

Considerable attention is being given by the Department of Agriculture to the breeding of rust-resistant wheats. At the Minnesota Agricultural Experiment Station a "disease plat" is maintained, where the second generations of numerous hybrids between durums and hard spring wheats have been grown and subjected to a severe rust test. The aim is to secure the rust resistance of some of the durum wheats combined with the grain of a hard spring wheat suitable for general purposes. Some promising strains have been selected for future trials.

SAUER KRAUT ON A SMALL SCALE.

No better, surer or more convenient way of preserving cabbage for winter use has yet been devised than that of making into sauer kraut. It is ready on a moment's notice, and will keep until spring.

If you have no kraut cutter, slice with a knife as fine as possible. This is one secret of fine product. Salt to taste, and pack in a barrel or crock.

After one head is thus prepared, pound with a wooden potato masher or block of wood prepared for the purpose until there is a good covering of juice on top. You will be surprised to find how much juice there is in the cabbage.

Keep on slicing and pounding and salting until the crock is nearly full. But leave room for the rise occasioned by fermentation.

Cover well with a cloth, and place a plate or other tight-fitting cover over, then weigh down with a flat stone to keep it entirely under the brine. In two or three days it will commence to "work," and in as many weeks it is tart and ready for use, unless kept too cold.

If too much salt is used, it will kill the acid, and the kraut will soon spoil. The ordinary taste for this condiment will be sufficient test.

SOW SEEDS RIGHT

Sow Seeds Evenly Perfectly—Quickly

Here's the famous Thompson Wheelbarrow Seeder that has meant better stands of alfalfa, clover, timothy, red top, orchard grass, blue grass, etc., for nearly forty years. Over 200,000 now in use—all making big money by increasing crops and saving seed. Sows most uniformly and economically, covers all ground evenly—never wastes seed. Sows any amount to the acre, fast or slow—30 to 50 acres a day. Hopper carried close to the ground—wind does not affect the work of

Thompson's Wheelbarrow Seeder

Works equally well on rough or smooth ground. Lasts a lifetime but quickly pays for itself. Perfectly balanced. Made in every style and size to meet every condition. There's a Thompson for you no matter what seed or how many acres or what quantity to the acre you sow. Lightest, strongest and most durable. Weighs 45 to 50 pounds complete. Large wheel runs easily. Anybody can use it. Absolutely guaranteed.

Send name on postal now for complete catalog showing many styles and sizes. Write quick if interested in increased profits. Address

Scott, Magner & Miller say:

Arrivals of hay for the past week have been 3,191 tons, a slight increase over last week's receipts, which were 2,900 tons.

There has been no noticeable change in the market, either as regards prices or demand. Considerable uneasiness is being felt throughout several of the hay sections owing to the dry weather, which still continues, and holders of hay in the country are quite firm in the prices demanded; so much so that there has been very little country buying during the past week, owing to the fact that hay cannot be bought at these asking prices and brought into San Francisco and sold at the prices prevailing here without a decided loss.

Export demand has also been very light, as well as coastwise shipments. The demand from Washington and Oregon has absolutely stopped for the present at least.

Receipts of alfalfa have been decidedly light, and, although the demand has also been light, prices have been maintained on this commodity.

We quote the wholesale prices in round lots on today's market as follows, viz.:

Fancy wheat	12.50@13.50
No. 1 wheat or wh and oat	10.50@11.50
No. 2 wheat or wh and oat	9.00@10.00
Choice tame oat	11.50@12.00
Other tame oat	8.00@10.50
Wild oat	8.00@10.00
Stock hay	6.00@7.00
Alfalfa, ton	9.00@11.50
Straw	40@50

Grain.

Wheat, No. 1	1.42½@1.47½
Barley, fancy	1.10@1.11¼
Barley, good to choice	1.06¼@1.08¾

Shorts	31.00@32.50

Citrus Market

LOS ANGELES, Dec. 28.

The quietness which usually follows a holiday now obtains in the orange market. Most of the packing houses are still shipping an aggregate of from 70 to 100 cars daily. This is heavy for this season, but, considering the crop to be marketed, none too heavy. If shipments do not exceed this, it is probable the present fairly satisfactory prices will continue. The coming week will notice a material increase, however, and with the constantly improving quality of the fruit, fair prices will probably continue. One most satisfactory feature is the very high quality of the fruit. At this season of the year the state has never made a better showing.

A fair quality of lemons will only command about $2, while extra fancy goods will bring as much as $2.50. This is not high, but there are some shipments being made which will supply the market. Californias are still favorites over any importations.

Shipments.

Shipments of oranges from Southern California since November 1st 3,172, of lemons 666, making a total of 3,838 cars of citrus fruit. To same date last season, orange 898, lemons 546, making a total of 1,444. The year before, 1908, there were 1,339 cars of oranges shipped, 606 lemons, or a total of 1,944.

NEW YORK, Dec. 16.—Eight cars navels, one car Arizonas sold. Market easier on navels, higher on fancy Arizonas, lower on choice. Weather fair and extremely cold.

A FIRELIGHT PARTY.

"A pleasant little holiday entertainment that could be readily copied in any locality was one for which the invitation cards were decorated with tiny pen-and-ink sketches of hearthstones with burning logs thereon," says Mary Dawson, in the Woman's Home Companion for December. "The gathering was named "a firelight party," and the guests were urged in the text to come and read the 'pictures in the fire' on a certain day and date.

"The company arrived on the occasion appointed, to find the living-hall lighted by a genial hickory blaze, which formed the principal illumination, other luminaries in the form of gas and lamps being turned low or extinguished. The fireplace itself was prettily set off with a background of green pine boughs and garlands of hemlock and evergreen.

"After an exchange of greetings, all gathered around the fireplace while the entertainer read aloud the touching passages from 'Our Mutual Friend' where Lizzie Hexam reads the pictures in the glowing firelight for her younger brother. Afterward, paper and pencils were distributed, and each was asked to write a short description of the picture seen in the fire on the present occasion. There were no specifications, each one writing the tale his fancy suggested, without restrictions, save as to time. At the end of ten minutes the papers were collected and read by the hostess, who awarded a framed picture representing a firelight scene for the one considered cleverest.

"The awarding of the prize was followed by a symposium of ghost stories, original or otherwise. A popular novel was presented to the player whose tale was adjudged most hair-raising. Corn was popped, and marshmallows toasted on pointed sticks. Just before adjourning for supper, a clever amateur reader, dressed in old-time costume, came quietly out from the shadows and delighted the company with several love poems, among them Owen Meredith's 'Aux Italiens.' Two of the recitations were delivered with an accompaniment of low music.

"Supper was served at little tables, by candle-light, and consisted of sandwiches, cider, coffee, cookies, nuts and other such homely good things."

THE FARM AUTO.

A correspondent of the Farmer's Tribune, who calls this the auto age in agriculture, says:

Perhaps I need not spell out the word 'auto' in order to give the name of the machine I have reference to for use on the American farm. There may be some prejudice yet in the minds of some against the auto, because it is too high in price. But that will wear away as its real value and varied uses on the farm become better known. Its uses as only and chiefly a pleasure carriage will become reversed, and the pleasure feature be made incidental to its value as a machine to do other work cheaper and better than the horse or hand of man. Whatever else the auto machine may not be able to do cheaper and better than any other power, it has already been settled by actual trials this year on the large Graham farms near Washington, Indiana, that with its gasoline geared traction engine it will pull from eight to fourteen plows and harrows, haul grain to market, pull or push the threshing machine, and do most anything that horse or man power can do and at much less expense.

I cannot here give the particulars; I can merely call attention to the general merits that are in the machine so as to get it investigated by interested parties. Motor power in the auto machine has been supposed to be too high priced for all to have it. That may have been true at the start, but prices will come down, and the buying capacity of the farmers can go up —even if they have to form "rings" to accomplish it. The matter of getting an auto big enough to plow and harrow can start with a farmers' combine of several persons as stockholders and in the same neighborhood, for such a machine will plow and harrow from 25 to 30 acres in a day. Of course this new motor power will have to have some time to come into more general use, but the fact that its mission as a labor saver is fixed, in my opinion, proves that the machine has come to stay.

Another fact is also pretty well settled and that is that farming is our chief business and that it will lead all others. This fact ought to bring the auto to the front for investigation. Its real merits are only as yet known to the more well-to-do financially and for pleasure purposes; but this is far from being the limitation of its lines of usefulness to man. As horse and man will soon become too scarce and expensive as laborers this motor auto can take their places. The farmer ought to look up the auto, which already is his best friend.

To show in a single item what this auto will bring in progress to the farm, let us apply it in a practical way to the plow and harrow. At present we will assume that from one to half a dozen adults own and run a farm. With the old style plow, one person follows on foot behind the team that makes one furrow. By evening he has plowed two to two and a half acres and is tired; so is the team. But that same person as chauffeur of an auto can ride all day, and with less care than the team requires. He can direct a half dozen or more plows and harrows to suit.

Furthermore, such a person can, if necessary, by himself, or other joint owners, run the auto all night long. The horses get tired but the auto does not. And we can all see that when the auto is not at work it does neither eat nor drink like the horse. If a single farmer does not feel able to buy an auto, a half dozen or more can form a ring and run it by the different owners exchanging labor, for one person can do more work with an auto than a half dozen persons with teams.

BLOOD MEAL A CALF TONIC.

Dried blood or blood meal is an excellent tonic for calves. It is especially valuable as a preventive of scours caused by stomach disorders. Mild cases of scours can be cured in a few days' time by reducing the regular feed of milk and adding to the remaining portion a teaspoonful of dried blood at each mealtime. Weak calves suffering from chronic scours may have a tablespoonful instead of merely a teaspoonful. When dried blood meal is added to milk for the calves it should be thoroughly mixed with the milk before the calf is allowed to drink. Besides being a tonic blood meal is also a rich food for the calves and aids their condition directly.

Don't allow anyone to smoke around the stable. It is not only dangerous, but the milk is liable to be tainted.

To produce their full milk-giving capacity cows should be kept as free from disturbance as possible.

There should be good light, good ventilation and good drainage in the stable.

FRIENDLY MESSAGES

Second King—What mean ye, shepherds?

Second Shepherd—Hear, O King!
Give ear unto a wondrous thing.
We sat and watched our flocks last night,
When suddenly the heavens were bright
As though a thousand mornings shone.
Amid that light we saw a throne,
But not who sat thereon. Below
We saw the angels come and go,
Glorious and gracious to behold,
With shining wings and harps of gold.
They touched their harps, and sang a song
So low and sweet, so loud and strong
One might live on it his whole life long.
We knew not half the angels sung,
For it was in an unknown tongue;
But the refrain thereof was plain
(O, may it never cease again!)
"Glory to God!" it ran, and then,
"Good will on earth, and peace to men!"

—Richard Henry Stoddard, in Masque of the Kings.

A PROFITABLE CALL.

Rousing himself from a sound sleep, Dr. Stone realized that his door bell was ringing loudly. Throwing up the window, he looked out. As it was past midnight, and pitch dark, he could see nothing.

"Who's there?" he demanded.

"Is Dr. Stone in?" a strange voice asked.

"Yes," the physician replied. "What's wanted?"

"Well, Doctor, my name's Jones. Perhaps you don't remember me, but I've met you."

"I don't recall the name," returned the doctor, much annoyed at being disturbed.

"Well, that doesn't matter," replied the stranger. "The fact is, Doctor, I have a very sick child, and wish you to visit her. Can you come?"

"How far is it?" questioned Stone, getting interested. As he had not been established in business very long, he was extremely anxious to answer all calls.

"About five miles out in the country," replied the stranger. "I'll pay you well for your trouble."

"All right. I'll be right down," and the doctor closed the window.

As Stone proceeded to dress, his wife, who had been aroused by the noise, asked: "What is it, George? A call?"

"Yes," he answered, hurriedly.

"Who is ill?"

"Some child. That's all I know now."

"I do wish you wouldn't answer any calls at night," his wife complained. "I hate to stay here alone."

"But I must go, dear. A doctor should never shirk his duty." And he put the finishing touches to his toilet.

"I'm glad I've got my automobile," he continued, endeavoring to change the subject. "It's certainly handy to jump right in and pull a lever and let her go. It's much better than bothering with a horse. But I must hurry. Now, don't worry. I'll soon be back."

Leaning over, he kissed his wife, and passed from the room. On opening the front door, he found himself confronted by a short, thick-set man, carrying a satchel.

"I suppose you have no objection to my accompanying you?" asked the stranger.

"Not in the least," replied the doctor, closing the door. "Wait here; I'll have the machine out in no time."

"Machine?" queried the stranger, as if much surprised.

"Yes—my automobile," returned Stone, hurrying around the house.

"Oh, that's so much the better. We'll get there sooner," the stranger called after him.

In a few moments they were speeding over the main street of the town, leaving a cloud of dust in their wake. Not a person was to be seen; the entire population was evidently lost in the land of dreams.

The doctor increased the speed, notch by notch, until they were fairly flying over the dusty road, and they soon left the sleepy town behind them.

"What seems to be the trouble with the girl?" asked Stone, keeping his gaze fixed straight ahead on the road before him.

"Oh, I guess it's nothing very serious," replied the man, in a harsh voice. "You had better slow up a bit. I want to learn how to run this thing."

"Eh!" ejaculated Stone, raising his eyes from the road and looking toward his companion. He found himself looking straight into the barrel of a pistol held in the hand of the smiling stranger.

"What — what — what does this mean?" he stammered, throwing off the power and allowing the car to run under its own momentum, while he glared at the man at his side, upon whose face there was a determined expression.

"Mean?" the man replied. "It simply means that I wanted to get away from that town."

"Then there is no one sick?" queried Stone.

"No. That was simply a ruse on my part."

At this moment the car came to a stop in the middle of the road, and Stone released his hold upon the steering wheel. His first thought was that he had a crazy man to deal with. He decided to humor him until help of some kind could be obtained.

"Where do you want to go?" the doctor asked, with forced calmness, looking intently at the man.

"To the next town," he replied, still menacing the doctor with his pistol. "I know where it is—twenty miles away. Get me there as soon as possible. I must get away from here."

"All right, I'll take you there," Stone answered, "and we'll get there in a hurry, too. I'll show you how fast this thing can go." And the doctor once more started the car.

"Yes, let her out to the limit," the other ordered, with a harsh laugh.

Stone did as he was bid, and they were soon speeding over the roads at a fast clip. The doctor saw no way but to obey the crazy man, for that he was crazy he had not the least doubt. He still kept him covered with the pistol. Who but one deranged would have acted as this man had?

"Slow up now!" the man cried suddenly. "I want to learn how this thing goes. After I learn, you can get out. That's right," he continued, as the doctor obeyed him, "slow up, and give me all the details. But I warn you not to try any monkey business. I've got you covered; and at the first move I shall not hesitate to shoot."

Stone was tempted to take a chance

and grapple with the man. But upon second thought he gave it up. If the stranger had been unarmed, he would not have hesitated a moment, but he concluded it would be madness to try it while the man held the pistol. But something must be done, and that right speedily, for there was no telling what crazy actions the man might take it into his head to do.

"Come!" growled the man, uneasily. "Get busy, and show me how it works."

"All right," began Stone. "This is how it works," pressing a lever. "That makes it go ahead. This one," pressing another, "stops it. The speed is regulated by this one. It's quite simple, after all.

The man watcehd the doctor's every move. The wild look in his eyes had disappeared, and his mind seemed centered upon the working of the machine.

Stone did not betray any signs of nervousness now. Already he was revolving in his mind a plan to turn the tables upon his captor, and his set jaw accentuated the determination of his purpose.

"This lever regulates the speed," he repeated, casually. "I'll throw it ahead a little."

The car was now covering the ground at a good pace.

"Let it out for a few miles," the man commanded. "After that, you can slow up, and get out and leave the car to me."

The doctor started at this command. He wasn't sure now whether the man was crazy or was only intent upon stealing his car. He now seemed rational enough.

"Very well, I'll do as you say. But here's something I forgot to tell you. See that little foot-lever there in front of you—down on the floor, close by the dashboard?"

"Which one?" asked the man, leaning forward a little.

"That one—the small one at the right of the other one. See it? Look close."

The man leaned further forward in his endeavor to see it.

"I don't"——

At that moment, with a sudden jar, the car came to a stop, and the man shot over the dashboard—the position Stone had gotten him into had been just the one he wanted—and landed on the edge of the road, about ten feet ahead, and lay still.

At the same time the doctor had braced himself for the shock, and as the other landed in the road he threw on the power, the car shot ahead, and passed the prostrate figure before it showed any signs of life.

He had covered perhaps about a hundred feet when he heard shots in rapid succession, and bullets whizzed dangerously close to his head. But he kept on, and was soon out of range.

Then a daring plan entered the doctor's head as he slowed down the car. Why not try to capture the man? He was too dangerous to be at large, as there was no telling what he would do next. He knew the fellow's pistol must be empty, for he had counted the shots. If he hurried, he might reach him before he had a chance to reload the weapon.

Quickly turning the car, he started back. As he approached the spot, he slowed up. A dark object sat by the roadside. The doctor stoped the car and sprang out, determined to put up a good fight if the man showed resistance.

"The game's up," the man said, as he looked up and saw the doctor. "I've got a broken leg, or you wouldn't have found me here. I emptied my pistol, too, and I haven't any more cartridges."

"I'm sorry you got hurt," replied Stone, "but it was the only way."

"Oh, I don't blame you," returned the man. "I took a chance, and lost, that's all. But get me away from here —anywhere—so I can have my leg fixed up."

"I'll take you back to town," replied the doctor, and after some trouble the man was placed in the car and the return trip began. It did not take long to cover the distance, and the car was soon speeding up the main street. The doctor intended to take the man directly to his own house, where he could give him the best attention. As they approached the business section, a crowd of people was noticed in front of the bank. As he stopped the car, a man cried:

"Hello, Doctor! Where have you been at this late hour?"

"Just taking a little spin," he answered, carelessly. "But what's the trouble here?" he added.

"The bank's been robbed," replied the man, who was no other than the chief of police, advancing toward the car. "The watchman was found bound and gagged, and the money gone. We were about to start a hunt for the robber. He can't be far away."

"Well, I'd like to help you," returned Stone, "but I must take this man home and fix him up. He's got a broken leg. Here, take this," and he handed the satchel to the chief, who, taking it, was about to walk off, when in some manner it flew open, revealing many packages of bank notes.

"What's this?" exclaimed the chief, in amazement. "Where did you get this?"

"This man had it in his possession, Chief," replied the astonished doctor.

"Then he must be the robber," answered the chief.

Such proved to be the case, as the cashier of the bank, arriving at that moment, identified the money as belonging to the bank.

The man was soon in jail, where his wounded leg was attended to. The robber seemed to lose his nerve when once behind prison bars. He broke down, and confessed all. He had carefully laid his plans. Knowing there was no train out of town until eight o'clock the next morning—too late for a safe get-away—and knowing there was one from the next town at a much earlier hour, he had carefully planned to catch it, making use of the doctor's car to do it. He would probably have succeeded had not the doctor adopted the means he had used to overcome him.

It turned out later that the man was a noted bank robber, a thousand dollars' reward being offered for his capture. This the doctor received, and when it was added to the substantial sum the officials of the bank gave him, the doctor admitted that the call had been a very profitable one.—Country Gentleman.

Sievert Distillate Oil Burners

the most efficient all round Heating appliances forStoves, Ranges, Boilers, Water-Heaters, and especially Hot Air Furnaces of all kinds. Brooder House and Heating Stoves. Send for Free Circulars.

THE RUDE BARBER.

A farmer from Minnesota entered a barber shop at Butte for the purpose of getting his hair cut. The rural one's locks had an odd, ragged look and, after regarding them scornfully for a moment, the barber demanded brusquely:

"Say, who cut your hair the last time?"

"My wife," said the farmer, with an uneasy smile.

"She did, eh?" said the barber. "What did she do it with—a knife and fork?"—Lippincott's.

Life is so sweet that even at 40 a man does not like to think that he has lived half of it.

Nobody really enjoys being poor, but anybody would rather be here in that condition than not at all.

Every day that we spend without learning something is a day lost.—

"ANDREAS HOFER," IMPORTED SAANEN BUCK.

(See article on page 666.)

THE OLEO TAX.

The present oleomargarine law which provides for a tax of 10 cents per pound upon artificial colored oleomargarine, does not prevent fraud in the sale of oleomargarine. Congress intended to make the manufacture of yellow oleomargarine unprofitable so that oleomargarine should not be made to look like butter. In framing the law Congress failed to "reckon with its host." The manufacturers of this butter substitute soon devised means for producing their product without artificially coloring it. So largely is this done that only enough tubs of artificially colored oleomargarine is produced to furnish enough packages from which to sell the yellow stuff from stamped packages into which tub after tub is emptied before the original tub is quite empty. Dealers are not required to destroy the stamp until the tub is empty, hence it takes a long time to empty it.

In doing this, even when selling the product for just what it is, the dealer can demand an exorbitant price (just a few cents less than for butter) and throw the blame on the 10-cent tax, when in reality the stuff is taxed at only ¼ of a cent per pound.

This fact should be kept in mind: Less than 3 per cent of the oleomargarine put upon the market has been tax paid at 10 cents per pound. Quote this when an uninformed friend refers to that "burdensome tax" on oleomargarine.

The present law needs amending so that it will prevent fraud. Oleomargarine men insist that its weakness is a reason for its repeal. The National Dairy Union insists that its weakness is a reason for its amendment so that it will be effective in preventing fraud.

GREAT BUTTER PRODUCER.

One thousand and thirty-seven pounds of milk, testing 6.45 per cent fat, and yielding 66.9 pounds of butter fat—this is the July record of Rouge 2nd of Brookfield, a two and one-half year old heifer owned by Iowa State College. This phenomenal heifer began her record the 15th of last January. In the six and one-half months from then until August 1 she produced $116.92 worth of butter fat. After deducting the cost of feed this left a net profit of $68.20. The total amount of milk produced in this time was 6778.8 pounds, and of butter fat 362.59 pounds.

Counting the Cost—"So you want to marry my daughter, do you, young man?"

"Y-e-s, s-i-r."

"Well, can you support a family "

"H-how many are there of you, s-sir?"

QUESTIONS.

Are you planning with your children for happy winter evenings?

Are you feeding your mind with the care you feed your stock?

Are you dreading worse things or are you hoping better things?

Are you making profit by brain work this winter, or waiting to make profit by muscle work next summer?—Spokesman Review.

BOTH STRONG.

"For a moment," he related, "I held my breath."

"My!" she interrupted, admiringly. "How strong you must be!"

He edged away, blushed, and felt in his vest pocket for a clove.—London Telegraph.

Tommy—Pop, does the earth go round?

Tommy's Pop—Yes, my son. But it wouldn't if it was divided among all the people who want it.—Philadelphia Record.

THE CAVITY.

Cholly—The dentist told me I had a large cavity that needed filling.

Ethel—Did he recommend any special course of study?

Mary had a little skirt
  So tight below her knees
That she could neither run nor walk
  And didn't dare to sneeze.
—Cleveland Plain Dealer.

Mrs. X—I despise that woman. She tries to make a cloak of religion.

Mrs. Y—Yes, and she hasn't enough of it to make her a decent bathing suit.—Boston Transcript.

WHY HE WAS WAITING.

"What are you waiting around here for?" asked the officer of a sailor who was standing at the door of a church where a wedding was taking place.

"Waitin' to see the tied go out, sir," replied the sailor, touching his hat.—Yonkers Statesman.

Here is Andrew Carnegie's recipe for securing a good wife: "Pick a girl who takes care of her mother—the girl who is useful in the household and does not make the most show in the ball room." Andrew knows quite a number of things besides the secret of making money.

"What? Fell downstairs! How did it happen?"

"Why, you see, I started to go down, and my wife said: 'Be careful, John!' And I'm not the man to be dictated to by any woman."
